# THE BUILDING NEWS

## AND ENGINEERING JOURNAL.

### SCALE.

WE are not about to speak of the scales used in drawing, but of that measure of proportion between the parts of a design by which the eye is apt to judge of the size of a building. If we take three isolated buildings of equal elevation and width, and divide one of them into two parts or stories, another into three stories, and the third into four stories, the impression on our minds will be that the four-storied house is the highest and largest, the three-story one is less large, and the two-story building the smallest, as the eye is disposed to measure the height by the number of divisions, and not by the actual dimensions. Place them together, and the eye immediately perceives the equality of the height, though the width of the four-storied building looks the greatest. This kind of optical phenomenon is of a relative kind. The only absolute scale we have to go by is the height of the human figure, and it is this alone by which we can measure mentally the height or size of a building. The parts of a great building are larger than those of a small one; the stories, or horizontal divisions, are higher—hence the eye is frequently misled by the real dimensions of a great edifice. We have all heard of the singular want of scale to be found in St. Peter's at Rome, where the colossal single order deceives the eye, and the large scale of sculptured figures on the interior piers reduces amazingly to the eye the real size of the interior. The impression of magnitude is not felt. Till the visitor actually stands beneath the great vault of nave or measures himself next one of the colossal piers or the moulded bases of the pilasters, he has no idea of the vastness of the building. The same wonder is excited, though in a less marked degree, when we view any large-featured edifice from a distance, and then go up to it or enter it. Who has not been surprised at the height and size of the columns which adorn the colonnade of the British Museum, when he ascends the steps of the portico? In the street opposite, the colonnade looks long and low, and the actual magnitude of the front cannot be estimated till one actually goes up and stands under the portico, or observes the height of a man near the columns. The surprise would not be so great were we to see the front divided into three or four stories, for then the eye could estimate at once the actual dimensions both of length and height. The west front of St. Paul's looks majestic at a distance, because it has, instead of one colossal, two orders of columns, and it has other buildings near it from which we can judge of its relative size. The vastness of a simple-lined structure like the Pyramids, is lost in the boundless open area of the desert, so if we were to drop a single—"order" edifice like the British

Museum, down into an open waste, it, too, would appear small comparatively, till we were actually close beside it. The lesson we have to draw from these parallels is of importance to the architect. Great size in building may be lost to the thousands who never enter the building when it is situated in a large and unconfined space of ground with nothing near it to give scale. Is it preferable that a public building should be imposing only when we enter it, that it should then overawe us by its magnitude—or should it appear great to the thousands that see it at a distance? Upon this question will depend the answer, Whether it is better to magnify the size of the parts, or to multiply and subdivide them? Which is the most allowable form of creating an architectural impression—by making the units large and few, or by multiplicity of small parts?

We may mention many examples of both of these forms. The Greek temple was an exemplification of the first; the column with its base and capital became the unit of measurement, in the modern city building we find the other principle—namely, division—carried out. One modern edifice illustrates the latter modes of proportion—namely, the Houses of Legislature, and perhaps it would be difficult to find another great work in which the division of parts is carried to a greater extent, or one that tends to the defect of littleness and fritter. Certainly that building, noble as are its masses and outline, is spoilt by multiplicity of division, and is an instructive example of ordinary sized apertures applied to a large edifice. Still the houses would lose in apparent extent if a larger unit-division or bolder detail had been employed. The greater parts of the river front are estimated by these bays; but the panelling looks small and far too delicate for a great front. The eye is distracted with repetition of panel and bay. However beautiful in design, the scale of the detail is more suited for a college quadrangle or a private residence than a large public edifice. Every building needs a certain scale of its own. What makes a fair window-opening to a private house is much too small for a building with large rooms and greater dimensions—a town-hall, for example, and after all said, the only standard of scale is the use which the building is intended to serve. It would be odd, for example, to see a municipal building pierced by windows of the same size as those of an ordinary dwelling, or to make a number of small openings to light a public hall. The size of windows in every case ought to be proportioned to the function of the room. In some large buildings, and notably the huge blocks of workmen's dwellings, this rule cannot be obeyed; hence we have the unsightly rows of small windows on every story. The

rooms are of small size, and are repetitions on each floor. The Peabody Dwellings afford us instances of a multiplication of small windows. A little architectural arrangement would have grouped the windows together on some floors so as to have given some variety to the apertures without sacrificing the scale of the building. We refer to the window, as it is in many buildings the chief unit of scale by which the real extent of the structure can be judged by the eye. The doorway is another great unit of scale. How large it should be in any given building is a question that must solely be determined by the considerations of function and architectural dignity, which may cause it to vary from the dimensions of stately portals, like that of Rheims or Chartres, to an insignificant opening, only large enough to admit two or three persons at a time. We may not then with any exactitude look upon the doorway as invariably being a unit of measurement to the eye. The great French cathedrals, with their noble façades, might have looked larger if it had not been for the grand triple doorways which adorn their west fronts; but certainly they would have lost in importance and dignity by smaller doorways. We now measure the real dimensions of those doorways by their proximity to the dwellings which surround them, which in some instances cling to their walls; or by the serried rows of statues of saints and martyrs which tenant the members of their arches and jambs. When the visitor gets close enough to realise the heights and grand scale of these portals, their stately arches and sculptured tympanæ, he begins to be overawed by their size. A very instructive instance of the effect of scale is afforded by the west front of Wells Cathedral. Has the reader ever noticed the very small and insignificant proportions of the doorways to the nave and aisles? Beautiful in detail and proportions, they are exceedingly small for the other features of this front. They certainly give real scale to the edifice, but they are not grand enough for the rest of the front. They show exactly the opposite treatment to that adopted by the Frankish architects. At Peterborough vastness is given to the west front by the grand portal of three lofty arches, in this respect rivaling its Continental sisters. Scale in this instance is obtained only by comparing the real doorways and the inclosed galilee or porch.

Attention must be drawn to the details to realise the real size. But there is a grandeur in the design which gives it a unique interest amongst cathedral churches everywhere. In the sculptured Salisbury screen front we have, on the other hand, subdivision carried to a great extent in the

tiers of sculptured figures. They give a real scale to the proportions, though there is a sacrifice of nobility. We learn from all these and other examples that scale can be obtained in other ways than by making small doors and windows and niches. We may have grand portals and divisions, but these may be subdivided by smaller features. We need not sacrifice breadth or sublimity in our great buildings—by all means let us have noble proportions of windows and doorways; but let us take care to express scale by detail, by subdivision of wall surface, as the old architects seldom failed to do. Scale must be indicated. If a design is broken up into a few great parts, we must take care to give them effect by introducing smaller breaks, niches, panels, or figure sculpture, and such markings by horizontal lines as will indicate some unit—namely, the proportions of the human figure. We must avoid making the columns too big without fluting them, window openings too great in width and height without subdivisions by mullions or tracery, or doorways without dividing them by pillars. Even the large wall surfaces can be subdivided by ornament, sculpture, or even by rustications and quoins. And one word of advice is necessary to those who think boldness a virtue in every position. The lower or entrance story of a building should, in its subdivisions and details, bear a definite relation to the human figure, even if in the upper stories greater boldness of dimension prevail.

#### BUILDERS' MORTGAGES.

THE many risks that are run by those who lend their money upon leasehold properties have often been shown in our Courts, and the soundness of these securities has frequently been much shaken. Losses have occurred to the lenders in various ways through the fraud of the borrowers, and the question which of two innocent parties must bear that loss has been made the subject of constant litigation. A novel and ingenious form of fraud was disclosed in the case of "Union Bank of London v. Kent and Others" (*Times*, 23rd June), which has just been decided by the Court of Appeal, and which is of much general interest and importance, especially as it proceeds upon facts which may every day be repeated with similar results. The plaintiffs were mortgagees of a building agreement upon which they had advanced money. It was a term of this mortgage that the mortgagors should proceed to apply to the freeholders and granters of the building agreement for proper leases, and that, having obtained them, they should mortgage those leases to the plaintiffs by way of demise, and so complete their security over the property by giving them, in effect, the legal estate; but the mortgagors having obtained the leases in their own names from the freeholders, forthwith deposited the same with Messrs. Brown, Jansen and Co., the bankers, who were the defendants in this action, to secure advances, of course concealing the prior mortgage of the property upon the building agreement to the plaintiffs. Thus the question arose, Which of these two mortgagees should take priority, or, in other words, which of these two innocent parties should bear the loss occasioned by the fraud of the mortgagors? They had both acted *bonâ fide*, and it was not easy to see what more either could have done in the way of precaution and inquiry, having regard to the common usages of bankers and men of business, who cannot be expected to foresee every possible contingency. It was contended for the plaintiffs that they were entitled to priority on the ground that their mortgage was prior in date to the defendants, and that they had not lost their equitable right to priority by any act of negligence on their part. The defendants submitted that

the plaintiffs, to have perfected their security, should have given notice of the mortgage of the building agreement to the freeholders, who, in that case, should have abstained from granting the leases, and that by omitting to give this notice they were guilty of negligence, and thus they lost their rights of priority as first mortgagees, and ought to be postponed to the defendants, who were mortgagees of the legal estate.

At the trial in the court below, however, Mr. Justice Chitty gave judgment for the plaintiffs, declining to adopt the defendants' argument as to the duty of the plaintiffs in regard to notice. He pointed out that the plaintiffs' agreement with the mortgagors was that these, as the borrowers, should obtain the legal estate themselves—i.e., should obtain the leases in their own names. The mortgage stipulated that the mortgagors having so obtained the leases should mortgage them in due legal form, by way of demise or under-lease to the plaintiffs, in order to complete their security. The mortgage was not to be by way of assignment, for that would have made the plaintiffs liable upon all the lessee's covenants, but by way of demise or under-lease, when such liability would be evaded. It followed from this arrangement that it was essential that the mortgagors should first obtain the leases in their own names, before they could grant the mortgage by way of under-lease. As a consequence of their position, notice to the freeholders not to grant the leases would have defeated the whole plan, and would have prevented the plaintiffs from ever completing their security if that notice had been effectual. But, in truth, it would probably have been as useless as it was unnecessary, for the freeholders would not have been in any way bound by the notice, or obliged to recognise the existence of the mortgage of the agreement, and they would have been entitled, if not compelled, to grant the leases to the builders and mortgagors in accordance with the agreement made for that very purpose.

The Judge, acting upon this view of the rights and duties of the plaintiffs, held that the legal estate possessed by the defendants was no protection against the plaintiffs' prior equity, because there had been no negligence on the part of the first mortgagees by which the claim based upon their priority could be defeated. He laid it down generally that in regard to charges of land, priority of security did not depend upon notice, although in some cases of contract it might be necessary to give such notice to the holder of the legal estate in order to prevent its being conveyed away. But that rule could not apply to this case, or any similar one, because the legal mortgagees had no right to intercept the legal estate, the creation of which, in their mortgagors was in fact necessary to enable them to obtain that completion of their security for which their mortgage provided.

In the Court of Appeal this judgment was supported, although partly upon somewhat broader grounds. The question was there put as being whether the defendants, being holders of the legal estate without notice, were entitled to take priority over the earlier equitable charge of the plaintiffs, which, of course, comes to the same thing. The defendants, in short, really relied upon the fact that they had obtained possession of the actual leases granted to the mortgagors as security for their advances. But the Lords Justices pointed out that this was not enough to give them the title they claimed. In order to oust the earlier mortgage of the plaintiffs, it must be shown by the defendants that their possession of the leases, by means of which they were defrauded out of their money, arose from some default or negligence on the part of the first mortgagees. The only negligence alleged against them was their omission to give notice of the mortgage of

the building agreement to the freeholders or lessors. It was urged that if such a notice had been given the lease would not have been handed over to the mortgagors without inquiry. But the Court of Appeal held it to be a well-established rule that notice was not necessary to perfect a security of this character, and they thought that it would be introducing a dangerous novelty if the defendants' view of the matter were adopted. Notice was, of course, required in some cases, different from the present, and the Court finally held that the plaintiffs, as first mortgagors, could not be postponed to the defendants' later mortgage, merely because the latter had obtained possession of the leases, and the former had not given that notice which was not legally necessary, and to which the freeholders need not have paid any attention. The result of this judgment is to show that lending money upon building agreements and building leases is but a risky business. Where an advance is made upon a building agreement, subject to the mortgagor's covenant to complete the security, when he gets his leases, it would be as well, if possible, to give notice to the freeholder with a view to finding out when these leases are granted. Difficulties will often arise in doing this, because the builder will not like his credit to be damaged. But it is obvious that though in this case the first mortgagees succeeded, in another where the facts were even slightly different, notice might be deemed necessary. As to lending money upon the actual leases themselves, as the defendants did here, it is difficult to see how all risk of prior charges can possibly be guarded against. Fraud cannot always be presumed or prevented. But, in truth, the only real remedy for this state of things is to be found in such a system of compulsory registration as will enable every prior charge upon property to be discovered by simply searching at an office.

#### FRONTAGES OF CORNER BUILDINGS.

WE have lately heard a good deal more than is agreeable as to how the law of building lines and other matters has been administered in the Metropolis. Since certain disclosures, it is now not very remarkable why one building should have been kept back and another brought forward, and why an irreconcilable difference of rules exists as to building generally. We have often asked how these things were, and expressed our astonishment at the laxity of administration exhibited. People wondered, but builders who were adepts in the mysteries of Metropolitan building law knew that the Building Acts could be set aside whenever certain authorities so ruled. We have before called attention to the infringements of public rights, and the rule as to corner houses. As our readers who have studied the question are aware, some difficulty has arisen as to what lines of frontage a corner house is to keep. The latest legal decision is the De Vere-gardens (Kensington) case, in which the Court of Appeal overruled the Vice-Chancellor and upheld the magistrates' order for the demolition of the side front, which was in advance of the general line as defined by the superintending architect. By this decision the flank wall of a corner house is to be set back to the general line unless the Metropolitan Board of Works give their consent to an advanced line. The consent of the Board has been obtained in many instances, but greatly to the prejudice of the public and adjoining owners. In our last issue we gave an important comment on this case by Lord Herschell, made before the Commission of Inquiry now sitting on the Board of Works. He therein observes:—"I think if the judgment (De Vere-gardens case) is carefully examined, it will be found that more than one, if not all, of the lords

who delivered judgment in that case expressly pointed out that a house might be in more than one row for the purpose of fixing the building line, and I do not think that any of them rested their judgment in the slightest degree on the fact as to its being the front of the house or the side of the house that was in De Vere-gardens. I should say most emphatically in my view it would not make the slightest difference whether it flanks or fronts. The building cannot come out beyond the row of houses in which it stands because it is the corner of a street and fronts into a side street, and the flank only comes out. It would be, in fact, the most objectionable form of projection." We have here an important construction on the case that is not in accord with the opinion held by many, that the decision applied to corner buildings which fronted a side street. The point is here at least established that a corner house must be regulated by the general line of frontages of both streets. In one of the reported cases, the magistrate decided that in the matter of a shop erected at the corner of two roads in advance of the line of one of them, it was not necessary that the builder should conform to the line in the side road. A contrary case may be mentioned. A corner plot of ground is let on lease, having a frontage to two roads—one of them a main road, and the other a side road. On the opposite side of the latter road is a house extending to the pavement, the others set back some feet. A building is erected on the corner plot, and the vestry compelled the builder to set back the side frontage to a line fixed by the architects of the Metropolitan Board on their application. This line had the effect of materially narrowing the frontage. The question whether the side frontage of a house should conform to the line of fronts in the road is a disputable point. Some of the magistrates have ruled that if a building is situated in the main road it is not necessary that it should be in a line with houses in the side street, a decision which has allowed houses to be erected to the detriment of owners of property adjoining. The 75th section of the Metropolitan Management Act empowers the Metropolitan Board or their architects to decide the general line of buildings in any street, place, or row of houses; but, unfortunately, consent is too often granted to override this decision, and there is no appeal. There are, it is true, certain rules to be observed, intended to protect the adjoining owners, one of which is that persons interested are to be heard by the superintending architect.

We think it is desirable that all corner sites should be staked out by the authorities as soon as new buildings are contemplated, so that the frontage lines may be understood. It is evident that the purchaser or lessee of a corner plot may be a loser when both frontage lines are set back to a general line. The effect, for instance, of setting back, say, 10ft. on one front, and 5ft. on the other, would be to curtail the area of an ordinary house 450 to 500ft., or at least half. Yet the corner house becomes a guide to houses in both streets, and its influence for good or bad must be felt. Under these circumstances, the decision laid down in the De Vere-gardens case, and interpreted by Lord Herschell, is of great significance to lessees. All that is needed is an impartial administration of the provisions of the Act. Great injustice is done to owners of houses by consent being given to allow a frontage to stand out several feet in advance of buildings on either side of it. The adjoining owners are sometimes apathetic, and allow the building to obstruct their view before they begin to find out a serious injury has been inflicted on them; they then begin to protest, but it is too late. The height to

which buildings in the Metropolis can be built is also governed more by consent than law, as we lately pointed out, and we hope the proposal to give the London Council powers to restrict the excessive height of buildings in existing streets will be carried. There is now no power to limit height.

#### THE METROPOLITAN BOARD OF WORKS INQUIRY.

THE Royal Commissioners continued their investigations into the proceedings of the Metropolitan Board of Works at the Westminster Sessions House on Friday.

Mr. Richard Frost stated that he was removed from the Crown public-house in Soho in consequence of its being taken by the Metropolitan Board of Works. He received compensation. After he went out the premises remained standing and occupied for two years.

Mr. G. T. Brain said he was formerly a tenant of the Beaufort Arms public-house, Beaufort-street, Chelsea. Subsequently the house was taken over by the Board, and witness received £5,000 as compensation. The house was, he believed, open still.

Mr. Frederick Gannaway, the present tenant of the Beaufort Arms, stated that he had occupied the premises since the last witness gave up possession. He had made various payments, under pressure, to Mr. Goddard, to whose nominee, one Stephens, he had also given £150.

Mr. C. J. Phipps, F.R.I.B.A., recalled, said that since the last meeting of the Commission it had been brought to his knowledge by some memoranda that in 1884 he made Mr. Fowler a present of some money. It was in relation to Hengler's Circus. He made an application to the Board in May, 1884, to rebuild Hengler's Circus, which had been closed in the same way as the Criterion Theatre. In June his client called on him and informed him that the Theatres Committee of the Board of Works objected to the site for rebuilding. It was proposed to make the new buildings fireproof. Witness called on Mr. Fowler and stated the circumstances to him, and asked him the best course to adopt. Mr. Fowler suggested that he should write to the clerk of the Board, asking that the matter should be referred back to the Theatres Committee for reconsideration. Lord Herschell: Of which Mr. Fowler was a member. It would go from the Board to the Building Act Committee, and then to the Theatres Sub-Committee?—Yes. The Theatres Committee report to the Building Act Committee, which reports to the Board. We were anxious to stop this getting into the newspapers. I wrote to the clerk of the Board on June 9, 1884, and on the 11th received a reply stating that the matter had been referred back to the Theatres Sub-Committee in order to afford an opportunity for a conference. A week later I had an interview with the committee, having had a model made in the meantime. The matter was argued out very fully in a full committee, and they arrived at the conclusion that if we blocked up all the windows of adjoining properties looking on the circus there would be no objection to the site as a site. That was the whole of the matter. The plans were passed on the 16th of July, 1884. On the 31st of July I called on Mr. Fowler and said, "You have been very kind to me in this matter, and I am very much obliged to you." I gave him £40. He did not ask for it. There was no condition made, and I gave it to him as a voluntary present.—Lord Herschell: Mr. Fowler was a member of the Theatres Sub-Committee?—Witness: Certainly. Then in reference to lots 2 and 3, Shaftesbury-avenue, it is within your lordship's knowledge that the £200 payment has been returned.—When?—In July of last year Mr. Fowler sent for me and said, "I find that Mr. Hobson's name is mixed up very considerably with Mr. Robertson's in the inquiry made by the Board. You are aware that I have a cheque from him of £200 which ought not to have been paid to me, and I want to hand it back." I said, "I will take it, but it cannot cancel the transaction. Of course, the cheque paid to you appears in Mr. Hobson's books. I will take it back and return it to Mr. Hobson." This I did. The £200 was returned 12 months ago.—You did not state this before?—No.—Lord Her-

schell: It had come to your knowledge that the information had been given to us?—Witness: Certainly. (Laughter.) The £200 was in respect of the Shaftesbury-avenue site, as had been stated before. Witness found that he had given £10 each to two clerks in the employ of the Metropolitan Board.

Mr. Thomas Verity, F.R.I.B.A., said he was employed as architect by the proprietor of the Criterion Theatre. In reply to Lord Herschell, he stated that the Criterion Theatre was pronounced unfit for use by the Board of Works, and Mr. Fowler and Mr. Alderman Saunders were called into council. Mr. Saunders did not really assist in the drawing of the plans, which were witness's entirely, but they were coloured in a certain way which Mr. Saunders thought might make them clearer to the Board.—Is that all that Mr. Saunders did in connection with them?—Yes. In 1883 Messrs. Spiers and Pond bought the site of the Cook Tavern in Fleet-street, and witness was instructed to prepare the plans. Mr. Haines, who was Messrs. Spiers and Pond's agent, suggested that Mr. Saunders should also be employed, because they felt under an obligation to that gentleman. Witness said that if he had a partner he must have 7½ per cent., not 5 per cent., and on April 14, when they settled up, he handed Mr. Saunders a cheque for £450. That, he understood, was for Mr. Saunders's services in connection with the Criterion.—Lord Herschell: Did he take a joint share of the work?—Witness: No, he did no work at all. In reply to Mr. Grenfell, witness said he was architect to the Lord Chamberlain's department. He always considered the Criterion the safest theatre in London.

Mr. John Alexander James Woodward, district surveyor for Central Lambeth and part of Battersea, stated that he was originally an assistant in the office of Mr. Saunders. He had received £200 in connection with the Pavilion business.—Did you meet Mr. Villiers in Robertson's office at the Board of Works?—Yes. A suggestion was made that I should see Mr. Saunders and ask him to give what consideration he could to the claims which Mr. Villiers considered that he had on the Board as an old tenant.—That was before he had got the site?—Yes. I saw Mr. Saunders. The question as to who was acting professionally for Mr. Villiers was raised.—By Mr. Saunders?—Yes.—What did you say?—I told him that Mr. Villiers had no architect. I had previously spoken to Mr. Villiers on that subject, seeing a little difficulty ahead.—What was the little difficulty?—I thought Mr. Saunders might expect to act.—And you could not be certain of securing his interest for Mr. Villiers unless he was going to be architect?—No, I would not say that.—What was the little difficulty?—I thought Mr. Saunders might have to act for Mr. Villiers, and I wanted to be in a position to say whether Mr. Villiers was committed to any professional man or not.—You found he was not?—Mr. Villiers assured me he was not. I asked Mr. Saunders whether it was a matter in which he could act, and he said "Yes."—Was this before Mr. Villiers had got the site?—Yes.—Did you say to Mr. Villiers in Mr. Robertson's office, "About this affair, Isaacs and Florence are posing themselves over London as your architects"?—I told Mr. Villiers that Mr. Saunders had stated that Messrs. Isaacs and Florence were declaring themselves to be the architects.—Did not Mr. Villiers say, "How can that be, as nothing is finally settled"?—I do not remember; but, as a matter of fact, he did not want an architect at all.—Did you go afterwards with Mr. Villiers to Mr. Saunders?—Not with Mr. Villiers. There was an appointment made. When I arrived Mr. Villiers was with Mr. Saunders.—You did not hear all that passed between them?—No.—Did you say, "They are not friends, and I do not think you will get any support from Mr. Saunders if Messrs. Isaacs and Florence are architects"?—No; I swear I did not.—You intimated to him, I suppose, that he had better have Mr. Saunders?—I do not think he required any intimation.—What do you think you got your £200 for?—Well, I think I got that for the introduction and persuading Mr. Saunders afterwards to adopt the elevation of Mr. Worley.—Did you give any portion of the £200 to anyone?—No. Witness further stated that he had acted for Mr. Saunders in compensation cases against the Board which he could not take himself

12 or 14 years ago.—What did you give Mr. Saunders—half, or what?—I think that was the arrangement—half.—Think, now?—It is some 14 years ago, and to the best of my recollection it was half.—With the exception of the £200, have you had any pecuniary transactions with Mr. Saunders since?—No other.—By Mr. Winch: I was quite competent to take the Pavilion work myself, but there was no likelihood that Mr. Villiers would give it to me.—Why not you instead of Mr. Saunders?—Lord Herschell: I think the reason is perfectly plain, Mr. Winch.—Have you paid anything to any other official of the Board?—Yes; £25 to Mr. Robertson. That was because a client had taken some ground at Peckham, and 18 months afterwards Mr. Robertson said I had made some money out of it, and had not given him a friendly consideration.—Had your client tendered for it?—Yes, direct to the Board.—Had Robertson given any advice as to what he could buy it for?—Lord Herschell: We know perfectly well now what Mr. Robertson's position was and what he did.

Mr. Statham Hobson, auctioneer, recalled, stated that in the summer of 1887 Mr. Phipps called on him with a message from Mr. Fowler and a cheque for £200. He said that Mr. Fowler wished to return the £200, as in the inquiry held by the Metropolitan Board of Works the witness's name was mixed up with Mr. Robertson's, and he did not wish it to be said he had received any money from him, and that he would rather lose the money than have the cheque. Witness knew perfectly well that Mr. Phipps and Mr. Fowler were working together because Mr. Fowler was a member of the Board. The last money he gave Mr. Robertson was on February 29, when he gave him £500 to close transactions between them.

Mr. Francis E. H. Fowler, F.R.I.B.A., till recently a member of the Board, was recalled and cautioned by Lord Herschell. Lord Herschell: When you were examined before you were asked particularly whether you had received any money in connection with advice as to theatres. Your attention was called specially to the question of exits, and you said that as far as you knew you had not given any such advice or received any fee?—Yes.—We are informed that you received £100 in connection with the proposed alterations of the Criterion Theatre?—That is not so. What I was concerned in was the ventilation at the rear of Messrs. Spiers and Pond's premises. At the time the theatre was closed I was interviewed by Mr. Haines, and also by the late Mr. Webster, the contractor for Messrs. Spiers and Pond, as to the exact reason why the Board had come to their decision. I explained that the theatre was closed because it was ventilated by artificial means. Mr. Webster asked me what could be done to remedy the defect, and I told him nothing less than reconstruction, unless Messrs. Spiers and Pond would consent to give up a large portion of the rear of their premises at the restaurant for the purpose of forming an area so that they could get direct ventilation down to the theatre. Upon that he asked me to go and see the premises with him. Nothing was said about payment. In answer to further questions, witness said he inspected the premises, made calculations, and suggested a scheme whereby they could get an external area right down to the theatre. The Board had nothing to do with the ventilation of theatres, and he would not have gone into the question of entrance and egress.—You did not receive the payment from Mr. Webster?—From Mr. Haines.—Did you know that Mr. Saunders was receiving payment?—I knew he was employed.—Did you know that Mr. Goddard was receiving payment?—I did not.—You were asked about receiving money in connection with advice given to persons applying to have plans passed. Did it never occur to you that the Criterion would come within the scope of that question?—No. I thought it clearly without the scope.—At the very time when the matter was before the sub-committee you received this £100?—Not at all; afterwards. At that time the reference was discharged and the whole thing was at an end.—Immediately after that Mr. Verity sent in new plans?—Two months afterwards, but as to the old ones on which we had legislated the reference was discharged.—We know now that it was paid to you as a bribe—it never occurred to you that it was equivocal?—I should think not.—It did not seem strange

that they should come to you as a member of this sub-committee to consult you about the closing of the theatre and how it should be reopened? Your position did not seem an equivocal one?—It did not.—Was there no other instance in which you received money?—Not to the best of my knowledge and belief. It is difficult to remember every action of mine for the last twenty years.—Will you swear there was no other instance?—I think I can swear that most conscientiously.—We have heard that there was a case in which you received £40?—Yes. Mr. Phipps gave me that as a voluntary gift.—How many more voluntary gifts have you had?—I do not remember Mr. Phipps giving it to me. He said so, and I believe he said what is true, but I do not recollect it.—There may have been a good many voluntary gifts you have forgotten, perhaps.—I do not think I should forget anything of that kind.—I hardly remember that I got that £40, although I believe Mr. Phipps is right.—Your memory is imperfect, perhaps. Did you give any advice in connection with the plans of the Camberwell estate?—It belonged to a client of mine, and I laid out the estate for him. I was only paid what I regarded as my professional fee—50 guineas.—Was Mr. Saunders called in in relation to the same estate?—I do not know.—You told us last time about the payment of £200 by Mr. Statham Hobson to you, but you did not tell us that you returned the money.—I did not.—What did you return it for if it was perfectly honestly obtained?—There was an inquiry at the Board and I found that it was stated that Mr. Robertson and Mr. Hobson were connected. It came through the hands of Mr. Hobson, and I said I would not have it, but would rather lose the money.—Where was there anything to be afraid of?—I was not afraid, but I did not like to have the money through Mr. Hobson's hands.—You sacrificed £200 and still thought it was a perfectly honest transaction?—So I do now.—It never even occurred to you that there was anything wrong in the transaction?—It did not.—Why did you not communicate it to the Board?—I had no ground for doing so. I had no evidence.—Why did you not seek to get evidence?—I did not suppose there was anything wrong.—By Mr. Bosanquet: The £100 was sent to witness. It was a professional fee. He gave no receipt for it, nor did he for the other payments of £200 and £40. No account was entered in his books; they were put down as fees.—In answer to Lord Herschell, the witness said he voted for the closing of the Criterion in the committee on the ground of want of ventilation.—Lord Herschell: Then the point on which you were consulted was one of the very points on which you had to determine?—Witness: The question of ventilation is excluded from the Act.—Yet you voted on that ground?—And other things.—Lord Herschell: I must warn you that in my opinion you have not been candid with the Commission.—Witness said he considered that the Board had nothing to do with the ventilation. He did not advise with respect to the theatre, but with respect to the area, so that when reconstructed there would be proper ventilation.—That is, advising as to reconstruction?—Partly.—Whether that would be sufficient would be a matter on which you would have voted as a member of the Theatres Sub-Committee?—Yes.

Mr. Robert Evans, surveyor and architect, said he prepared the plans for the Albany-road estate in Camberwell. The proprietor, Mr. E. Bird, consulted Mr. Fowler and Mr. Saunders, witness having been unable to get the plans passed by the Board. A line of frontage was added by Mr. Fowler and Mr. Saunders—a work of about ten minutes; and after Mr. Fowler and Mr. Saunders had been consulted the plans passed through. Witness had another estate at Brixton. He had complied with the provisions of the Building Act in every way, but the plans had not been passed, nor had he received any reason from the Board why they were not.

Mr. James Snelling, a member of the Brixton Vestry, said he formed one of a syndicate who were making a new road crossing Rush-common in Brixton. On one occasion he met Mr. Fowler, who asked witness to introduce him to the syndicate. Witness replied that an architect was already employed, Mr. Evans. Mr. Fowler remarked, "It would be advisable, because I could make things go so easy for you,

I could make a nice promenade in the front of you." The matter was discussed at the syndicate, and Mr. Fowler's services were declined, as the syndicate considered they had complied with all the rules and regulations, and could see no reason why the Metropolitan Board of Works should not pass their plans. Subsequently he met Mr. Fowler, and told him they could not entertain his wish, and that gentleman said, "I think you are foolish; I could have done you a lot of good." Subsequently, at a meeting of the Vestry presided over by Mr. Fowler, that gentleman was pressed as to the reason why the Metropolitan Board of Works had refused their plans. The excuse he made was that Rush-common had been cut through. This common had, however, been cut through by other people and building was going on. The explanation being considered unsatisfactory, witness informed the Vestry of Mr. Fowler's offer, and told them of the conversation already referred to.

At the fifteenth session of the Royal Commissioners, held on Tuesday, Mr. Charles Dunch, architect, recalled, said he had no monetary transactions with either Goddard, Robertson, or Villiers; he had many transactions with the Board for many years, and was astounded at the evidence given; he had paid no part of his fees away, had nothing to do with the demolition or rebuilding of the London Pavilion, either directly or indirectly.—Mr. Felix W. Spiers (Spiers and Pond) said he was chairman of the Criterion Theatre, which was opened in 1873. In May, 1877, notices were served upon witness by the Metropolitan Board of Works that the place was unfit for a theatre. Mr. Haines, witness's agent, had a free hand entirely in the matter, and had the power to spend what he liked. He paid, in 1883, 250 guineas, which probably went to Mr. Saunders and Mr. Fowler. Witness first had transactions in purchasing goods with members of the Board in 1883, when the theatre was in progress; but the amounts were unimportant. Mr. Saunders acted as joint architect in respect of the Cock Tavern, but he did nothing.—Mr. Winch, Q.C.: But he had the £450.—Witness: That was between him and Mr. Verity. We gave £1,300 to the three architects.—That was very "substantial gratitude," was it not, for what he had done?—I don't know that; it was a matter between him and Mr. Verity.—You thought that for the services Mr. Saunders had given you at the Board he ought to be joint architect of the building?—I do not know that. By Mr. Winch: A cheque was paid to Mr. Verity for £1,300 in connection with that matter, and Mr. Verity handed Mr. Saunders a cheque for £450. Lord Herschell: But you paid  $\frac{7}{8}$  per cent. instead of the ordinary 5 per cent.?—That is correct. Mr. Winch: May I put it that that was rewarding Mr. Saunders?—I do not know. You can put it that way if you like. Witness added that the original Cock Tavern, which was resold to the Bank of England, and the new site, were both purchases from the City Commissioners of Sewers, and Mr. Saunders was then a member of the City Corporation.

Mr. Joshua Ellis, manager to Messrs. Spiers and Pond, said after the Criterion plans were passed, £10 was paid in recognition of his politeness to Mr. Lancaster, a clerk in the employ of the Board of Works.

Mr. Charles Bowyer, proprietor of houses in Goldhawk-road, Hammersmith, deposed that he could not obtain permission from the Board of Works to bring out certain shops in that thoroughfare, whereas another landowner in the same district was granted permission similarly to extend his line of frontage. In the latter case Mr. Millwood, an officer of the Board, was employed to draw the plans. In reply to the president, witness said that his architect had called at the Board offices to inquire the reason, and they refused to answer any questions. Witness then called and saw Mr. Vulliamy, the superintending architect, and endeavoured to find out what the objections were, and what would be allowed. He was ultimately informed that the Board were not in the position to give the information asked for by him; but that Mr. Vulliamy was ready to receive any amended plans which might be submitted. Witness attended at the Board of Works, and was told that if he asked to see Mr. Blashill, he might, as a favour, assist him; that he could make no promise, but that if

asked as a favour, he might perhaps give witness a hint which would help him.

Mr. Meadows White, Q.C. (to witness): Did not Mr. Blashill give a long interview in reference to the plans, and hear both you and the district surveyor?—Yes.—The President: But that was entirely as to the line of the building.—Mr. Meadows White: But the Board have no jurisdiction; it lies with the superintending architect, and the Board can only give its consent to the bringing out of the building line.—The President: Yes, they alone can do that. In the first instance in this case no building line was fixed, and witness asked to be allowed to have other plans prepared, showing the building coming over the forecourt, and that was refused, and then witness asked why, and was told he could put in amended plans throwing some of the ground into the front, but could not hear any more about it. After the general line was fixed he was then told that his plans were rejected.—Lord Herschell: I think that is the general case.

Mr. Ernest Schneider, architect, said that Mr. Barclay, Hammersmith, employed Mr. Millwood to make plans of a contemplated projection, and was allowed to build forward in an advanced line of frontage. Witness applied on behalf of a client for similar permission and was refused.

Mr. Alfred Millwood, now employed in the Architect's department as assistant valuer, being recalled, said that on only two occasions had he made plans for persons who wished to bring forward the frontage of buildings, and these were one-story shops only. One of these occasions was eight or nine years ago, and the second was the case of Mr. Barclay's property in 1883. Mr. Barclay was a very old friend, and witness drew the plan out of office hours at that gentleman's request. He had not the slightest influence in obtaining approval of the plans, and had practically kept clear of these transactions since he had been transferred from the Estates to the Building Acts office. Witness never said a word in the office about doing these plans.—Was it understood that clerks in the office were at liberty to do work for people outside with reference to plans coming before the Board?—I think it was known. It was not an understood thing. Witness did not put his name to the plan for Mr. Barclay, as it was merely a small tracing.

Mr. William Bradley said he was employed in the Improvement and Compensation of Estates Department of the Board, having been appointed in April, 1878. He was entirely under Mr. Goddard. He prepared details for valuations, which were submitted to Mr. Goddard, and he would settle the amounts which the Board was to give for any property. He never had any transactions for anyone outside the Board. In two instances he received money from people connected with properties which had been purchased by the Board. In August, 1885, he bought with a Mr. Hards property in Europa-place, at Battersea, which was scheduled by the Board. They bought it under another name for between £400 and £500, and resold it to the Board for £700. Witness valued the property for the Board at £660. Witness received £124 as his share of profits from the transaction. In April, 1886, witness bought also with Mr. Hards, but in a different name, property in the Hughes Fields Scheme, Deptford, for between £1,400 and £1,500, and he re-valued it for the Board, two and a half years later, at £2,800. Mr. Goddard valued it at £3,000, and that sum was paid by the Board. Witness had £500 out of that transaction, and Mr. Hards took the rest, having financed it all. Witness was still assistant valuer to the Board, and had a salary of £350 a year. Witness had purchased ground rents at Greenwich, on land scheduled for the tunnel scheme, but had now no interest in the property, which he afterwards surveyed for the Board with Mr. Goddard.

Mr. Thomas Blashill, F.R.I.B.A., superintending architect to the Board, recalled, was examined by Lord Herschell as to the method of settling building lines adopted by the Board, with especial reference to the witness Bowyer's case. At its close, Lord Herschell remarked that, so far as he could discover, there was an enormous amount of trouble given to applicants, who appeared to be entirely at sea with regard to this matter. Plans were sent in and were rejected, and while people might have been told from the beginning that it was no good

sending in their plans, no information was given them.

Mr. Edgar Harper, assistant to Mr. Robertson in the Estates branch of the Board, said his duty was to register particulars of all property purchased by the Board. He never did any work for anyone outside the office, and on no occasion was he interested in any transactions affecting the Board's property.

Mr. Frederick John Lankester, one of the clerks of the Metropolitan Board, said he had received a £10 note from Mr. Haines, agent for the Criterion, months after the passing of the plans. He did not know what the payment was for, but accepted it.

Mr. Haines, recalled, said he had no recollection of the transaction referred to by the last witness. If he did make the payment, it must have been in connection with the Criterion.

Mr. Matthew Goddard was recalled, and handed in a long list of payments which had been made to him in addition to those of which he had already given evidence. Witness denied the statement of Mr. Garraway that the payments paid by that gentleman to himself had been extracted or extorted from him.

Mr. John Hebb, F.R.I.B.A., assistant architect, and chief of the Building Act branch of the Board, was recalled. In reply to the President, witness said he had frequently, between 1880 and 1885, made applications to theatres for boxes or stalls. He might have done this, perhaps, once a month. The applications were addressed on the Board's notepaper, and the persons by whom they were received would know that the department had the supervision of theatres. He recollected obtaining seats for two members of the Board, Mr. Fell and Mr. Furniss. He had never received any commission, fee, or other consideration, nor had he made any transactions with the Board's property.

The Commissioners again adjourned.

#### INSPECTION OF BRIDGES.

SOME time ago we alluded to the necessity there exists for an official inspection of railway bridges. Not a few of these structures were built sixty or seventy years ago, when iron construction was young and in its experimental stage, and when locomotives were considerably less in weight than they are now. Many collapses and falls of bridges have taken place during the last few years, but the same want of information and attention prevails respecting them. In America the question has been even more keenly discussed. Many sad records of railway-bridge catastrophes have been published—some of them heartrending and thrilling—in which fire has added to the horrors of a sudden precipitation of heavily freighted trains. Some time ago a circular was issued by the American Society of Civil Engineers, embodying suggestions about measures to insure an inspection of railway bridges. These suggestions were discussed at the annual convention in July last, and the remarks made by several engineers are of interest. In America the art of bridge construction is carried on by a number of contractors who know very little of the subject, but who undertake the business; many of the structures are put to uses for which they were never intended. Some useful suggestions are made by Mr. John A. Wilson, C.E. In reply to the question, What is proper bridge inspection? Mr. Wilson points out that a railway structure may be under constant surveillance. The engineer in charge could make an inspection once a year or oftener; he should keep a record of his observations and of the reports made to him by the foreman; the latter should make an inspection once a month or oftener, and report to the engineer; the road foreman should make a daily inspection and report any defects to the chief foreman, so each in turn would do his best to keep the structure in a safe condition. Plans of the structure with strain sheets and calculations of its safe load would be in the hands of the engineer. When the bridge is an old one it should be measured and calculated, and plans prepared to discover its capabilities, and to base operations. Now, the majority of the bridges that do duty come under the second class: they have original defects of design, material, and workmanship, and it is impossible to put them into a safe condition without a reconstruction or costly alterations. A perfect record of every

weakness in plates, riveting, flanges, proportion of latter to web, piers, and foundations is of the first importance; having this record the engineer or his assistants can periodically test any point to see if the weakness grows or not, and to enable the quickest remedy to be applied in case of need. We can imagine an official inspector inspecting a bridge yearly or monthly without perceiving the weak point; we can imagine him expending labour and money on the structure without really touching the real mischief, which may be hidden from view or not readily perceived by examination of the drawings. It should be observed whether each part of the structure is really doing its proper duty. Mr. Waddell suggests that every company in the States should have prepared and filed a report by a qualified expert upon the capacity of every bridge. The report should consist of a diagram, showing sections of all main members and stresses to which they are subjected by the standard maximum load; also sketches of all details, chord packing, riveting. He also proposes that the main dimensions of the structure and sections of all members should be recorded in a certain manner, so that any particular data may be found immediately by inspecting the notes; that the sizes of all parts in the neighbourhood of each panel point, and each connection of main members, the spacing and diameter of rivets, the packing, dimensions of eye bar heads, thickness of bearings, and other details be recorded systematically; also the details of main members; that all faults in manufacture or design, the effect of wear, such as loose rivets, bent pins, rust, cracked castings, and defective masonry should be examined. The floor system, ties, rails and guards are also to be examined, the effect upon the bridge of rapidly-passing trains, the deflections caused thereby. Most of the answers received also agree that a standard specified rolling load should be adopted, and a specified engine wheel base for rolling loads. There is little doubt that many of the failures of these structures have arisen from the actual loads exceeding the specified loads. The old bridges were designed for much less heavy engines than are now in use. Their margin of strength has been reduced also, by wear, oxidation, settlements of piers, and other causes. One of the replies proposes a number of standards for rolling loads, graded according to the train weight, and the present and probable future traffic. He observes that it would be waste of money to require every bridge to carry the heaviest traffic. Another suggestion is that a standard bridge floor be adopted, so constructed as to carry safely a derailed engine or train over it. Other suggestions of a detailed character are thrown out. The proper instruction and examination of bridges will necessitate a division of the labour. First we have old structures, whose dimensions are not on record, and for which drawings and details of minute character would have to be prepared, together with a careful record of defects; second, we have structures of recent construction whose dimensions are known, and the plans of which remain. There would be little difficulty with regard to the second class of structures, as the engineers who have designed them are probably still living, or the details are in existence; but with the old bridges a very minute examination would have to be made, especially the amount of wear, and rust, and other defects due to vibration or settlement.

#### LIGHTNING RODS.

SOME useful particulars are given in Professor Oliver J. Lodge's lectures on the "Protection of Buildings from Lightning," delivered at the Society of Arts. Referring to the tape and rod forms of conductors, it is pointed out that Faraday maintained that sectional area was the one thing necessary, and that shape was wholly indifferent; on the other hand, Sir W. Snow Harris considered that tube conductors were just as good as solid rods, and that flattened ribbon was better still. Faraday was thinking of nothing but conduction for steady currents, Harris was guided by experience. The lecturer thinks that Harris was right, and to prove this point he gives the results of experiments made upon two conductors of copper of the same weight, but one in the form of wire, the other in the form of a

ribbon, by which it is shown that the flattened form of conductor has the advantage over a mere round section for carrying off a charge, and with least liability to side flash. As to the deflagration of the conductor, Mr. Preece has found that ribbon and wire are equally easy to be destroyed by a flash. Experiments have also shown that straight conductors have a tendency to side flash, however thick they may be. No conductor, Prof. Lodge says, is able to prevent it altogether, unless it is zigzagged to and fro, in which case it is found to have practically no self-induction, and side spark is nearly stopped. It must also be remembered that a rod of iron carries off a discharge better than a rod of copper; the discharge probably penetrates iron deeper than it does copper; its inferior conductivity is considered even an advantage in rendering the flash slower and less dangerous. When galvanised, it can be made almost as durable as copper, and its liability to get magnetised is no objection. Prof. Lodge thinks the use of copper for lightning conductors is doomed. The lectures are full of interest for the architect. The liability of objects to be struck is shown to depend upon certain conditions—for example, whether the flash occurs from an already charged surface which has strained the air close to bursting point, or whether the flash is produced by a rush of electricity into a previously uncharged conductor too hastily for it to prepare any chosen path. These are considered, and the results of experiments given.

#### STRAINS.\*

By G. A. T. MIDDLETON.

#### LOADS ON SUPPORTS.

THE primary object of cantilevers, girders, bridges, and roofs is to convey loads from their point or points of application to the points of support. In doing this various stresses are set up in the different members of these structures; but before the amount of these can be ascertained with any degree of accuracy, it is necessary, as will soon become apparent, to determine the proportion of the loads borne by each support.

In the case of cantilevers, it is evident that, there being but one support, the whole weight must be borne by that support, whether the weight be fixed in one spot or divided into many smaller weights, or evenly distributed along the length of the cantilever.

The load itself, however, is, in the case of a cantilever, but a small proportion of what has to be borne by the support. Were not the weight  $W$  (see Fig. 1) counterbalanced by

Fig. 1.

another weight,  $Z$ , the cantilever would overturn about the fulcrum  $f$ . The weight  $Z$  necessary to prevent this can be readily ascertained, the cantilever now forming a lever of the first order by taking movements about  $f$ , remembering that  $Z$  may be considered to be applied at the centre of gravity of the surface pressed, or, in the example before us, at the centre of the wall. Thus, to produce equilibrium—

$$Z \times \frac{y}{2} = W \times l$$

$$\text{or—} \quad Z = \frac{2Wl}{y}$$

A rather greater counterbalancing weight than  $Z$ , as ascertained above, should in all cases be provided for the sake of stability; but where a cantilever is built into a wall, this need not all lie directly over the cantilever, as

all the bricks or stones which would be lifted in case of its overturning may be included in the load (see Fig. 2). This allowance varies

Fig. 2.

with the bond employed; but as a general rule all material which would be inclosed by an equilateral triangle having the centre of the cantilever for its apex (Fig. 2) may be safely considered as forming part of  $W$ , no additional allowance being made for the adhesion of the mortar.

When the load on the cantilever is distributed (Fig. 3), it may be considered to act at

Fig. 3.

its centre of gravity, and the distance of its application from  $f$  becomes  $\frac{l}{2}$ . Then—

$$Z \times \frac{y}{2} = W \times \frac{l}{2}$$

Or—

$$Z = \frac{4Wl}{y}$$

In either case, the weight  $Z$  can be made up in many ways, as the exigencies of each case demand, and the total weight borne by the support becomes  $W + Z$ .

When a fixed load is borne by a girder at the centre of its span, common-sense tells us that half is carried by each support; but the proof of this depends again upon the theory of the lever, and as the proof is the same when  $W$  rests at any other spot than the centre, such a case is shown in Fig. 4. The girder may be con-

Fig. 4.

sidered as a lever, working round the fulcrum  $f$  to produce the load  $A$  on the right abutment. By taking moments round  $f$  to produce equilibrium, we must have—

$$A \times l = W \times x$$

Or—

$$A = \frac{Wx}{l}$$

This can be shown to scale graphically, as in Fig. 5. Set up  $W$  to a scale of so many tons or pounds to the inch over the abutment  $A$ . Join the extremity  $b$  of this line to  $f$ . From  $e$  (a point vertically under the point of applica-

\* In this, as in most works on this subject,  $W$  is taken to represent a fixed load, or the total of a distributed load,  $w$  the load per unit of length (generally per foot), and  $l$  the length.

tion of  $W$ ) draw  $ec$  parallel to  $fb$ ;  $cb$  will then represent  $A$  to the same scale as that in which  $db$  represents  $W$ . The reason for this is that  $bdf$  and  $cde$  are similar triangles, and so the

Fig. 5.

sides  $bd$  and  $fd$  are cut proportionally by the parallels  $fb$  and  $ec$ . That is—

$$bc : fe :: bd : fd$$

Or, in other words—

$$bc : x :: W : l$$

Which is the same as saying—

$$bc \times l = W \times x$$

Or—

$$bc = \frac{Wx}{l}$$

Proving  $bc$  to be equal to  $A$ , as obtained by the previous reasoning.

Where there are several loads on a girder, each can be considered separately as above, and the totals on each abutment added together; or else all can be treated in one single diagram by a somewhat curious application of the polygon of forces.

Suppose a beam or girder resting on the supports  $A$  and  $B$  (Fig. 6) to carry loads of

Fig. 6.

5, 8, 3, and 4 tons respectively where shown, the beam in this case being delineated by a single line. Place arrows pointing downwards over each load, to denote the direction in which it acts, and arrows pointing upwards under the point at which the effect of the loads is transmitted to each abutment. Letter the spaces between these arrows in alphabetical order, commencing at the left-hand side, the space between the upward arrow under  $A$ , and the downward arrow over the load of 5 tons being lettered  $a$ ; that between the loads of 5 and 8 tons being lettered  $b$ , and so on.

As the load of 5 tons lying between the spaces  $a$  and  $b$  acts vertically downwards, set off at the side, to a scale of weights, as before described, a distance representing 5 tons on a line drawn vertically downwards from  $a$  to  $b$ . Proceed in the same manner, setting off a distance representing 8 tons vertically downwards from  $b$  to  $c$ , to signify the load of 8 tons acting vertically downwards between the spaces  $b$  and  $c$ , and so on, taking care to make the letters on sketch and diagram tally for ease of reference. By

this means all the loads on the girder can be set down to scale, and it is only then required to divide the whole vertical line *ae* into two parts, to denote the proportions carried by the two abutments.

Assume any point *f* outside the line *ae*, and join *af*, *bf*, *cf*, *df*, and *ef*. Drop vertical lines through the centres of each load (on the sketch), and also through the points A and B, where the loads are transmitted to the abutments. Assume any point in the line drawn thus through A, and from this point draw a line parallel to the line *fa* (on diagram) until it meets the vertical line through the load of 5 tons. Place another letter *f* on the opposite side of this new line from *a* to represent the space in the centre of a polygon, of which this line is one side, and it will be seen that there is a line between the spaces *f* and *a* upon the sketch parallel to the line *fa* on the diagram. From the termination of the line between the spaces *f* and *a* draw another between the spaces *f* and *b*, parallel to the line *fb* on the diagram, and terminating under the load of 8 tons, and proceed in this manner until the abutment B is reached. Join the extremities of these lines under the abutments A and B, inclosing *f* (by the line which is drawn double on sketch), and letter the space outside this and between the two upward arrows *g*. The polygon now formed could be taken to represent in outline a truss such as would be in equilibrium under the assumed loads; and, by drawing through the point *f* on diagram a line *fg* parallel to the double line between the spaces *f* and *a* until it cuts the vertical line *ae*, the proportion of the total load borne by each abutment can be measured off, that carried by A being equal to the weight as measured by the original scale of weights, represented by *ag*, and that carried by B being equal to the weight represented by *ge*.

The loads and the proportions borne by the abutments are now represented by the closed polygon *abcdega* on the diagram, the loads *eg* and *ga* on the abutments being supposed to act upwards, as indicated by the arrows on the sketch in the first instance. This upward action, or, more correctly speaking, passive resistance, of the supports is an important factor in many calculations, and is generally known as the *reaction of the supports*. It is exactly equal at each support to the proportion of the load borne by that support, but necessarily opposite to it in direction in order to cause equilibrium.

In Fig. 6, and in all other drawings throughout this work in which reciprocal diagrams are used, lines which have to be drawn parallel to one another upon sketch and diagram are similarly numbered.

This reaction of the supports is supposed to occur at the centre of that portion of the girder which rests on the support, and in all cases of calculation affecting beams or girders it is usual to consider the span as from centre to centre of bearings, this being the "effective span." In diagrams this is usually shown as in

Fig. 7.

Fig. 7, *l* being the "effective" span from centre to centre of bearings, and not the clear span, as would appear at first sight.

Half of a distributed load on a beam is evidently carried by each support, and when part of a beam bears a distributed load, while the remainder is unloaded, such distributed load must be treated as a fixed load having its points of action at its centre of gravity.

While upon this subject it may be well to note that the centre of gravity of a number of loads resting on a girder can be ascertained as shown by dotted lines in Fig. 6, by continuing the line between the spaces *f* and *a*, and that between the spaces *f* and *e*, until they meet, which they will do vertically over or under the centre of gravity of the loads.

(To be continued.)

#### STRATA FLORIDA ABBEY.

LAST year Mr. Stephen W. Williams, F.R.I.B.A., of Rhayader, commenced to excavate the site of the Cistercian Abbey of Strata Florida, in Cardiganshire, and he read a paper thereon at the Denbigh meeting of the Cambrian Archaeological Association. It was then determined to continue the excavations and store on the spot the mouldings and other details of the church now hidden, with a view to elucidate the style and period of the building, and preserve its remains, under the care of a local committee. A fund of upwards of £90 has been collected, and, though not sufficient to complete the work, the estimated cost of which is £150, the committee determined to begin the excavation, under the superintendence of Mr. Williams, who has undertaken to direct and superintend the work gratuitously. The works are now in progress, having been commenced on the 24th May last, and a staff of twenty-two men, under Mr. Telfer Smith, as clerk of works, is employed in clearing away the rubbish of three centuries of neglect. About half of the nave, and the north and south aisles have been cleared, together with the whole of the north transept and its three eastern chapels, about half of the presbytery, and the exterior of the north transept, the east end of the presbytery, and the east side of the south transept and chapter house, disclosing the freestone plinths and buttresses, showing that the entire building had fine-dressed freestone quoins throughout. The excavations have already brought to light a most valuable series of architectural details, much of the carved work resembling in its character that at Lincoln and St. David's Cathedrals. The nave arcades were of richly moulded pointed arches of Early Transitional work, alternately of different sections. Already three distinct sets of mouldings have been discovered. Fragments of carved capitals have been found, and portions of the moulded bases and shafts of the piers. In the north transept was found the great north door, with carved mouldings of lily pattern, the same as in the north doorway of St. David's Cathedral. The three eastern chapels of the north transept had clustered piers, with pointed arches of Early Transitional type, and were groined. The carved central boss has been found in each chapel, together with the bases of the altars, and pavements of incised and encaustic tiles in patterns. Some of the tiles have armorial bearings and designs. The tile pavements are of rich glazing and colouring. Fragments of plaster painted in fresco have been found, with fragments of stained-glass windows, and much of the stonework has been painted. Externally, on the eastern side of the south transept, have been found a series of monks' graves, some of which have their headstones *in situ*. They are of early date, with very curious interlaced rope-work patterns, of Celtic type, carved thereon. The graves are covered with rough local stone slabs. The presbytery was also groined like the chapels. The ruins of the great central tower still remain to be opened. All the moulded stonework and carvings are carefully removed as the work proceeds and stacked on the spot where found, and an immense mass of architectural details is being accumulated. It is hoped that further subscriptions may be obtained, so that the work may be completed. It is proposed, if sufficient funds are obtained, to cover in one of the chapels, so that some of the more delicate carved work and other objects of interest discovered may be secured from damage or loss. Eventually it is intended to hand over the ruins to a local committee, who will take charge of them. Subscriptions in aid of the excavation fund will be received by Mr. R. W. Banks, Ridgebourne, Kington, Herefordshire, the treasurer of the Cambrian Archaeological Association.

#### DECORATIVE MATERIALS FOR INTERIORS.

THE use of cheap decorative materials for the embellishment of restaurants, buffets, and even theatres has increased. If we enter any of these places we shall find the older materials have been in the main superseded. The floors are no longer of ordinary deal or oak, but of parquetry or ornamental wood blocks; the counters and fittings are of mahogany or

walnut, decorated in a very profuse manner; the walls are no longer of mere plaster or paper, but lined with fine parquet, or painted tiles, or faience, sometimes with Lincrusta Walton; and the ceiling, following suit, is enriched with panels of the latter material or with fibrous plaster, divided by ribs into various geometrical patterns. The walls and ceilings are especially attractive in their luxurious ornamentation and often splendour, and a good effect, too, is obtained by the use of some of the many recently introduced linings for walls and ceilings. Then as to the theatres. The enrichment of the proscenium, the fronts of dress-circle and galleries, and especially the ceiling of the auditorium, are composed of materials which have been of late years brought to a singular degree of perfection, we mean the *papier mâché* and *carton pierre* decorations, the first made out of brown paper moistened with water and glue, and pressed into metal moulds; the latter from cuttings of cardboard converted into a pulp, and cast in plaster moulds. The plasterer and modeller of the old school have been superseded by these ready-made productions of the decorative manufacturer, and when the designs are in good taste, there is very little difference to be observed between the work of the best modeller and the screwed up slabs of the manufactured decoration. The sharp curves and angles and delicate foliage are produced in *papier mâché* with remarkable precision, and for neatness and cleanness surpass the work of the plasterer. The heavier kinds of decoration for ceilings and walls are generally of *carton pierre*, a stone-like composition well known to our readers. The moulds are prepared in plaster, which can be taken to pieces in the usual way. These moulds are then filled up solid, or more generally only lined with the *carton pierre* in a state of pulp. When tolerably dry, the mould is removed, and the material is subjected to heat in a drying room until it is quite hard. Nearly all the ornamental ceilings of our modern buildings and the decorations of private residences of a superior class are of one or the other of these compositions. For ceiling and walls in which the same pattern is repeated, plaster is no doubt the cheapest; but where elaborately ribbed and panelled surfaces and relief ornament is intended, there is no doubt a considerable advantage in using *papier mâché* or fibrous plaster, cast in slabs that can be screwed up to the wood joists or wall battens. All dropping of plaster is avoided, and the work can be put up without injury to the joinery. Some years ago Messrs. Jackson, we believe, constructed a ceiling of this kind for the late Marquis of Westminster at Grosvenor House. It was for a large room, independent of the walls, the whole ceiling being fixed to a wooden core or cradle, which could be raised or lowered some feet by machinery, to suit the condition of the room for sound.

The architectural advantage of this mode of construction is that the ceiling can be made hollow, light, and sonorous; further, that the most intricate design or ribwork can be formed, admitting of a decorative effect by the use of colour. The use of fibrous plaster, or ordinary plaster cast thin, with canvas as a backing, is now very extensively used where lightness and speedy execution are required. We now see the most elaborately designed ceilings reproduced in this manner, which it would have been impossible to execute in the old-fashioned manner, in real plaster or in wooden ribs, at anything like the cost or expedition.

Lady Magheramorne, who was accompanied by Lord Magheramorne and Mr. Stephens, M.P., on Saturday laid the foundation-stone of the new parish church for Hornsey. The site closely adjoins the old fabric, which, though erected in 1830, has been found quite inadequate to the needs of the growing population of the district. The new church, which will have seating room for 1,260 persons, and is to be built from Mr. James Brooks's designs. Towards the cost of erection, estimated at £10,000, nearly £8,000 has been promised.

A fire broke out early on Monday morning at Imperial-road, Fulham, upon the premises of Messrs. Lucas and Aird, contractors. A large one-floored workshop, containing three locomotives and other machinery, became completely involved, and was destroyed, while other damage was caused. The origin of the outbreak has not been ascertained.

## OUR LITHOGRAPHIC ILLUSTRATIONS.

## CORTILE, PALAZZO VECCHIO, FLORENCE.

LAST week, when illustrating the Colleoni Monument at Venice, we referred to Verrocchio's exquisitely-modelled bronze boy and dolphin surmounting the fountain in the centre of the Cortile of the Palazzo Vecchio at Florence. Though small, the work is one of the most charming productions of Andrea's genius. To-day we give a view of this Florentine Court, including a representation of Verrocchio's figure, and illustrating Michelozzo Michelozzi's magnificent Cortile arcades, which were built from his design in 1454. After the death of Brunellesco, this master of the Italian Renaissance became the great palace builder of the age, and among other world-famed works of the first importance and merit associated with his reputation as an architect is Cosimo de Medici's Palace in Via Larga, now familiar to us as the Riccardi Palace, and which was commenced in 1430. The Cortile there somewhat resembles in general terms the richer example of his skill at the Palazzo Vecchio. After Michelozzi's banishment to Venice in 1433, on his return to Florence he was engaged to repair Arnolfo's buildings at the Palazzo della Signoria, then declared to be unsafe. He made, too, a shrine for the genius of Fra Angelico in the Convent of San Marco, which was begun from his plans in 1437. The magnificent Medici villa at Careggi soon after this was designed and built by Michelozzi, who next erected another Medicean villa at Fiesole for Giovanni, Cosimo's son, and the Tornabuoni Palace was another of his works. The Palazzo Vecchio is too familiar a landmark in Florence to need much description here, while historically it marks the transition from feudal to civic government, and is possessed of many of the peculiarities of the Mediaeval fortress. It stands on the east side of the Piazza del Gran Duca on a cramped site adjoining the "cursed ground," on which once stood the Uberti Palace belonging to the hated and exiled family of that name. Arnolfo di Cambio, its architect, who was a pupil of Niccola, was restricted by the command which forbade his building on that land, and thus the Palazzo Vecchio, in consequence, is irregular on plan. The bell turret, so much admired by the late Wm. Burges, remains one of the marvels of Tuscan tower construction, for it has no solid foundations, but rests its weight for the most part on the machicolations of the façade. The Palazzo thus described was erected in 1298, as the residence of the Gonfaloniere and Priori, or superior magistracy of the Republic. Walter de Brienne occupied it subsequently, and after that, in 1540, the masterpiece of the Piazza del Signori, as it was then called, became the

palace of Cosimo I., who in that year removed from the Riccardi Palace, where the Medici had hitherto lived as private citizens. Here he continued to reside till his removal to the Pitti Palace in 1550. Since then the Palazzo Vecchio has been occupied by government offices. The exquisite detail of Michelozzi's work in this fine cortile is admirably shown by our plate to-day, which is taken from a good photograph by Brogi. Michelozzi was a son of Bartolommeo di Gherardo di Borgognone, and was born in 1396 and died in 1479. He built the Library of the Black Benedictines at Venice, and altered the palace at Milan and the old citadel at Perugia.

## LIVERPOOL CATHEDRAL: DETAIL OF THE CHOIR.

THIS geometrical double-page plate given herewith to-day, from Mr. Emerson's competition drawing, illustrates in detail the refined simplicity and true 13th-century character of the style adopted in this design, which was selected for the first place in the late contest by the referee, Mr. Ewan Christian. In the Royal Academy this year is hung an interior perspective of Mr. Emerson's work, and an illustration of it was printed in the BUILDING NEWS for May 11th last, when we referred to other drawings of the same design published by us on January 15th, 22nd, 29th, Feb. 5th, 26th, and March 26th, 1886. Mr. Christian placed Messrs. Bodley and Garner's design second, and Mr. James Brooks's design third in the competition. Recently, unfortunately for Mr. Emerson, the cathedral scheme has for the present been abandoned. As a model of architectural draughtsmanship this drawing is well worthy of reproduction, to say nothing of the beauty of the design which it represents.

## CHURCH OF ST. JOHN THE DIVINE, GAINSBOROUGH.

ONE of the most notable drawings in this year's Royal Academy (No. 1,852) is that which we reproduce to-day in illustration of the new church and buildings at Gainsborough, from the designs of Messrs. Somers Clarke and J. T. Micklethwaite, the architects. It shows the south elevation with the boys' school and parsonage to the front, and a court-yard between them and the church. The gate-way under the tower leads to this quad, as will be seen by the plan which we published, together with a west elevation of the buildings, in the BUILDING NEWS for May 18th last, when a description of the work was given.

## GLASGOW UNIVERSITY TOWER AND SPIRE.

THE tower of the University buildings at Glasgow was designed and built by Sir G. G. Scott, but the spire was omitted. It was intended by him to be constructed of wood covered with slating and lead. Recently a legacy of £5,000 was left to the University for the completion of the steeple, and as it was feared that a wooden spire might be in danger from lightning, and would require repairs very difficult to execute at such a great height, I was asked to prepare a new design in stone. I took for a model some of the spires of open stone-work to be seen in Germany and elsewhere, adapting the details to suit the building. It has been admirably built by Mr. Thompson, of Peterborough, the contractor for the whole of the University buildings. The effect is certainly satisfactory, and the completion of the lofty tower has had the result of displaying the great merits of Gilbert Scott's fine design in a way which was impossible as long as this important feature was unfinished. A bell weighing 60cwt., with two quarter bells, has lately been placed in the tower. They were cast by Messrs. Taylor, of Loughborough, the clock being by Joyce, of Whitchurch.—J. OLDRID SCOTT.

The worshippers at the Church of St. John the Evangelist, Toft, are now the possessors of a new organ, built at a cost of £230 by Mr. C. Whiteley, of Chester (the builder of the organ in the cathedral of that city).

At Saturday's Horsham Petty Sessions, Mr. G. Mitchell was formally dismissed from his office of surveyor of highways for the Horsham rural district, and Mr. T. Skinner, who is the surveyor of the county, was appointed in his place at a salary of £60.

## ALDWINCKLE TRAVELLING STUDENT-SHIP DRAWINGS.

OLD OAK CHAIR, &C., WENLOCK.

MR. H. V. LANCHESTER has lent us his drawings for which this studentship was recently awarded him at the Architectural Association, and from these studies to-day we have reproduced an interesting example of early 17th century woodwork, sketched in geometric detail at Much Wenlock in Shropshire. The Guildhall there is a quaint timber-built structure, with a piazza. The council-chamber contains some remarkably good fittings carved in oak, and a rich mantelpiece, from which an arabesque panel is here represented. There are some other pieces of furniture of similar character in the room. Wenlock, though a small place, is a corporate borough, the charter dating from Edward the Fourth.

## "BUILDING NEWS" DESIGNING CLUB.

DESIGN FOR A SCHOOL OF ART.

LAST week we were prevented from giving our illustration of the design placed second in the school of art competition, and so to-day we print a reproduction of the drawing. "Boreas" is the motto of the author, and a full description of the design will be found in our review of all the plans submitted, given in the BUILDING NEWS last Friday.

## ROBERTS' IMPROVED RAIN-WATER SEPARATOR.

AN improvement has lately been introduced in Roberts' Rain-Water Separators, which enables them to work in many situations where there was not sufficient vertical space to introduce a horizontal separator of the older pattern. It will be seen by the illustration that the canter is now placed at right angles to the stream of water passing from the head. Instead of the water passing round the side of the canter, and being delivered below, it is now

carried through one of two diverging channels in the upper part of the canter—at first through the one that carries it to the waste pipe, and then through the other directing it to the storage tank. The stream is thus kept in an almost horizontal direction throughout its course. The diminution of the vertical space required will be obvious when we state that the vertical distance between the inlet and outlet pipes for pure water in an old No. 3 Separator was 2ft., while in the new No. 3 it is only 6in.

The negotiations between the Edinburgh and Leith Corporations and the Edinburgh and Leith Gas Company, with reference to the acquisition of the Edinburgh and Leith gas concern, have now been amicably completed. The gas shareholders are to get an annuity of 9½ per cent. and £11,000 in cash—the former being equal to £14,000 a year. The reporters, Messrs. Livesey, C.E., and Laas, C.A., express the opinion that this arrangement is fair and reasonable to both parties.

A carved oak altar table, the work of Mr. J. Forsyth, has recently been placed in St. James's Church, Paddington.

## WAYSIDE NOTES.

I THINK a few sentences in your leader of June 22nd might possibly be construed into a somewhat unfair attack on Bath stone generally. It is quite true that there is so-called Bath stone which begins to deteriorate as soon as it is in position; but cannot the same be said of any other building material where the architect will not use, and the client will not pay for, the genuine article? You know, I am sure, that the Bath stone supplied by the great Bath stone firms, now amalgamated into one association, is without a rival as a constructional material. Look at Messrs. Wallis and Co.'s premises in Holborn—one unbroken frontage of four hundred feet of solid Bath stone from ground line to roof, built now nearly twenty years, and as perfect as the day the stone left the quarry. Look, again, at the Grosvenor Hotel, Pimlico, built more than thirty years since, and all Bath stone above the ground line except the hard stone landings, with its delicate carving as sharp as the day the chisel was taken from it. The fact is, if Bath stone is properly selected for its work, it is unrivalled as a building material. In the past, when isolated owners of small quarries pushed their single produce unscrupulously, mistakes in selection have doubtless been made; but now architects can be sure of having what they specify, and equally sure that the material will stand the severest test of time and wear.

I am very glad to see that the Royal Gold Medal has been presented to an accomplished designer in the Neo-Grecian style, and I believe that the decision of the Institute Council will meet with the approval of the profession generally, although many would prefer to see the honour conferred on one of our own countrymen. Sending the medal to foreign parts, however, must considerably lighten the task of those who have, in effect, the awarding of it. In this case the honour was most deserved, judging by what one knows and hears of the merits of Baron von Hansen's compositions in a refined style of Modern Greek. It seems to me that the fact that the medal was presented in this quarter points to the conclusion that there is a considerable liking for refined Classic architecture amongst architects. I believe I am correct in saying that when the Gold Medal has been presented to a British or foreign architect, it has usually been to a man whose style is in accord with the fashion of the times. One cannot imagine the token being given, at the present date, to anyone whose peculiar talents are in the direction of producing correct Gothic façades on strict Mediæval lines.

It certainly does not redound to the credit of the recipients of the Institute prizes and medals that only three or four out of the whole number should have been present on the evening when the awards were made. Such conduct savours of ingratitude; and I am quite of the opinion which was then expressed, that with two notifications as to the time when the awards would be made, every prize-winner should have endeavoured to have been present. The Pugin Travelling Studentship and the Tite Prize seem to have been well competed for, if one may judge from the names of those who just missed the prizes. Mr. R. W. Paul will, I am sure, turn his present opportunity to good account, as holder of the Pugin Studentship. One always feels a special interest in this prize, as its object—or its original object, I take it, was to enable the holder to perfect himself in that artistic touch in drawing Mediæval detail which fascinates us all, and which Pugin himself possessed to such an extraordinary degree that he would produce marvels of draughtsmanship with the wretchedest stump of pencil imaginable. I do not see any notice as to the exhibition of the candidates' work, but presume the drawings are on view at Conduit-street.

What a dearth of competitions! The whole-sale-and-for-export competitor must be rather slack of work, as he has doubtless long since polished off any current competitions. No more Imp. Insts. seem to come along, which building, by the bye, seems to be progressing favourably. From a report of a recent meeting of the Organising Committee, held under the presi-

dency of the Prince of Wales, I gather that the foundations of the main buildings have been completed at a cost of £6,000; that a tender from Messrs. Mowlem and Burt, for the making of the new road to be known as the "Imperial Institute-road," has been accepted at the sum of £5,825; and that the same firm's tender of £142,800 has been accepted for the erection of the main building, exclusive of the central, eastern, and western towers. Despite the antagonism that the scheme excited in many quarters, it seems destined to be brought to a successful termination. The competition was certainly a success, except from the defeated competitors' point of view. Let us hope, however, these latter gentlemen gained some consolation from other Jubilee jobs. I have come to the conclusion, by the bye, that the profession could do with a Jubilee every year, though after the fifth twelvemonth or so there would not be much original Mediæval stonework remaining in this country.

The exposures at the Metropolitan Board of Works inquiry continue with unabated vigour. I have been trying to think of some possible extenuating circumstances for the Board, as one grows weary of heaping up condemnations. I do not, however, find it possible to excuse anything in connection with the matter. All one can say is that we can stir up mud in most pools if we agitate the waters. The mud, however, which Lord Herschell has stirred up is of an exceptionally revolting nature. What a nice little family party the M.B.W. officials made, to be sure! The magnitude and frequency of the cheques that changed hands, too, will make the public imagine that any trade or profession connected with buildings, their design, erection, selling, and letting must be the high road to a certain and rapid fortune! When Paterfamilias reads in his morning paper that Mr. — received £450 for acting as joint architect, but doing nothing, in connection with a new building, he will consider that he can safely place at least two of his sons in the noble and exalted profession of architecture. The rush of pupils for the next few months may therefore be expected to be quite abnormal. Premiums will go up 500 per cent. Architects' offices will be crammed; there will be a great demand for rolls of plans wherewith to play "nine-pins" in the drawing-office; assistants will commit suicide by shoals; and the well-premiated architects will go to Henley or Lord's *en masse*. Architecture pure and simple will go to the dogs. Clients and contractors calling at the offices will be told to go to something worse. And all this dreadful state of things will arise from the visions of large commissions and bonuses that will appear before Paterfamilias when he reads the reports of the Metropolitan Board of Works Commission of Inquiry!

Mr. Mark H. Judge writes to the *Standard* of last Wednesday, and asks for contributions towards the expenses of the Metropolitan Board of Works Inquiry Committee, which, since the appointment of the Royal Commission has been incurring expenses—hitherto, for the greater part borne by Mr. H. H. Marks,—by collecting and preparing the evidence laid before the Commission. As Mr. Judge says, the committee is clearly working in the interests of the rate-payers. Those desirous of aiding the work of the committee, may send cheques, crossed "Union Bank of London," to the treasurer, Mr. W. H. Fenton, 11, New Oxford-street, W.C.

I was very glad to see in your recent leader that you advocated the formation of new trade guilds. The first practical step would be to endeavour to elicit the opinions of workmen on the subject. I often wonder that such do not at times comment on questions of the hour in the columns of the "B.N." That they have many ideas we know; but it seems difficult in the extreme to get them to commit them to paper. Often and often have I hoped to see letters from artisans and craftsmen anent jerry-building. Every honest worker condemns the system, as I know from systematic inquiry whenever I get a suitable opportunity; but one would like to see it in writing. A large number of working men see the *BUILDING NEWS*, I am sure, and if they happen to peruse these columns this week, I trust they will give

a few moments' thoughts to the subject of the formation of earnest trade-guilds, having the object of attaining the greatest excellence in their work, knowing that it is impossible but that they must reap a rich reward in the shape of actual increased wages. You, Sir, would, I am sure, gladly print any communications such as I have mentioned.

Surely there must be men amongst us whose whole nature revolts at the levelling, crushing effect of trade-unionism, and who have a soul above the everlasting, unvarying monotony of working hours under such institutions? It is such persons who should break away from the fetters of a body which only has for its object the gaining of underserved hire for some, and the keeping of deserved remuneration from others. They should burst the bonds that bind them down to one unnatural level, and band themselves together with a far higher aim. They may feel confident that the mere formation of a society or company of carpenters, joiners, stonemasons, bricklayers, and other trades, with the object of doing earnest work, will assure their occupation from the first. They may not be "worshipful" companies, but they would be respected by architects and employers of labour. I do not look upon this project as being in the slightest degree Utopian. It seems to me eminently practical. All that is wanted is action on the part of those toilers who have recognised the great truth that no one can produce beautiful work who does not labour with actual enjoyment, interest, and enthusiasm. Much there is to arrange; but all problems of detail could be solved in time, providing that earnest men could be found to grapple with those difficulties which beset the first steps both of the smallest and of the greatest undertakings. GOTH.

## CHIPS.

An organ in the parish church of Llanymynech, built by Mr. J. Bellamy, of Denbigh, was opened on Friday last.

The secretary of the Local Government Board has forwarded an official note to the town clerk of Harrogate, sanctioning the loan of £29,500 for the purchasing, by the Corporation, of the Montpellier Gardens Estate; also the sum of £960 for the completion of the reservoirs; and £1,200 for the completion of the Valley grounds.

On Friday the new church of St. John was consecrated at Rogerstone, near Newport, Mon., by the Bishop of Llandaff. The church, the foundation-stone of which was laid in August of last year, has been built at a cost of over £2,000, from the designs of Mr. T. M. Lockwood, of Chester. The plan of the building is very simple—a nave with one aisle, a chancel, and a square-built tower on the south side, capped by a dwarf spire. The walls are of local stone in random courses, with dressed quoins. The porch is of timber, and the roofs are covered with tiles. The church was illustrated by two views in our issue of July 29, 1887.

On Saturday afternoon the daughter of the Mayor of South Shields set in motion a new clock which has been erected over the railway-station in that town. The clock has been manufactured by Messrs. W. Potts and Sons, of Leeds, and has two illuminated dials, 4ft. across, facing King-street and Mile End-road respectively. The clock-tower has been designed by Mr. W. Bell, of York, architect for the N.E.R. Company, and has been erected by Messrs. Wilson Brothers, of South Shields.

The new quarters to be built on Whittington Heath, Lichfield, have been commenced. They will accommodate thirty married soldiers, for whom at present there is no room in barracks. The site of the new quarters is at the corner of the heath, just beyond the grand stand. The building will have a frontage of 123 yards to the Barrack-road, and about 90 yards to the Tamworth-road, the total area being 10,304 square yards, or about 2½ acres. Mr. Wilson, jun., Manchester, is the architect.

The Archbishop's Palace, Maidstone, having been bought as a memorial of the Queen's Jubilee by the townspeople, is now being restored, and the grounds laid out under the superintendence of Mr. Hubert Bensted. A new gateway, giving admission to the grounds on the side bordering the river Medway, has been built from the same architect's design.

The first section of the new church of St. Barnabas, Tunbridge Wells, will be consecrated by the Archbishop of Canterbury in October. Messrs. Catts, of London, are the architects.

# ARCHITECTURAL ASSOCIATION EXCURSION, 1888.

**D**ERBYSHIRE has been chosen for the annual excursion of the Architectural Association this year, and the week from August 13th to 20th has been settled upon; but as yet no definite details respecting the exact places to be visited have been determined. These will be arranged at a meeting of the committee next week. Matlock will be the head-quarters of the party.

The "fat things" which will anyhow constitute the chief part of the programme are Haddon Hall, Dorothy Vernon's love-sick home, where some may think a week well spent; Hardwick Hall, Lord Hartington's princely seat, completed in 1599, and which the old verse,

"... Hardwick Hall,  
More glass than wall,"

correctly describes in general characters; Bolsover Castle, renovated by "Bess of Hardwick" and finished by her grandson, the first Duke of Newcastle, in 1617; Wingfield Manor, built in the reign of Henry VI.—one of the earliest and finest examples remaining of a quadrangular mansion; Tideswell, "the Cathedral City of the Peak," hidden beneath the sheltering banks of Crewhook Dale, with its grand church; Ashbourne, a quaint old market-town north-west of Derby, where Dr. Johnson, temporarily tired of "the old Cock" in Fleet-street, loved to stay with Dr. Taylor, who gladly gave the great lexicographer a sincere and frequent welcome—here, "down thy slope, romantic Ashbourne, glides the Derby Dilly, carrying *six insides*"; Ilam Hall, four miles distant, is a beautiful Elizabethan mansion where Congreve wrote his "Mourning Bride"; Wollaton Hall, John Thorpe's masterpiece in Nottinghamshire, finished by the Smithsons about 1640; and Chesterfield, with its "crooked steeple," and places of interest in the adjoining district. Many a wayside stone-built farm-house and nestling, ivy-grown manor or cottage may possibly be searched out during the trip among the Derbyshire hills, rich as they are with the associations of legend and romance. The president, Mr. Herbert D. Appleton, F.R.I.B.A., will conduct the party. Owing to the nature of the roads the carriage journeys will have on this occasion to be reduced in number, and the places situated at considerable distances from the head-quarters will be reached, of course, by rail. The number of the party is fixed at thirty-four as an outside limit.

## CHIPS.

The new sanatorium, Eastbourne, is being warmed and ventilated throughout by means of Shorland's patent Manchester grates and Manchester stoves, supplied by Mr. E. H. Shorland, of Manchester and London.

The memorial stone of new premises for a Liberal Club were laid at Whitefield, near Manchester, on Saturday. The building, which will cost about £1,200, is being erected from designs by Mr. Thorp, of Whitefield.

It is asserted that the Midland Railway Company contemplate constructing a railway between Norwich and Leicester, *via* Stamford and Bourn, at an estimated cost of about £550,000.

On Friday, Sir E. W. Blackett, Bart., of Matfen, laid the corner stone of a new church at Henshaw, near Bellingham. The church, which has been named All Hallows (Bishop Ridley Memorial), has been designed by Mr. Johnson, of the firm of Austin and Johnson, Newcastle-on-Tyne. The church is in the Early English style, and consists of a nave, chancel, and vestry, with a porch at the west end. The estimated cost is between £1,200 and £1,300.

New local board offices have just been completed at East Grinstead. The buildings consist of a board room 28ft. by 18ft., with office for surveyor, and waiting room, and adjoining is a residence for the surveyor. The walls are faced externally with red local bricks with Bath stone dressings, and the roofs are covered with Broseley tiles. The works have been carried out by Messrs. Charlwood Bros., of East Grinstead, at a total cost of £758, from the designs and under the superintendence of Mr. W. N. Martin, of Wimbledon.

A new Congregational church in Crescent-road, Beckenham, Kent, was opened last week. It seats 600 persons, and has cost £11,500, with the adjoining schoolroom. Mr. Beaumont was the architect, and Mr. Holloway the builder.

# Building Intelligence.

**BRINDLE, NEAR CHORLEY.**—The old parish church of Brindle was reopened on Sunday last, after restoration. Some time ago the galleries in this church were considered unsafe, and Mr. James Bertwistle, F.S.I., architect, of Blackburn, who was called in, found that the whole of the beams were decayed with dry-rot. It was immediately decided to close the galleries and entirely remove them. This has been done, and the whole interior of the church has been decorated. The exterior has been restored and pointed, and the old window on the ringers' floor in the tower, which was fast crumbling away, has been replaced by a new one. The whole of the work has been executed under the personal supervision of Mr. Bertwistle.

**CREDITON.**—The nave and aisles of the parish church of Holy Cross were reopened on Sunday week for divine service. The square box pews have been removed and replaced by good open oaken benches, with carved traceried ends of Perpendicular treatment, floors under seating are paved with solid oak block, laid in double herring-bone 2in. thick. The aisle is tiled with Godwin tiles. The masonry of the piers, which had been much ventilated, has been made good, the whole floor of nave lowered to its original level, and the bases of piers opened up. The tower bases were found to be late Norman. An oak lobby and outer doors placed in the south porch, and the old font refixed in the south aisle. Messrs. Hayward and Son, of Exeter, were the architects, the work being intrusted to Mr. W. Dart, contractor, Crediton; Mr. W. Berry carrying out the masonry.

**HUCKNALL TORKARD.**—This parish church, wherein lie the remains of Lord Byron, has been enlarged and restored at a cost of £1,500, from the designs and under the superintendence of Mr. Robert C. Clarke, architect, Nottingham. The enlargement took the form of N. and S. transepts, the chancel being taken down and rebuilt (stone for stone) one bay eastward; the nave roof was taken off and a clerestory built over the nave arches; the tower, which was in an unsatisfactory condition, has been carefully underpinned with cement concrete. The Byron slab has not been touched, and the memorials have been refixed in their original positions. The works have been executed by Messrs. Fish and Son, Nottingham, under the direction of Mr. William Harris, who acted as clerk of the works.

**THE IMPERIAL INSTITUTE.**—At a meeting of the organising committee of this institute, held on Monday, it was reported that the actual funds now available, exclusive of subscriptions from the Indian Empire and temporarily invested there, amounted to £310,000. The amount of the endowment fund is fixed by the new charter at £140,000. The foundations for the main buildings were reported as having been completed in May last at a cost of £6,000. On the recommendation of the building sub-committee, the tender of Messrs. Mowlem and Burt for the making of the new road to be known as the "Imperial Institute-road" was accepted at the sum of £5,825. The same firm's tender for the main buildings, exclusive of the central and eastern and western towers, was accepted from a list of 15 competing contractors, the amount of the tender being £142,800.

**LICHFIELD CATHEDRAL.**—In commencing the restoration of the south window of the Lady Chapel last week it was discovered that the mullions, apparently of stone, were nothing more than Portland cement, plastered round an iron core, which, by rusting, had so disintegrated the cement that on being touched it crumbled away. This was the case with all the mullions save the centre one, which was of inferior stone and not of the same nature as the rest of that part of the cathedral, whilst the mouldings were inferior in design. This incongruous work was probably executed at the end of the 18th century, when so much of the other bad work was done. The work of the restoration of the east end is progressing slowly, and three windows have been taken out and replaced, including the east window. New figures have been placed in two southern buttresses of the Lady Chapel, and the stone-

work on that side generally restored under the care of the dean. The dean has arranged for the niches in the restored buttresses to be occupied by figures of female saints from the Old and New Testaments. In the upper niches will be placed the Old Testament figures, and in the lower the New Testament figures. In the buttresses already restored at the south and south-east angle of the Lady Chapel the figures placed are those respectively of Rachel and Phoebe, and Miriam and Lydia; whilst in the buttress further eastward the figures of Deborah and Martha are about to be placed. In the buttress now undergoing restoration the figures are to be those of Rebecca and Elizabeth.

**TROON.**—The foundation-stone of the new U.P. Church at Troon was laid on Saturday. The new church is situated in St. Meddan-street, the principal front facing the south, and the east elevation extending along Church-street. The buildings are designed in the Decorated Gothic style. The church will have a tower and broach spire rising to a height of 120ft. above the ground. At the north end the choir and organ-chamber is carried out in chancel form, and the hall, with a semi-octagonal front, forms a feature in the grouping. Internally, the church is divided into a nave and side aisles. The ceiling is semi-octagonal in form, with arched main couples. There will be galleries over side aisles and also at the end, and the pulpit is placed under a moulded arch at the north end, the organ-loft and choir being placed in the chancel behind. Sittings are provided for 660 persons, and besides a vestry and ladies' room, there is also a hall for 120 persons. The buildings are being erected from the designs of Mr. John B. Wilson, A.R.I.B.A., Glasgow, whose design was selected in competition. The contractors are—Mason, Orr, McLean, and Co.; Wright, James Ralley; plumber and gasfitter, D. Walker; plasterer, A. McSkimming and Son; all of Troon; slater, W. Darrie, Glasgow. The total cost will be about \$3,000.

**THEOBALD'S PARK, CHESHUNT.**—The extensive additions and alterations at Sir Henry Meux's, Bart., place at Theobald's Park are approaching completion, and the scaffolding is being now all cleared away from the new parts. The additions have been carried out from the designs of Mr. Charles E. Ponting, of Lockes-ridge, Marlborough, architect to Sir Henry's various estates. The whole of the new work is in style Queen Anne; it is executed in brick-work, and for the dressings brown bed Portland stone is employed. The new tower is carried up to some considerable altitude, and is surmounted by a cupola, whose ogee outlined high-pitched roof is covered with lead, and crowned by a wrought-iron vane of hammered metal. The lantern-like cupola has its side panels all around prepared for enrichment with scraffits, swags, grotesque figures, &c., in stucco work, and this will be done by Mr. Harry Hems, of Exeter, who is also carrying out all the sculptured work in stone and brick throughout the new wings. A feature on the upper part of the tower is a series of panels forming a frieze 3ft. deep around the entire girt. These panels are of red brick richly carved, the motif being the work at Hampton Court Palace. All the exterior woodwork is painted white, and the roofs are covered with blue slates. Mr. Elliott, of Newbury, is the contractor for the works, Mr. Western being his representative on the spot, and Mr. Johnson is the clerk of works. The task of re-erecting old Temple Bar as one of the gateway entrances to Theobald's goes on apace, and this work will probably be finished in about a month. The contractor has found much of the original stone missing, and if Sir Henry Meux had not rescued it when he did it would probably, bit by bit, have all gone piecemeal away ere many years more had passed.

A Jubilee drinking-fountain and monument on Stock's Hill, Ketterton, Butlandshire, was inaugurated on the 21st ult. The engineering was carried out by Mr. Molesworth, the excavating superintended by Mr. E. Nutt, and the erection of the monument was the work of Mr. Geo. Hibbins. The monument, which is of Ketton stone on a base of York slabs, stands 13ft. high. The octagon base is 7ft. 2in., and the shaft is 3ft. square, finished at the top with a ball terminal.

## Engineering Notes.

**ASSOCIATION OF MUNICIPAL SURVEYORS.**—The annual meeting will be held in London on Thursday, Friday, and Saturday, in next week, the Institute of Civil Engineers, 25, Great George-street, Westminster. On the first day, Thursday, the general meeting will be held at noon, when the annual report will be read and the President's address delivered. At 2.30 p.m., papers will be read on "Back Streets, Lanes, and Alleys," by Mr. H. U. McKie, of Carlisle; "Average Meter System," by Mr. G. R. Archamb, Chelsea; and "Ten Years' Experience of the Shone System," by Lieut.-Col. James, V.C., Wrexham. The drainage works at the Houses of Parliament will be visited afterwards. On Friday morning Messrs. Jennings' works at Stangate Wharf, Lambeth, will be visited, and the meetings will be resumed at 1.30 at the Institution of Civil Engineers, when the papers to be read are: "Electric Fire Alarms," by Mr. T. De C. Meade, Hornsey; "Water Supply," by Mr. W. Santo Crimp, Wimbledon; and "The Purification of Sewage by Electricity," by Mr. W. Webster, F.C.S. In the afternoon visits will be paid to the Lucigen Light Works (Page-street, Westminster), and John's Oxygen Works, Westminster, and the new Battersea Bridge Works. On Saturday members will embark on board a steamer kindly provided by the President, Mr. E. B. Alice-Clark, at the Temple Pier, and proceed down the river, inspecting the Tower Bridge, the Greenwich Ferry, where Mr. J. Standfield, M.I.C.E., will explain the works; and the new Outfall Works at Barking, where Sir Joseph Bazalgette, C.B., will receive the members and explain the works.

**MANCHESTER SHIP CANAL.**—A Select Committee of the House of Commons has passed the preamble of the Bill recently introduced by the Manchester Ship Canal Company. By this Bill the Company are empowered to make an important deviation of their authorised canal from Barton-upon-Irwell to its termination in Manchester, the effect of which will be to increase the water space by 14 acres, the quay space by 69 acres, and the quay frontage by nearly 2 miles, while the actual saving in expenditure will amount to £12,588.

**RIVER WITHAM DRAINAGE: OPENING OF THE NEW OUTLET AT HOBHOLE SLUICE.**—The new outlet constructed for the General Commissioners for Drainage by the River Witham for the more effectual drainage of the Fourth District has just been formally opened. On the completion of the new outfall channel to Clayhole, which not only dried the sills of the Hobhole sluice but effected a depression of 5ft. 6in. in the low-water level at Hobhole, it became evident that for the Fourth District of the Witham Drainage, enlarged and lower outlet would be absolutely necessary. The General Commissioners promoted a Bill in Parliament and obtained the necessary powers in 1887. With the addition of the new outlet just opened the sluice has now four openings each 15ft. wide, but the sill of the new opening is 3ft. lower than the old sills. This additional outlet will materially improve the natural drainage of the Wildmore, West, and East Fens. The foundations of the new works were carried down to a bed of hard clay 10ft. below the level of the old sills. The floor is 130ft. in length, formed of Portland cement concrete, and the sill quoins and copings are Derbyshire stone. The side walls are brickwork and concrete combined, with blue Staffordshire facing, and their maximum height from foundation to cope is 33ft. The central portion of the chamber carries the sea-bank, and is constructed in tunnel section 15ft. in height for a length of 68ft. The doors are constructed of English oak, with wrought-iron straps and bolts, and the land door is raised and lowered by a crab with double racks and pinions. The works throughout have been carried out from the designs and under the superintendence of Mr. J. E. Williams, M.I.C.E., by Mr. Samuel Sherwin, contractor, of Boston, who was represented on the works by Mr. Thomas Barwell.

**THE FORTH BRIDGE.**—Major-General Hutchinson and Major Marindin, of the Board of Trade, in their quarterly report, published on Saturday, of their inspection of the works

in progress for the construction of the Forth Bridge, say that the progress made during the quarter was most marked. The amount of additional steelwork which has been riveted is largely in excess of that recorded in any previous quarter. The character of the work is, to all appearance, of the same high class as heretofore, all the appliances for carrying it on have been thoroughly tested, and a regular mode of procedure, with which the workmen are every day becoming more and more familiar, has been finally adopted.

### COMPETITIONS.

**AINTREE.**—Mr. W. P. Hartley, who recently received 85 competitive designs for laying out his proposed model village at Aintree, has examined them, with the aid as assessor of Mr. J. F. Doyle, architect, Liverpool, and has selected the three prize designs. As the first two were equal in merit, though differing in excellence, each will receive an award of 50 guineas, the value of the first prize. The design chosen was that sent in by Messrs. W. Sugden and Son, Leek, and the one equal in merit came from Mr. Frank Mee, King-street, Manchester. The third prize (20 guineas) was awarded to Mr. W. E. Willink and Mr. P. C. Thicknesse, Lord-street, Liverpool.

**EDINBURGH.**—The town council of Edinburgh recently resolved to erect a memorial statue to the late Dr. William Chambers. Designs were invited from sixteen sculptors resident in Edinburgh and Glasgow, but only six have responded, and their models are on view this week at the Royal Scottish Academy Galleries at the Mound. The town council have asked Mr. T. Brock, A.R.A., London, to act as their artistic assessor. The schedule sent out to artists specified that the memorial is to consist of a statue not less than 10ft. 6in. high, on a pedestal not less than 15ft. high, and is to be placed in the centre of Chambers-street, opposite the principal entrance to the Museum of Science and Art. The statue is to be of statuary bronze, consisting of nine parts of pure copper to one of pure tin; not less in thickness than 3in. at any part, and thicker where the parts have to sustain weight. The pedestal is to be of best Aberdeen or Peterhead granite. The models are expected to be one-fourth of the full size, and to each model there will be a distinctive motto. The author of the design judged first in the order of merit will be employed to carry the work into execution; and premiums of £50 and £25 are to be awarded to the authors of the designs judged second and third in merit respectively. The whole cost, including statue, pedestal, and foundation complete, is not to exceed £1,250.

**GLOUCESTER.**—The town council met on Tuesday in committee of the whole house in reference to the baths question, for which it will be recollected they recently awarded the first premium to Mr. J. F. Trew, of that city. Mr. Trew was appointed architect, and it was stipulated that £6,000 was not to be exceeded. But the architect was required to make certain modifications in his proposals, and when the tenders were sent in it was found that the lowest was some £2,000 or more in excess of the stipulated £6,000. The Baths Committee then revised the specification, and amended tenders were sent in, the lowest being £7,500. This the committee recommended for acceptance; but this was opposed, and the matter was referred to the whole council in committee. On Tuesday, after two hours' discussion, there was an equal division as to the acceptance of the tender and as to the enlargement of the committee, and as the mayor declined to give a casting vote, the whole matter has been again referred to the council.

It is reported in the Lynn papers that the foundations of St. Mary's (R.C.) Church, on the London-road in that town, have given way, and that the building will have, it is supposed, to be entirely taken down. It is constructed of brick in the Geometrical Decorated style, and was erected in 1845 from a design by the late Mr. A. W. Pugin, at a cost of about £2,000.

Lord Hartington will preside at the annual meeting of the National Association for the Promotion of Technical Education, which is to be held at the rooms of the Society of Arts to-morrow (Saturday).

### TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

### TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.). To India (via Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

### ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

### SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

### NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLII., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., LI., LII., and LIII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—A. S. and S.—T. C. D.—E. A. and Son.—A. C. and Co.—M. H. L. B.—C. S. and P.—R. D. Co.

M. A. (There are two societies for clerks of works, on buildings and estates respectively. The one is the Clerks of Works Association, Mr. F. Dashwood, 38, Grosvenor Park-road, Walthamstow, secretary; the other the Society of Estate Clerks of Works, Mr. Thomas Potter, Assoc. S.A., Alresford, Hants, secretary.)—STUDENT. (Better apply to the secretary, at 9, Conduit-street. You may possibly get the information there.)

### "BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"H.M.S. Conway" "Bee," "Twig" "Launcelot," "Mayfly" "Old Gold," "Lawton," "Ghost," "Scottish Renaissance," "Uncouth Swain."

CHUZZLEWIT. (Your design for a school of art, which was lost in the post, has now reached us without the address label, and no name on the back as required by our rules. The plan would have ranked among those placed third. It is overweighted by too large a hall, and by a badly-lighted antique room, with only one end window. The elevation is very poor, and is not well drawn. Send your name and address.)—J. MARTIN SMITH. (The second design for the school of art is given to-day. See review last week.)—WILLIAM YOUNG. (Yes, the gardener's cottage is the last subject for the present series.)

## Correspondence.

### THE ST. GEORGE'S VESTRY BATHS AND WASHHOUSES COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—Will you kindly find room for the enclosed correspondence in your journal?—I am, &c., JAMES WEIR.

9, Victoria Chambers, Westminster, S.W.,  
July 3.

[COPY.]

9, Victoria Chambers, Westminster, June 5, 1888.  
To the Vestry of St. George, Hanover-square,  
re New Baths and Washhouses.

GENTLEMEN,—I have been requested by some of the architects who were invited to compete for the above to express their feeling of dissatisfaction with regard to your decision in the above competition.

The competitors were assured in the instructions from the Commissioners that an architect of established reputation should act as assessor, and as in the cases of the

Admiralty and War Office, the Law Courts, the Glasgow Town Hall, the Manchester Town Hall, and all public competitors, this was understood to imply that the assessor's decision was to be final and binding, unless some just cause could be assigned for acting to the contrary.

The competitors are surprised to find from the Commissioners' report that they have rejected the design which the assessor selected, and, moreover, have declined to produce his report.

And further, that the design selected by the Commissioners, according to their own statement, is defective, and will require "to be considerably elaborated and a few modifications" made in it.

They are also surprised that, as the selected design cannot be carried out for the amount stipulated in the instructions—viz., £30,000—that this fact of itself did not disqualify it.

As the competition has entailed a large expenditure of time and labour on the competitors, they respectfully request that you will, in justice to them, reconsider your decision and act on the assessor's award, and also publish his report.—I have the honour to be, Gentlemen, yours obediently,

JAMES WEIR, F.R.I.B.A.

[COPY.]

St. George, Hanover-square (Commissioners for Public Baths and Washhouses).

1, Piccadilly-road, S.W., 29th June, 1888.

SIR,—Your letter, dated 5th inst., addressed to the Vestry was read to the Commissioners at their meeting yesterday, and I was instructed to inform you that the Commissioners see no reason to take any further action in the matter.—I am, Sir, your obedient servant,

(Signed) F. W. DOGGETT, Clerk.

James Weir, Esq., 9, Victoria-chambers, Westminster, S.W.

### OUTLINE SPECIFICATIONS.

SIR,—Many architects, especially those connected with boards or companies, have from time to time drawn up outline specifications and had them printed for their own use. I have examined several such specifications, and found them far from perfect; but the advantages of the practice are so obvious that I would suggest an interchange of ideas on the subject in your columns, with a view to the compilation and publication of a general outline specification, containing all the common clauses of each trade, and enumerating the variable matter in its proper order. In this way the peculiarities of individual opinions might be eliminated, and the foundation of a canon of common construction laid, freed from the absurd tautology of obsolete practice, and recognised and available by all the profession.—I am, &c.,

J. HOWARD PENTLAND, B.A., B.E.

### CHIPS.

The London correspondent of the *Liverpool Mercury* asserts that Mr. Whistler is about to marry the widow of the late E. W. Godwin, and adds, "Mrs. Godwin, who was, for only a few years, the wife of the most serious conversationalist of his day, now becomes the mate of the conversationalist whose witty faculty never leaves him time for serious talk."

A parish hall was opened at Llanelly on June 26. Mr. Buckley Wilson, F.R.I.B.A., architect, Swansea, designed the building, comprising a hall 72ft. by 35ft., which is entered by a narthex the whole width of the building, and 7ft. wide. There is also a committee room 13ft. by 25ft. 6in., and a tea room.

Sunday schools are about to be added to the Wesleyan Chapel in Dagnall-street, St. Alban's, from plans by Mr. James Weir, of Westminster.

One of the longest tunnels in the world is that at Schemnitz, Hungary. It has a length of 10·27 miles—1 mile longer than the St. Gothard, and 2½ miles more than the Mont Cenis Tunnel. When the contract was made, in 1872, the work was let at about £7 sterling a yard, but for some years before its completion the cost was about £22 a yard.

Foundations of a Roman building have just been discovered in the rectory garden at Ebchester. The debris turned up include Romano-British pottery, a millstone, and animals' bones.

The ceremony of laying the foundation-stones of the new Wesleyan Sunday schools and morning chapel in the rear of the Wesley Chapel, St. Helen's, took place on Friday. The new buildings will consist of a morning chapel, eight classrooms on the ground floor, eight classrooms on the first floor, with infants' room, heating cellar, and kitchen. Messrs. Isitt and Verity, of Wigan and Bradford, are the architects, and Mr. William Harrison, Cotham-street, St. Helen's, the builder, and the cost of building and furnishing will be about £3,000.

The London and North-Western Railway Company contemplate erecting extensive docks on the river Dee, and surveyors have been engaged examining the river for that purpose.

## Intercommunication.

### QUESTIONS.

[9678].—**Damage by Vibration of Steam Roller.**—A Corporation having a 16-ton steam road-roller has had notice of an action for damage alleged to have been caused by vibration of a house owing to the roller passing and causing a mirror to fall, which displaced and broke several chimney ornaments. The damage is assessed at £20. Would any reader say if they have knowledge of any similar action, and, if so, would they kindly give particulars of same?—LANCASHIRE.

[9679].—**Copies of Plans—Conditions of Contract.**—Would some one of your readers kindly inform me how the following works? Conditions of builder's contract, as approved by the R.I.B.A. and London Builders' Society. Art. 4.—Complete copies of the drawings and specification, signed by the architect, are to be furnished by him or by the measuring surveyor to the contractors for their own use, and the same or copies thereof are to be kept on the buildings in charge of a competent foreman, who is to be constantly kept on the ground by the contractors. . . . Schedule of rules for practice and charges of architects, R.I.B.A.—"The following are the professional services included in the ordinary charge of 5 per cent.:- . . . preliminary sketches. Detailed drawings . . . One set of tracings and duplicate specification . . ." As it is necessary that the architect should have the original plans and specification, and that the clerk of works should have duplicates, how is the architect remunerated for the third set of copies which the R.I.B.A. and the Builders' Society say should be provided by the architect to the builder?—X.

[9680].—**Stone-Breaking Machine.**—Will any of your readers please say which is the best stone-breaking machine in the market?—A ROADMAN.

[9681].—**Diameter of Columns.**—A large shed of 90ft. span is proposed to be roofed by an iron roof in two spans of 45ft. each. The trusses are to rest on two external walls, and be supported in the middle on iron columns. What should be the diameter of these columns, if hollow and 50ft. high, and what is the best method by which the trusses can meet on top of the centre columns, allowing for expansion and contraction? What should be the thickness of the outer walls?—ROOFING.

### REPLIES.

[9676].—**Dry Rot or What?**—Undoubtedly dry rot. Nothing less than clearing out the parts affected, and far beyond, so as to leave no doubt that every particle of the rot is eradicated, and giving complete ventilation, will be of any use. A weak solution of vitriolic acid as a wash is recommended by G. Wilt, and I have used it with good results—i.e., washed over the parts not already infected and so preventing the spread of the disease. Heat, with moisture, and imperfect ventilation will rapidly develop dry rot.—WILLIAM A. GOSS.

On Friday afternoon the Rev. Dr. Jowett opened a new gymnasium which has been erected at the Leamington High School for Girls, the Parade. The gymnasium, which was designed and built by Mr. Fell, is a lofty room, 60ft. by 30ft. It is constructed of iron, lined inside with match-boarding. As the new building will be used not only as a gymnasium, but also as an assembly room, a platform has been constructed at the eastern end. The gymnastic fittings were selected and put up under the direction of Mr. Hubbard, director of the Birmingham Gymnasium. Hot-water pipes have been put into the room.

The clock tower erected at the junction of Queen's-road, West-street, Western-road, and North-street, Brighton, at the charge of Mr. James Willing as a jubilee memorial, was formally unveiled on Friday, and handed over to the municipal authorities. It has been built, from designs by Mr. John Johnson, selected in competition, by Messrs. Campbell. The materials are Portland stone and Peterhead red granite for columns, the latter being supplied by Messrs. J. Whitehead and Sons, of the Granite Works, Aberdeen. The clock dials, four in number, are 5ft. in diameter, and the face of the clock is illuminated at night by electric light. A time ball and vane surmount the spire.

On Sunday week the Webberley memorial window in St. James's Church, Longton, Staffs, was unveiled and dedicated. The window consists of two large lights, and the subject selected is "The Angel announcing the Resurrection of our Blessed Lord to the Holy Women." The angel in the left light is shown seated on the tomb within the sepulchre, and with uplifted arm announces the tidings to the three holy women occupying the other compartment. Behind the angel in the distance is seen the Hill of Calvary, with the crosses, emphasised by the rising sun beyond. The picture is framed with an architectural canopy and base elaborate in detail, these being mostly white and gold. In the large piece of tracery is depicted an angel holding a scroll. The window was designed and executed by Messrs. Heaton, Butler, and Bayne, 14, Garrick-street, London, who have also two other windows of a similar kind in hand for this church.

There is now on view at the Bethnal-green Museum a collection of Dresden china, silver plate, furniture, and other art objects lent by the Hon. W. F. B. and Mrs. Massey Mainwaring.

### LEGAL INTELLIGENCE.

IN RE WILLIAM DOUGLAS.—The bankrupt, who had traded at South Kensington and Chelsea as a builder and contractor, applied to Mr. Registrar Brougham, on Friday, for an order of discharge. The receiving order was made on November 26 last, the liabilities expected to rank being returned in the statement of affairs at £78,774, and the trustees stated that a dividend of from 6d. to 1s. in the pound might possibly be declared from the assets. The bankrupt began business in 1841, in Lowndes-street, with between £100 and £200 capital, and he subsequently engaged in large building operations, chiefly in South Kensington. He ascribed his failure to inability to realise his house property, and to the continuous depreciation of the value of it, and to heavy payments for interest on mortgages. The Official Receiver reported that although the bankrupt had kept such books as were usual and proper in his business, they did not sufficiently disclose his business transactions and financial position; and that he had continued his trade after knowing himself to be insolvent. The trustees opposed on the further ground that he had contributed to his failure by unjustifiable extravagance in living. Mr. Registrar Brougham said that with reference to the charge of imperfect book-keeping, the bankrupt had not kept such books as sufficiently disclosed his business transactions and financial position. He thought, however, that while the charge of unjustifiable extravagance in living was not established, the bankrupt had continued to trade after knowing himself to be insolvent. He suspended the order of discharge for 18 months.

A BUILDER COMMITTED FOR FORGERY.—At Southwark Police-court, on Tuesday, Arthur Goddard, 46, builder, 9, Swerdale-buildings, Sydenham, was charged on remand with forging and uttering various leases of houses in Sydenham and elsewhere, whereby he defrauded William Mercer and others, to whom he had mortgaged the same. It was stated that the indictment would include forgeries, involving payments of about £12,000 to the prisoner on the forged securities. The prisoner pleaded "Guilty," and Mr. Slade committed him for trial at the Old Bailey.

### CHIPS.

The plans of the new church to be erected at St. Anne's-on-the-Sea, prepared by Messrs. Pugin and Pugin, of Westminster, have been accepted, and the work of building will be commenced shortly. The new edifice will cost between £8,000 and £10,000.

A presbytery is shortly to be erected in the Rhondda Valley, Glamorganshire, from plans prepared by Mr. Charles C. Jones, architect, 44, Charles-street, Cardiff.

At the annual meeting of the Scottish Right of Way and Recreation Society held on Friday, under the presidency of the Lord Provost of Edinburgh, resolutions were adopted in favour of Mr. Bryce's Rights of Way (Scotland) Bill, and congratulating the directors on the issue of the Glen Doll right of way case.

The Metropolitan Board of Works will consider to-day (Friday) the following recommendation from the Works Committee of the whole Board:—"That, having regard to the evidence given by Mr. Fleuret and Mr. R. C. Driver before the Royal Commission appointed to inquire into certain matters affecting this Board, neither of them be again employed professionally on behalf of the Board."

It was decided on Monday that the Jubilee memorial at Liverpool shall take the form of a tower, with clock and chimies, to be added to University College, from designs by Mr. Alfred Waterhouse, B.A., P.R.I.B.A., who estimated the cost at £5,020, exclusive of clock and chimies.

The foundation-stone of an Episcopalian parsonage about to be built at Lochbuie, in the Island of Mull, was laid on the 21st June. The style is Early Scottish, harmonising with the adjoining church. Mr. David MacIntosh, of Oban, is the architect; and Mr. McColl and Graham, of Oban, are the contractors.

A new mission room at Abergwynfi, near Maesteg, is now in course of erection, and accommodates 181 adults. The architects are Messrs. Halliday and Anderson, of Cardiff and Llandaff.

The Building Committee of the Blackburn Technical School decided, on Monday, to commence the smaller scheme at once, which means building a part of the new Technical School only at a cost of £16,000, and the architects, Messrs. Smith, Woodhouse, and Willoughby, are instructed accordingly. The subscriptions to the scheme have not come in as fast as was expected, amounting at present to about £13,000. We illustrated the selected design on the 18th May last.

## STATUES, MEMORIALS, &amp;c.

ABERDEEN.—The Marquis of Lorne unveiled last week the colossal statue of William Wallace, erected under the terms of the Steill bequest at Aberdeen. Designs for the statue were invited by the trustees from sculptors in the United Kingdom, and also in France, Germany, and Italy, by open competition in 1884, to which twenty-five artists, both British and foreign, responded. Three designs were selected, which the artists were invited to revise. The design ultimately chosen was that of the late William Grant Stevenson, A.R.S.A., Edinburgh. It is the largest bronze statue in Scotland, and weighs about six tons, the granite in the pedestal weighing over 200 tons. The pedestal is over 17ft. high, and the statue 16ft. The figure is supported mainly on the right foot, the left being advanced and raised on a projecting rock. The right hand grasps a two-handed sword, while the left is outstretched, the whole action being intended as expressive of the spirit of Wallace's reply to the friars sent to him by the English king before the Battle of Stirling Bridge, "Go back and tell your masters that we came not here to treat, but to fight and to set Scotland free." The base, which was erected by the firm of Messrs. Adam Mitchell and Co., builders, under the superintendence of Councillor Morgan, their senior partner, is supported on a concrete foundation, 3ft. thick and 18ft. square. A middle base course 18ft. square is composed of Corennie granite, and consists of two steps and a plinth with splay. Above this is a dressed portion 6ft. high, surmounted by a pedestal of rustic stonework. On the base course bronze panels are placed bearing inscriptions culled from events in the life of the hero. The statue—which was cast in bronze at the foundry of Messrs. H. Young and Co., Ecclestone Ironworks, Pimlico—has with its base cost Mr. Steill's trustees £3,250, apart from other indirect expenses involved. Their art advisers in Edinburgh were, as stated, Sir J. Noel Paton and Dr. Rowland Anderson; and in Aberdeen, Mr. A. Marshall Mackenzie, of Messrs. Matthews and Mackenzie, architects.

## CHIPS.

The stained-glass window which has been placed in the south transept of the parish church of Ashford, Kent, in remembrance of the forty years' incumbency of Canon Alcock, is now complete. The four lights into which the window is divided are filled in respectively with figures of St. Mary the Virgin, St. John the Evangelist, St. John the Baptist, and St. Elizabeth. The artists are Messrs. Powell, of Whitefriars.

The ceremony of laying the foundation stone of the new Hospital for Infectious Diseases for the King's Norton rural sanitary authority was performed on the 28th ult. The hospital, which is being erected at a cost of about £5,200, exclusive of the value of the land, is situated at West Heath, midway between King's Norton and Northfield, and will provide accommodation for twenty adult patients.

The Blacksmiths' Company will shortly hold an exhibition of work exemplifying the trade of a blacksmith. Prizes will be offered, and competition is invited amongst journeymen and apprentices.

At Glasgow Dean of Guild Court on Friday, authority was given to erect a church, halls, and other offices, at the corner of Meadowpark-street and Finlay Drive, Dennistoun, in connection with the Evangelical Union body.

A carved oak altar table, with two super-altars and tabernacle complete, together with some other sanctuary fittings, were dedicated at St. Mary's Steps Church, Exeter, on Sunday week. They have been carried out by Mr. Harry Hems, of Exeter, from designs by the new rector, the Rev. E. Square.

The parish church of St. Michael-le-Belfry, York, is about to be restored from plans and in accordance with a report by Messrs. Domaine and Brierley, of that city.

Memorial stones of a new Liberal Club now in course of erection at Fallsworth, near Ashton-under-Lyne, were laid on Saturday. Mr. David Jones is the architect.

Mr. Charles C. Jones, M.S.A., of 44, Charles-street, Cardiff, has been appointed estate surveyor to the Pentwyn Estate, Whitchurch, the property of Mr. Hugh Jenner, Hereford.

The death is announced of Signor Luigi Mussini, Director of the Gallery of Paintings at Siena, and himself a distinguished artist. One of his works, a picture describing an historical game of chess between the Cardinal Ruy Lopez and a Calabrian surnamed Il Putto, is now on view at the Italian Exhibition, Earl's Court.

The Darwen town council have appointed Dr. Armitage medical officer of health for the borough.

## Our Office Table.

A BILL has been introduced by Mr. Whitmore to give to the Home Secretary, pending the election of the London County Council, and subsequently to that council, powers to restrict the excessive height of buildings in existing streets in London. Under the Metropolitan Management Act the Metropolitan Board of Works has such powers in the case of new streets; but in the case of existing streets neither the Board nor any Government department has any power to restrict the height of buildings. The proposal is, that no building, except a church or chapel, shall be erected in a street, thoroughfare, or place of less width than 60ft., which shall exceed 60ft. in height; and as to streets, &c., of greater width, any building, except a church or a chapel, must not exceed in height the width of the street, &c. If it be desired to infringe these regulations the consent of the county council, when established, and until that time of the Home Secretary, must first be obtained. By transgressing the rules thus laid down a person is to make himself liable to a penalty of £5, and a further penalty of 40s. for each day during which the offence continues.

THE preliminary arrangements for the meeting of the British Association at Bath this year have just been published. The meeting will be under the presidency of Sir Frederick Bramwell, and will be opened on Wednesday, September 5. The local committee, in consideration of the probable insufficiency of the existing accommodation for the purposes of the reception-room, are erecting a temporary building adjoining the assembly rooms. The Presidential Address and the evening lectures will be given in the drill-hall. The local secretaries anticipate that the holding of the International Geological Congress in London this year, with the unique geological features in the neighbourhood of Bath, will promote the success of the meeting. All the chief objects in Bath will be easily accessible. The old Roman bath and its adjuncts, lately uncovered, with other remains, will be of prominent interest; the new building erected by the Corporation to meet the increasing demand for the Bath waters, and the Literary and Scientific Institution, with its reading-room, library, and museum, will be open. The secretaries remark that Bristol and Clifton in one direction, Gloucester and Cheltenham in another, Salisbury, Stonehenge, and Southampton in a third—all present strong attractions, and the cathedral of Wells may be reached by a short journey along the Cheddar Valley.

THE death is announced, at the age of eighty-two years, of M. Alfred Armand, the well-known architect and numismatist, at his residence, 7, Boulevards des Capuchins, Paris. M. Armand designed the stations on many of the French railway systems, including those on the Calais, Lyons, and St. Germaine lines, notably the St. Lazare terminus, familiar to all visitors to Paris by the Dieppe and Harve routes. This station is now being reconstructed on modern lines from the plans of M. J. Lisch. The late M. Armand also designed the Hotel du Louvre and the Grand Hotel. Since 1855 he has been an honorary corresponding member of the Institute of British Architects.

MR. WILLIAM JAMES BISHOP, who for nearly half a century was connected with the Liverpool School of Art, died on Monday at the ripe age of 83 years. He went to Liverpool 53 years ago, and was attached to the Liverpool Academy of Art, first as a student, then as a member, subsequently as an associate, and eventually as President, a post to which he was elected in 1848. Seven years prior to this he was appointed to the head-mastership of the School of Art connected with Liverpool College. This position he resigned in 1884, having thus completed his 43rd year of service as chief of that institution. On his resignation a testimonial amounting to £1,150, contributed by old pupils, and other friends and admirers, was raised. This sum was invested in the purchase of an annuity, and Mr. Bishop had since lived in retirement in Queen's-road, Liverpool.

AN art museum erected by Mr. Pyke Thompson, in his grounds at Penarth, near Cardiff, to house his collections, was opened on Tuesday

week. The building is Classic in style, has been built from designs by Mr. Edwin Seward, R.C.A., of Cardiff, and will be known as the Turner House. Besides a single drawing by that artist, and a selection from his prints, it contains about forty examples of English water-colours, including David Cox, De Wint, Cotman, Copley Fielding, and Miss Clara Montalba, numerous etchings, ranging from works by Rembrandt and Hollar to those of Whistler and Haden, and also examples of porcelain and china. The gallery will be open on Sundays as well as throughout the week.

THE Liverpool city magistrates received on Thursday in last week the report presented by a special committee appointed some time since to inspect the city theatres with reference to the provision for the safety of the public in case of fire or panic. It was found in every recorded instance of fires in theatres that they originated on or behind the stage, and in no instance had the fire broken out in the auditorium. If, therefore, a solid wall of sufficient thickness was built, entirely separating the two portions, the few necessary openings being fitted with iron doors, the only difficulty to be dealt with was the stage opening or proscenium. The committee had had before them various designs and plans of fireproof curtains, and had inspected some, particularly that of the Prince of Wales's Theatre in London, which seemed to the committee to comprise everything which could be desired for the public safety. There were various modes of carrying out the principle of the fireproof curtain; but the committee had insisted that such a curtain should be provided in each of the Liverpool theatres, and also that certain improvements should be made in some of the exits and staircases. The report of the committee was adopted, and subsequently the justices renewed the licenses of the Alexandra, Court, Rotunda, Adelphi, and Grand Theatres, and of Hengler's Circus, the respective lessees giving an undertaking to complete such alterations as were not already finished.

ARRANGEMENTS have now been made for holding the tenth annual Ecclesiastical Art Exhibition in connection with the forthcoming Church Congress at Manchester. The loans will embrace goldsmiths' and silversmiths' work, ancient and modern, ecclesiastical metal work in general, embroidery, needlework, tapestry, wood and ivory carving, ecclesiastical furniture, paintings, drawings, architectural designs for churches and schools, photographs, books, and MSS.

WHAT are the "arms" of the city of Bath? Complaints were raised at Tuesday's sitting of the city council of Bath that the surveyor of works, in repairing the Guildhall, had entirely changed the coat of arms thereon emblazoned, it is alleged, without authority. Alderman Clarke remarked that he was not sure what the surveyor of works would not do under the head of "repairation." Here was a building which had been erected over 100 years; the arms of the city had been cut upon it, and on maps of the city of 200 years ago there was the same arms exhibited. Now the arms had been remodelled, and were quite different to what they were before. Mr. Quin said whenever the specification was brought up for the renovation and restoration of the Guildhall, on each occasion he said, "Let it be understood that no alterations shall be made in any feature of the building." That point met with the general approval of the council. Alderman Chaffin said a meeting of the Corporate Property Committee has been convened especially to consider the question, and would report hereafter whether the coat just cut was the real arms of the city or spurious.

A SCHEME of reorganisation has been adopted by the Liverpool City Council in the Nuisance Department, consequent on the retirement of the Chief Inspector Fitzpatrick on a superannuation allowance. A medical man (Dr. E. W. Hope), at present assistant to the medical officer of health, will be appointed chief inspector of nuisances, with entire control of the whole department, and the salary will be raised to £50 a year; while the new superintendent, Inspector Cooper, will be paid £150 a year only. By the rearrangement, it is believed that the administration and general efficiency of the department will be improved, while a monetary saving of £210 a year will be made.

**MEETINGS FOR THE ENSUING WEEK.**

**SATURDAY (TO-MORROW).**—Edinburgh Architectural Association. Annual Excursion to Elie, St. Monance, Balcaskie House, and Kellie Castle. Meet in Booking Hall, Waverley Station, 9.15 a.m.

**THURSDAY.**—Municipal Surveyors' Association. Annual meeting at Institution of Civil Engineers. General meeting 12 noon. Papers by H. U. McKie, G. R. Strachan, and Lieut.-Col. Jones, V.C. 2.30.

**FRIDAY.**—Municipal Surveyors' Association. Annual meeting at Institution of Civil Engineers. 11.30 a.m.

**SATURDAY.**—Trip by steamboat from Temple Pier 11 a.m. to inspect the Tower Bridge and new Outfall Works at Barking.

**Architectural Association.**—Visit to Laver Marney, July 14. Start 8.50 a.m. Postal order, 5s., to Mr. Ernest S. Gale, 5, York-buildings, Adelphi, not later than July 11.

**Trade News.****WAGES MOVEMENTS.**

**LEEDS.**—A strike amongst the Leeds joiners and carpenters fairly commenced on Monday, when the six months' notice given by the masters for alteration of rules came to an end. The men ask an advance from 7½d. to 8d. per hour for working time, time and a quarter for the first two hours of overtime, and time and a half for all time after the first two hours up to 7 a.m.; the abolition of piece-work; and six months' notice from either side for any alteration of the working rules, the said notice to expire on the 1st of July in any year. The men working under the following five firms gave one day's notice on Saturday morning to terminate their engagements:—Messrs. J. H. Thorpe, Nicholson and Son, Tomlinson and Sons, Irwin's, and Craven and Umpleby. The men at these establishments have come out almost in a body, the unionists having been joined by the non-unionists. They base their claim for an increase in their wages on the fact that the trade has improved in an appreciable degree since 1879, when wages were lowered from 8d. to 7½d. per hour, and they believe they have selected the five firms which, being the busiest, are least able to suffer a stoppage of work.

**CHIPS.**

The shareholders of the Westminster Aquarium have adjourned for a week, until Wednesday next, the consideration of a scheme for selling the buildings to a new company for £330,000, the proposal of the promoters of the new undertaking being to erect on the site, at a cost of £400,000, a very large hotel facing the Houses of Parliament, and a large block of offices, chambers, &c., eight stories high, along the whole length of Tothill-street.

The reopening of St. Mary's Church, Studley, after internal restoration, took place on Thursday, the 28th ult. The alterations and additions include an improved heating apparatus on the hot-water system of Messrs. Renton, Gibbs, and Co., Liverpool. New open seats of pitch-pine have been substituted for the old pews, this work having been carried out by Messrs. Skelton and Co., of Birmingham, and another feature is the enlargement and repair of the organ by Messrs. Hewins, of Stratford-on-Avon. Mr. J. Jones was the clerk of the works.

The death is announced from Mhow, Central India, of Major A. S. W. Connor, executive engineer, M. W., in the Public Works Department.

**DOULTING FREESTONE.**

**THE CHELYNCH STONE.**—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

**THE BRAMLEDITCH STONE** is of the same crystalline nature as the Chelynoch Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

**HAM HILL STONE.**

Greater facilities have been provided for working these Quarries, and the Stone can be supplied in large quantities at short notice.

Prices and every information given on application to  
**THE HAM HILL STONE CO.,**  
NORTON, STOKE UNDER-HAM, SOMERSET.  
London Agent:—  
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

**Holloway's Pills.**—This medicine embraces every attribute required in a general and domestic remedy; it overturns the foundations of disease laid by defective food and impure air. In obstructions of the liver, lungs, bowels, or any other organs these Pills are especially serviceable. They never cause pain or irritate the most sensitive nerves or most tender bowels.—[ADVT.]

**HYATT'S LENS and "SEMI-PRISM"**  
LIGHTS for PAYMENTS, STALLBOARDS, ROOFS, &c.  
TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

**WM. OLIVER & SONS,**

The most extensive Stock of every kind of  
Wood in Planks and Boards, dry and fit for  
immediate use.

**TENDERS.**

\*.\* Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

**ADDLESTONE.**—For alterations and additions to Tudor House, Addlestone, Surrey, for Mr. D'Arcy S. Blackburn, Messrs. Maynard and Stutfield, 6, Great Queen-street, surveyors:—

Gale, A. A., Woking*	...	...	£1,397 10 0
Martin, J., Addlestone*	...	...	1,385 0 0
Knight, T., and Sons, Chertsey	...	...	1,275 0 0
Ansell, C., Lambeth...	...	...	1,122 0 0
Kirk Bros., Battersea (accepted)...	...	...	980 0 0
Brown, W., and Sons, Addlestone*	...	...	955 0 0
* Received too late. Surveyor's estimate £1,000.			

**BATH.**—For building works at the workhouse, for the City Board of Guardians:—

Long (accepted)...	...	...	£69 0 0
--------------------	-----	-----	---------

**BALHAM, S.W.**—For painting, papering, and decorating at Byrne-road, Balham, S.W. Mr. E. H. Selby, 26, Craven-street, Strand, architect:—

Kirby and Chase (accepted).

**BOURNEMOUTH.**—For supplying and fixing between the sea-water pumping station and the reservoir towers two sets of electro-mechanical water level indicating apparatus (Jennings and Brewer's patent), for the Bournemouth Improvement Commissioners. Mr. G. R. Andrews, surveyor:—

Jennings, G., London (accepted).

*To Municipal Authorities, Engineers, and Surveyors.*

**JENNINGS' PATENT URINALS**

FOR PUBLIC THOROUGHFARES AND RAILWAY STATIONS,

Have been adopted in all the principal European Cities. They are particularly adapted for public use, being simple in construction, strong, and most economical as regards the water supply.

**JENNINGS' STONEWARE DRAIN-PIPES**

Have been specially selected and adopted, after severe tests, by the South Australian Government for the drainage of Adelaide. The Sockets and Pipes are made in one piece under great pressure by Steam Machinery from the finest selected Poole Clay taken from Beds on the works, and, by hydraulic testing, have been proved superior to any other pipes in the market.

Prices and particulars can be obtained from

Telegraphic Addresses:—London Office: "JOHN KNOWLES, London." Works Office: "KNOWLES, Woodville." Telephone No. 7587

*Notes.*—The measurement of drainage is

extremely simple; but as drainage plans are usually to a very small scale, very accurate dimensions must be taken. The pipes are measured by the foot-run. Describe the kind of pipe, if jointed in puddled clay, or Portland cement, or Stanford's patent joints. The average depth of digging is included with the description. If the dimension is an odd number of feet, it must be written as even, as a length of pipe is 2ft. Count the number of bends, junctions, diminishing pieces, and siphon traps. Some surveyors state the sizes of junctions and diminishing, thus:—"4in. to 6in."; but others would write "6in. junction," and the price is always taken as the larger size. The inspection chamber is taken as any other part of the building; the dimensions are given in full.

#### THE METROPOLITAN BOARD OF WORKS INQUIRY.

THE Royal Commissioners continued their investigations into the proceedings of the Metropolitan Board of Works at the Westminster Sessions House on Friday.

Mr. John Hebb, assistant architect to the Metropolitan Board of Works, was recalled. Before his examination was continued he said: I should like to call your lordship's attention to the fact that I am not represented by counsel. In the remarks which your lordship was pleased to make with regard to the Brixton-road frontage, that the Board ought not to have intrusted this matter to a temporary official, it was suggested that I was incompetent for the work. I should like to tell your lordship that I have been educated as an architect. I was articled to an eminent man for five years. I travelled abroad for some time to complete my education. On my return I joined my master, first as assistant and afterwards as his partner. I was his partner for about ten years, carrying out some important works, assisting him in all his buildings, and practising at the same time on my own account. I came to the Board of Works with excellent testimonials. I have performed very important duties. I have the control of all work in connection with the operation of the Building Act and the Metropolitan Management Act so far as relates to buildings. I have acted as superintending architect, by Mr. Vulliamy's appointment, with the consent of the Board. I am a man, I submit, in every way of equal professional status to Mr. Vulliamy, and am perfectly competent to perform the work in question. Your lordship made remarks about me which, I think, are calculated to cast a slur on my professional character. I have never had any slur or imputation cast upon me until the last few months. I have always been looked upon as an honourable man; I am an honourable man, and there is no transaction of my life that I am ashamed of or that will not bear the light of day.—Lord Herschell: I think that possibly it would be better not to make that observation after the correspondence which has been brought before us relative to these applications for orders for theatres. I hope you now see that that was an improper proceeding.—Witness: Your lordship may form your own opinion. I do not consider that that was any imputation on my honour or honesty. I was led into that correspondence by Mr. Harris. There is nothing in that correspondence of which I am ashamed. It is utterly false to say that I levied blackmail on Mr. Harris or any other man. Mr. Bosanquet: Had you any appointment from the Board to inspect theatres?—Witness: I had. I have not got the appointment here; but the form of it is that I am authorised to inspect theatres at any time of the day or night. Your powers are to inspect the theatres with regard to keeping open doors at any time during the performance, or any other convenient time?—Yes. Did you make any memorandum of the times you went to inspect under those powers?—No. Witness admitted that on one occasion he wrote Mr. Harris as follows: "Will you let me have a box? You know I am authorised at any time to go into the theatre." Witness admitted that in another letter he asked for passes, adding that he did not like to go to the theatre alone. Lord Herschell: Do you suppose that you had the power to go into the theatre and take the best seat during the whole of the performance?—Witness: No, I do not. I never forced myself into the theatre. I deferred to

the convenience of the lessee. Lord Herschell: Your power was to see how the theatre was constructed?—Witness: It was part of my duty to see how the audience left the theatre. Lord Herschell: That would be just before the audience were leaving?—It would, my lord. You could have stood by the door and seen that?—Yes. Further questioned, witness admitted that on another occasion he was refused admission to Her Majesty's Theatre, and he reported the fact to the Board. Lord Herschell: Did you ever ask for box or stall tickets at that theatre?—No, my lord. Will you swear that?—Yes. Lord Herschell here observed that it was the duty of Mr. Hebb to supervise the theatres; but he certainly had no right to have asked for favours as he had done. Lord Herschell (to witness): Having regard to what has been elicited in the course of this inquiry, do you not think that by asking for these passes in this indiscriminate manner your conduct was improper?—Witness: I admit that it was indiscreet, but it was not improper. I was not guilty of any impropriety, although my conduct may have been indiscreet. I had no motive in asking for these passes, nor had I any intention of threatening or doing anything which was not honest and straightforward, and that is all. I say no more. Mr. Winch: Supposing any structural alterations were required, who would have the supervising of them?—I should have. Would plans be submitted to the Board?—Plans are sometimes submitted. Have you ever received any commission from any architect in respect of plans submitted to the Board?—Never. Nothing of any kind?—Never.

The witness was next examined on the question of the line of frontage in Brixton-rise. He said that he only knew of one person who had expressed dissatisfaction. That gentleman had suggested corruption, and had written a letter to the *Times*. Lord Herschell remarked that it could hardly be said that only one man had expressed dissatisfaction on the subject, inasmuch as a considerable deputation waited on the Board in reference to it. Witness submitted that he was not concerned with the appearance of Brixton-hill, but simply had to find a matter of fact. The decision which he arrived at was an honest one, and was the result of considerable reflection. Lord Herschell: The important question is whether it was an honest one?—I say that I had no communication with anybody. I decided it entirely on the merits of the case without any reference to anybody interested in the matter. Lord Herschell: You seem to be displeased about some observations which I made, and which you think reflected on your competency. I say nothing about that, but simply that your decision in this case is an unintelligible one.—The witness said that Mr. Vulliamy consulted him on nearly all questions of frontage, and he followed the conditions of the office. He had decided other lines of frontage. In this case there was some vestry squabble of which he was perfectly ignorant, and which caused all the trouble. By Lord Herschell: Witness's duties were confined to the Building Act Department. He had been in no way directly or indirectly concerned in the sale or purchase of lands. In answer to Mr. Meadows White, witness said he had been articled to the late Mr. Edward P'Anson. The witness was examined at length by Mr. Meadows White relative to the structural alterations of theatres. He denied that he told Mr. Emden, upon his inquiry as to the objections in regard to Terry's Theatre, that he must go and read the Board's by-laws. He suggested to Mr. Emden what the difficulties were. The theatre was treated in precisely the same manner as all others. If there was any delay in the passing of plans it was simply through the action of Mr. Emden, who tried to force two sets of plans on the Board which they declined to accept. With regard to the Avenue Theatre, Mr. Sefton Parry came to witness in great trepidation and tried to bribe him. Lord Herschell: What did he offer you?—Witness: He asked me whether I could act as his architect, which I declined. The matter was referred to the Building Act Committee. Witness admitted that he had made some trifling mistakes in what he alleged was objectionable in connection with this theatre; but these did not affect the principle that the construction in the place then referred to was defective. Lord Herschell: Have you in any case acted for or advised any

person professionally outside the Board?—Witness: No. You have done no professional work except that which you have done for the Board?—None. I did act once in a friendly way for the construction of a panorama in Leicester-square. This came to me through a French architect, who asked me to act for him. I applied to the Board, and they refused to allow me to act. I immediately turned over the work to another architect, and I received no payment whatever.

Mr. James Willing, advertising agent, pointed out that the name of "Mr. Willing" appeared in the official report of the proceedings three times in connection with the giving of money to Mr. Matthew Goddard. He was not the Willing referred to. The name of the person who made the payment was Willing, not Willing.

Mr. Earle Bird, owner of the Albany-road Estate, Camberwell, was then called. He explained that the plans for laying out that estate were made by Mr. Evans, who told him that the estate was for sale. There was a difficulty in getting the plans passed. He thought it might be by reason of Mr. Evans's inexperience as an architect, that gentleman having hitherto been a builder, and he then engaged Mr. Fowler and Mr. Saunders. Mr. Fowler had long been his architect, but he had never employed Mr. Saunders before. Witness asked Mr. Fowler to overhaul the whole of the plans and ascertain why they had been rejected. The development of the estate had been delayed six months, involving a loss of quite £2,000. Mr. Fowler suggested another outlet on the plan, and drew another tracing. Did Mr. Saunders make a plan?—No. What did he do?—To make the thing thoroughly safe I thought we had better employ Mr. Saunders and let him also examine the plans, which he did. He made an alteration, giving more space to the parish by widening a footpath. A considerable time still elapsed before the plans were passed. I paid Mr. Fowler £50 and Mr. Saunders 50 guineas. Mr. Winch: Did you know Mr. Saunders was a member of the Board?—Yes. You knew that he would have to consider the plans?—I thought so. Mr. Saunders drew one line on the plan, and charged you 50 guineas for it? He did not charge me. I gave it to him, and was glad to get out of it for that.

Mr. F. Hards, auctioneer and valuer, Greenwich, gave evidence in reference to the transactions in which he was jointly interested with the witness Bradley, a clerk in the Architects' department of the Board, who was called at the previous sitting of the Commission. For the cottages in Europa-place, Battersea, they gave about £460. They were sold to the Board of Works for £700. A builder had been sent to repair the property. It was not the practise for an agent to put his name in the conveyance when he was dealing in a speculative property. Witness admitted that with reference to one site, for which £15,000 was offered, he sent a letter to the Board stating that his client was dissatisfied with the amount. Pressed by Lord Herschell, he admitted that he had no client for the site. He was himself the client, and he pretended that he had a client. Further questioned, witness said he gave Bradley £500 out of one transaction, he having served him in a similar generous way on a previous occasion. Witness surveyed the property as though it had not belonged to him, and charged his fee to the Board for so doing.

Mr. Frederick Gordon stated that he tendered for plots in Northumberland-avenue on which the Grand Hotel now stands. The land was afterwards assigned to a company. Mr. Saunders was employed as architect, along with the Messrs. F. and H. Francis. Was not one architect enough?—It was a very large undertaking, and I thought I should like to have two heads. Had you made any communication with Mr. Saunders before you made tender?—I have no doubt that the matter was talked over with him and Messrs. Francis. Witness said that he and two co-partners purchased the site of the Hotel Métropole, and assigned the interest in the contract to the hotel company. Messrs. Francis and Mr. Saunders were the architects. He had many interviews with Mr. Saunders with reference to the site. Mr. Saunders had no interest in the matter beyond that of architect.

At Tuesday's sitting of the Royal Commission Mr. Frederick Gordon, re-examined, stated that

after he had offered 26 years' purchase for the freehold of the Grand Hotel site, he was astonished to find two years afterwards that a ground-rent lower down the Northumberland-avenue was sold to the Colonial Institute for 25 years' purchase. By Mr. Winch, Q.C.: He made £12,000 over the re-sale of the Hôtel Métropole. He had built four hotels—the Grand, the Métropole, the Holborn Restaurant, and the First Avenue. Mr. Saunders was the joint architect in respect of the Hôtel Métropole, and sole architect for the Forest Hotel at Chingford. The latter was Corporation property. Neither the Holborn Restaurant nor the First Avenue Hotel had anything to do with the Corporation or the Metropolitan Board of Works. Mr. Saunders was employed on the Grand Hotel at witness's own desire. Mr. Winch: You knew he was a member of the Metropolitan Board?—Yes. Did you know he would have a voice in passing the plans?—I cannot say that I considered that. I knew that he would understand the routine of the Board with reference to buildings and frontages, and so on, undoubtedly. Did you know that he would have a voice in passing and approving the plans?—I should have thought that unlikely. You thought he would abstain?—Certainly I should as a public man. Does it not strike you as strange that you did not employ him as architect in respect of sites in which the Board of Works or the Corporation had nothing to do?—I employed him in connection with the Royal Forest Hotel at Chingford. That was a Corporation site?—Yes. What would be the amount of his fees in regard to the Grand Hotel?—I paid to Messrs. Francis and Saunders £7,128 17s. 6d. Mr. Saunders would have half of that amount?—I presume so. What did Mr. Saunders do in connection with those plans?—I really cannot say. I understand that Mr. Saunders did advise you as to the price you were to offer for the ground-rent for the Grand Hotel and the Hôtel Métropole?—I believe he stated what had been offered before. He told you what price to tender?—He might have mentioned that he thought less than a given sum would not be taken. That would be a sufficient hint for anyone tendering?—I instructed Messrs. Francis to tender under the amount that he mentioned. I tendered £8,000, and £9,000 was ultimately accepted. Answering further questions, the witness said there was considerable delay in passing the Grand Hotel plans. Objections were made by the Royal Institute of British Architects. There was not this delay in connection with the Hôtel Métropole. Mr. Saunders received 150 guineas for advising as to the site prior to the building of the Hôtel Métropole. Mr. Saunders's name appeared with that of Messrs. Francis on the Grand Hotel plans. Why did his name not appear on the Métropole plans?—I am not aware that his name did not appear. I should have expected it to appear. Although the transactions have been very large, I have never been asked for anything by any employés of the Board, nor have I ever made any payment to any.

Mr. Frederick John Francis said that he was joint architect with Mr. Saunders in the Grand Hotel and the Hôtel Métropole. They were both employed as architects about the same time. Witness prepared the plans of the Grand Hotel. Lord Herschell: Did Mr. Saunders take any part in the preparation of the plans of the Grand Hotel?—Witness: Oh, yes; he did. He consulted me on some things in connection with the plans. As to the Hôtel Métropole, you were appointed architects about the same time?—Yes; I think Mr. Saunders was the first spoken to. Mr. Gordon asked both us and Mr. Saunders to prepare an elevation. Ours was preferred, and it was carried out. Was any plan prepared by Mr. Saunders beyond that elevation which was not adopted?—He assisted us in the preparation of the plans. Had you any arrangement with Mr. Saunders to divide the commission in the case of the Grand Hotel?—I think we did. You seem to have done the lion's share of the work?—I think our firm did. Mr. Winch: Did you get, in respect of the Grand Hotel, any material assistance from Mr. Saunders?—Witness: It is rather an invidious question. I do not think he did anything but what we could have done ourselves just as well. With regard to the Grand Hotel, what did he do?—I do not think he did very much. He assisted us. He drew a

line or two?—I think that is putting it a little too strong. The agreement was that if you applied for the land and got it, Mr. Saunders was to be joint architect?—Yes. Was it the same for the Hôtel Métropole?—Yes. Has Mr. Saunders been joint architect with you in anything else?—Nothing else. There was delay with regard to the Grand Hotel plans in consequence of the Institute of Architects?—Yes. Was there any delay on the part of the Board of Works?—We considered them dilatory. Some of the delay was owing to the action of the Institute of Architects?—Certainly. Mr. Meadows White: Can you give me instances where there was dilatoriness on the part of the Board?—One very conspicuous instance was that of Trafalgar-buildings, opposite the Grand Hotel, where the National Liberal Club was for five years. There was vexatious delay on the part of the Board. By Mr. Winch: No member of the Board was employed as joint architect in respect of Trafalgar-buildings.

Mr. George Brick, a builder, was examined by the President with reference to the action of a Mr. Brown, a member of the Metropolitan Board, as to a dangerous house in Lisson-street, which had been condemned. The house was let at a high rental to a "sweater." A dangerous and defective party wall was allowed to remain for more than a year, although it had been condemned, and people were allowed to live in the building of which it formed a portion. Witness, in pursuance of notice, shored up his wall, and did so to the satisfaction of Mr. Peebles, the district surveyor. Mr. Meadows White, Q.C., asked the witness why he did not pursue the ordinary course under the Metropolitan Act of pulling the wall down?—Witness: Because Mr. Brown came to me and said, "I am a member of the Board, and I will bring a big man to smash you if you do so." In answer to other questions, witness said Mr. Brown subsequently brought Mr. Thomas, of the Dangerous Structures Department, to inspect the building. The work had not been done yet. Mr. Meadows White, Q.C.: Do you mean to suggest that the district surveyor was bribed?—I mean to say that the work has not been done yet.

Mr. George James Thomas, superintendent of the Dangerous Structures Department of the Metropolitan Board of Works, stated that Mr. Brown, about the end of April, asked him to go and view the place and advise him. He asked the permission of Mr. Vulliamy to go, as this was no part of his duty. This was granted him, and he went, and found a large fissure in the wall, but there was no immediate danger, as it was shored up. He did not see Mr. Brick there. The only person he saw on that occasion was Mr. Brown. He was afterwards instructed by the Board of Works to see whether the fissure in the wall had been remedied, and he discovered, on examination, that it had. Witness reported the result of his visit to Mr. Vulliamy, and told him that, in his opinion, there was no immediate danger, and Mr. Vulliamy said that the matter might as well stand over for a month or two. Mr. Studd: Did Mr. Brown give you anything?—No. Has your salary been raised since then?—It was raised two years ago. Did Mr. Brown move that it should be raised?—I don't know that he did.

Mr. George Brown, a member of the Metropolitan Board of Works, was next examined with reference to his property in Lisson-grove, Marylebone, and denied *seriatim* the statements made by Mr. Brick.

Sir Joseph W. Bazalgette stated that from 1856 to 1870 there were three assistant engineers. In 1870 one retired, and Mr. E. Bazalgette was appointed. At the present time there were three assistant engineers, and their duties were to attend generally to the drainage and special works in the districts. The bridges formed an important feature, and the prevention of floods over 40 miles of the river frontage. They had also to see to the execution of contracts in connection with these works. It was part of the duty of witness to advise as to whether the contractor did his work well; but the inquiries into the position of a contractor were instituted by the solicitors. Since the Board had been in existence the works carried out by the Engineering Department had cost £8,000,000, and he produced a list of the contractors, showing how the money had been spent. There was a regular form for the tenders. A large number of works had been

carried out by Mr. W. Webster, his tenders being generally the lowest. Lord Herschell questioned the witness with respect to the Battersea Bridge improvement. Mr. Grant, who died this year, would have had to do with Mr. Webster's contract at Crossness. As to who the district surveyor would be he (witness) would ascertain. Sir Joseph was then asked by the President to get out particulars about the cartage contracts, and also further information about the Crossness Pumping Station. The Commission adjourned till to-day (Friday).

The following letter with reference to Mr. Hebb's evidence on Saturday appeared in Monday's *Standard*:—

"Mr. Hebb says that the dissatisfaction with the Brixton-rise award is got up by 'one man,' *i.e.*, myself. The award was condemned by the Lambeth Vestry (one hundred and twenty members), except so far as one member was benefited by it, and he could avert the opposition of his friends. It was practically condemned by the Metropolitan Board, because, by a clause in their Omnibus Bill of this session, they proposed to give an appeal against any decision of the superintending architect, and named the Brixton-rise case as the reason for the clause. Mr. Broadhurst had publicly threatened in the House of Commons that he would obstruct all the Board's business unless they altered the law which gives so much power to one man without appeal. Mr. Broadhurst was one of the deputation which went to the Board on this subject; he insisted upon my being the spokesman of the deputation, in the absence of a neighbour who was too ill to leave home; but the deputation was surprised that Mr. Broadhurst was not allowed to speak after me. Mr. J. F. Reid, Mr. Dann, Mr. J. W. C. Washington, Mr. W. Morris, Mr. Jennings (agent for the Hayter Estate), and others were active in their hostility to the award. When Mr. Hebb says he was not concerned with the appearance of Brixton-rise, he ignores the highest function of the office he temporarily filled—*viz.*, to adjust public and private interests in frontage lines.—WILLIAM STORE, 3, Lambert-road, Brixton-rise, July 7."

#### WRIGHT, SUTCLIFFE, AND SON'S PATENT WASTE WATER CLOSET.

THIS closet, of which we give a sketch, is suitable for farm-buildings, barracks, factories, board schools, artisans' dwellings,

railway stations, or workshops. It can be worked in groups, and one or more at a time can be kept at work. The automatic flush, combined with flush handle, for flushing after the closet has been used, is a certainty. It is impossible for the waste water closet to stop up. The closet is fitted with a wood seat complete in itself, and requires no other woodwork. It is impossible for it to freeze up, and the water forms a disinfectant, always flushing, and can be flushed by hand after being used. Automatically all day long the water is collected in the tipper and upset with great force, and will wash out half a stone of wet waste at one flush. It may be fixed outside in the yard, where there is sufficient fall to allow the closet to be fully out of the ground; but it is much better to go down a step or two, or it may be fixed in the cellars under the pavement, or in the yards of dwellings. The closet is perfectly safe when bedded down with cement, and as

firm as it is possible to make any closet. It does not require any woodwork, being complete in itself. All that is required is for the plumber to connect the waste pipe from the house sink to the closet, where, on account of the strong rush of water, the makers recommend the fixing of a 1½ in. "Sutcliffe patent trap" and brass grate funnel top.

#### WAYSIDE NOTES.

"HANKEY'S FOLLY" is about to be extended, and from the so-called monstrosity at Albert-gate the public gaze has been turned to the mammoth pile near St. James's Park Station, which may be taken as a supreme example of the truth of Mr. Garbett's assertion that pure selfishness is at the root of all that is hideous in architectural design. An examination of this mass of bricks and mortar discloses nothing more noble on the part of its builders than a determination to produce a nest of tenements that shall be leased so as to yield the utmost possible percentage on the capital expended. No one, it is true, can prevent persons building in a "Skinflint" style of architecture; but it should be possible to arrest the upward progress of works when they have passed the height of reason, and threaten the light and air of surrounding buildings, and destroy the outlook for miles around. Whether Mr. Whitmore's Bill is the right measure in the right place, it is difficult to say off-hand; but it appears to be a step in the proper direction, and, if passed, should protect us for a time from the selfish encroachments of building promoters, who care not for the commonweal so long as their speculations are a financial success.

Considerable amusement seems to be distilled during the examination of witnesses before the Royal Commission to inquire into the irregularities that have taken place among the "Spring-gardeners," as a contemporary facetiously styles the incorruptible members and officials of the Metropolitan Board of Works. I glance down the latest reports served up to improve, or otherwise, the architect's digestion at the breakfast-table. "Laughter" I find liberally inserted amongst the evidence, and "great laughter" on occasions such as when Lord Herschell naively inquires of a witness as to how much energy his co-worker expended on draughtsmanship in connection with the design of the "Grand," for, and in consideration of, a moiety of £6,000 odd. The witness being uncertain to a line or two, his lordship suggested *three* lines as the sum total of work done, the which humorous suggestion appears to have fairly "brought down the house."

This is no laughing matter. For the public, after hearing about the easy method of earning £450, to learn that the price of three lines or so is £3,000 odd, will make matters worse as touching the pupil-mania referred to last week as the probable result of such facts becoming known. Seriously, however, these disclosures are indirectly undermining the credit of the profession, and I would remind the reader of my suggestions as to the line of reasoning the public will take, especially as all convicted of having acted "improperly" in this matter excuse themselves by saying they do not see what they have done wrong. One of the most curious features about the inquiry is to note how strangely warped are the views of some of those who have been in the witness-box as to what is right and what is wrong. One could pardon many of the "indiscretions" of those concerned if a clean breast were made of things, and the error of their ways confessed. But an endeavour to brazen out the accusations, and to equivocate, savours of childishness, and does not enlist one's sympathies.

Of course, if I exclaim, "What a dearth of competitions!" you must needs advertise three in a lump on the very same day. Well, all the better if they are of a promising nature. The Friars' School at Bangor appears to be a competition quite *sui generis*, as the well-tempered architect remarked of his new office-boy, when the latter upset the inkpot over an elaborate perspective. The scheme proposed seems excellent, and unless there be any stipulations compelling the

expenditure of a lot of time on the drawings, a £20 note will amply reimburse the competitor, if he be an architect of that barndoor description to which I have at times alluded. I opine that the names of architects "of some experience in scholastic buildings" will appear to the Governors of the school to be legion. There are very many, doubtless, who will suddenly come to the conclusion that they have had some experience in school-building, and submit their names to the Governors of the Friars' School, in the hope of winning a "place."

As regards the other architectural competition that you advertised last week—the alterations and additions to a hydropathic establishment—the chief thing requiring consideration will most likely prove to be a system of baths, which, of course, are the main features in such institutions, and to which all others are, in idea, subordinated. The scheme may include the provision of Turkish baths, in which case the readers of the "B.N." should be in a position to tackle the problem. Other bathing provisions are simple by comparison, as many of the hydropathic appliances are of a movable nature. Regular visitors to hydropathic establishments, however, will here have the pull over others, as, simple as the arrangements may seem, it is necessary to know the whole theory and practice of hydropathy before one can design a building in which the treatment may be administered effectively. The worst point about latter-day hydropathic establishments is that they rapidly degenerate into hotels, pure and simple. Few ever maintain a standard like that of the late Mr. Smedley, whose extensive building on the Derbyshire heights will be familiar to many.

I have read your pleasant sketch of the proposed line of route to be followed by the A. A. excursionists in the autumn. It will have the advantage of combining interesting architecture with beautiful scenery. Some few of the places to be visited I know, but could join the excursion with great zest were there not a few other things to be attended to, and ever so many prospected jaunts on the Continent, including a scheme for visiting all the chief cities of Europe in a fortnight! About this time of the year one's fancy commences to lightly turn to thoughts of travelling with a pleasure of anticipation that I firmly believe no one but enthusiastic architects can appreciate.

It seems that, after all, there is some benefit to be derived from stuffing an old church full of incongruous monuments in the worst of taste, and hard and cold enough in design to send a cold shiver all over one. The writer of an article on St. Helen's Church, Bishopsgate, in a daily, makes a plea for the fund for the restoration of the old building—not, mark, for the sake of the architecture *per se*, but because it is so rich in monuments. So long as the money comes in, however, one must not find fault with the plea upon which it was obtained. According to the writer of the article in question, St. Helen's Church is richer in monuments than any in the Metropolis, excepting, of course, Westminster Abbey and St. Paul's. Among them is one to a certain Martin Bond, an officer of the "trained bands" got together at Tilbury in preparation for the great event that didn't come off in A.D. 1588. There is also one to a gentleman of the name of Julius Caesar, or, rather, to a *knight* of that name, a master of the Rolls in the reign of James I. But of the adjuncts of old St. Helen's the chief worth preserving are the brasses of the 15th and 16th centuries. P.S.—In case anyone should wish to subscribe, I might mention that the amount required for the restoration is between £5,000 and £6,000.

The Church House movement is still alive. A meeting of the general committee was held last Saturday, under the presidency of the Archbishop of Canterbury, who said that they hoped that "the good ship, the Church House, would be launched in a fortnight." The site chosen appears to be on the south side of Dean's Yard, comprising all the houses in the terrace except Nos. 6, 7, and 8 (the acquisition of which is still under consideration), with all the land behind, bounded by Tufton-street,

Little Smith-street, and Great Smith-street, the right of purchase of which, for the sum of £26,500, has been secured. This is all interesting; but what I want to especially point out is the remarkable portion of the Bishop of London's speech on this occasion, who is reported to have said that "*they would be bound by no architect's plans*," and, moreover, that "beginning in a small way, they would see exactly what they wanted, and be able to provide accordingly." What is the English of this? Are the clergy also on bad terms with us, or is it the effect of the M.B.W. scandals? Or do they fear an elevation like the Architectural Museum, hard by? Are the builders going to have the job, or what is the meaning of this mysterious dictum? One thing is certain, and that is that the Bishop of London is in error in thinking that anyone can get a more convenient building by not being bound by an architect's plan. When a person is going to build he *thinks* he knows exactly what he wants; but, as we are all well aware, he never can express his desires, and, strange though it seems, the first duty of an architect is to tell his client the nature of the plan that will best suit his requirements. GOTH.

#### TIN ROOFS.

THE tin roof is much in esteem in America, especially in Philadelphia, where it is used in many of the buildings. Of course, there is good and bad tin. The poor tin does not last longer than zinc; but the best tin is said to have lasted 100 years. Many of the old buildings of Philadelphia which have been removed have shown tin roofs that were laid in 1830 quite as good as new. We cannot, however, take all we hear about other metals. It is said that zinc, copper, iron, &c., have all been tried and proved worthless after a few years' exposure, but tin has been found the most lasting of all. Copper is known to be one of the most durable of metals for roof covering, and the old sheets of it laid on the roofs of many of the old churches in this country and France attest the durable nature of copper and its slow oxidation. The protective coating of verdigris entirely preserves the surface from further injury. The durability of tin roofing depends on the perfectness of the tin coating, which, when once injured, allows galvanic action to be set up between the tin and iron.

#### ROYAL ACADEMY ADMISSIONS.

JULY, 1888.

STUDENTS' UPPER SCHOOL.—F. D. Bedford, T. Davison, W. M. Duke, C. S. Haywood, W. F. Horton, H. P. Lancaster, F. C. Ryde, C. S. Spooner, F. J. Verity.

STUDENTS.—T. O. Agutter, C. J. Blomfield, L. C. Cornford, A. Mackintosh, E. A. Rickards, W. J. W. Roome, W. Sheen, J. C. Watt, E. J. A. Wigram.

PROBATIONERS.—F. W. Bedford, D. J. Blow, W. A. Fenn, J. W. Little, J. G. Oakley, J. Paxton, A. M. Poynter, J. Rawlinson, F. E. Smea, E. W. M. Wonnacott, P. S. Worthington.

The new public hall at Caistor has just been opened. The building has been substantially erected by Mr. Jalland Chapman, of Grimsby, from plans by Mr. John Johnson, F.R.I.B.A., London. Fronting High-street, and partly visible from the west side of the Market-place, the hall covers half the area of the old bowling-green. The interior arrangement provides stage, ante-rooms, offices, &c., and a main hall that will seat 500. Mr. H. Webster has gratuitously given service by acting as clerk of works. The cost has been £1,200.

During the restoration of Caistor Church, near Peterborough, in 1862, the south porch, which had fallen into a ruined condition, was wholly removed, the doorway blocked with masonry inside, and the old oaken door, with its adornment of richly-designed ironwork (an illustration of which was given in the *Instrumenta Ecclesiastica*) left to a more speedy decay by exposure. This doorway has now been reopened, and a restoration and replacement of the old ironwork upon a new oak door has been accomplished by Mr. James Button, a local builder.

A new Roman Catholic Church is about to be erected in Wheatland-lane, Seacombe. The estimated cost is £5,000, exclusive of the porches, which are to be subsequently added. It will be of Gothic design, built by Mr. John Shaw, of Priory-street, from a design by Mr. Edmund Kirby, architect, Liverpool. The nave walls, of local red sandstone, will be arched with clerestory windows above, with lead glazing. It will accommodate about 800 worshippers.

ELY AND LICHFIELD CATHEDRALS.—BUSINESS PREMISES, FOREGATE-STREET, CHESTER.—A CORNER MIDDLE-CLASS HOUSE AT HAMPSTEAD, ILLUSTRATING PAPER ON "PRACTICAL ARCHITECTURE WITH DETAILED ESTIMATES,"—OLD OAK OVERMANTEL.

## OUR LITHOGRAPHIC ILLUSTRATIONS.

## TWO ENGLISH CATHEDRALS.

THE photographs from which we give these views to-day were exhibited among other masterpieces of the art as applied to architecture, at the Photographic Exhibition recently held at the Crystal Palace, and they form part of a series of similar subjects by Messrs. Poulton and Son, of Taunton-road, Lee, including views of Salisbury, Carlisle, Worcester, and other English cathedrals.

*Ely.*—Of this grand church we have on previous occasions given several drawings, as will be seen by the references given below,\* and of course the leading facts concerning its history are familiar enough to the student. It may be well, however, here to recount some few details for the convenience of the reader. The present illustration shows the great western tower, looking at the church from the south side, with the return wall of the fine Early English entrance "galilee," which was built about 1215, projecting westwards. The two staircase turrets to the front of the picture emphasise the south-west transept, now used as the cathedral baptistery, and the apsidal chapel seen on the east side of this transept is that of St. Catherine, like to which a similar chapel once existed on the north side of the church, when the north-west transept was standing. St. Catherine's chapel was rebuilt in 1845. The West tower was erected between 1174 and 1197, the lower portion being in the Late Norman style; but the work merges into the Transitional Pointed form of building as it reaches the battlements. The crowning feature, which takes an octagonal form on plan, was added about 1380 to 1400, and is consequently in the Decorated style. The height to the top of the turrets is 215ft. Sir Gilbert Scott, who restored the cathedral, gave it as his opinion that this western tower when first finished was covered by a form of timber and leaded spire, which subsequently became frequent in the neighbouring marshlands—a vast, octagonal pyramid, surrounded by four of smaller size, rising from their turrets at its angles. St. Margaret's at Lynn once furnished a similar instance, and such must have terminated the beautiful detached tower at West Walton (see BUILDING NEWS, June 20, 1884), while a spire of like design still remains at St. Mary's, Sutton. All these followed the great Ely type built by Bishop Ridel, or in the next century by Bishop

Northwold. The *tout ensemble* of the grouping of the high-roofed western transepts, with the leaded spires also on their four terminal turrets, must have been most imposing and majestic in character when seen combined with the high roofs of the western porch and the vast spire above on the great western tower. Bishop Eustace, at his own cost, built the galilee, and it is to be specially noted as a remarkably grand example of the Early English style, contemporary with St. Hugh's work at Lincoln or Bishop de Lacy's eastern chapels at Winchester. Again, at St. Alban's, before Lord Grimthorpe's destruction there, John de Cella's western portals were similar specimens of fully-developed detail of corresponding date. The Ely porch is, of course, later in its mouldings than that at Lincoln, and may have been a little more recent than the St. Alban's portals, though the capitals were identical and furnished the most exquisite Early English works which we possessed. Now, thanks to Lord Grimthorpe, Ely is unique. The historical summary of the cathedral may thus be abbreviated:—In 673 the monastery for men and women, married and single, was founded by St. Etheldreda, the queen, who was its first abbess. She was succeeded by her sister Sexburga, whose daughter Ermenilda followed. In 870 the Danes destroyed the monastery, and in 970 the secular clergy, who had returned to Ely, dismissed by Ethelwold, Bishop of Winchester, and reconstructed the monastery for monks only, under the rule of St. Benedict, Brithnoth being the first abbot. In 1071 the abbey was surrendered to William the Conqueror by Abbot Thurstan, and in 1083 the building of the present cathedral was commenced by Abbot Simeon, brother of Walkelin of Winchester. The diocese was erected in 1109, and Hervé le Breton was the first bishop. The nave, transepts, tower, and choir were continued through the 12th century, and the galilee was built early in the 13th. Bishop Northwold erected the presbytery eastward of the choir in 1235, and the Lady-chapel was commenced in 1321. The following year the central tower fell, and then Alan of Walsingham constructed the octagon and lantern over the crossing. Bishop Hotham soon after reconstructed the western portion of the choir. In 1330 Prior Crauden's Chapel and Guest Chamber, now the Deanery, were built, and in 1340 the stalls in the octagon by Alan of Walsingham were done. In 1400 (Ely Porta) the great abbey gate was built by Prior William de Walpol and the octagon, or campanile, of the western tower followed. The cloisters were put up in 1440, and Bishop West's chapel in 1534. In 1541 the abbey was dissolved by Henry VIII., and the last Prior, Robert Stewart, was made the first dean. The octagon and choir were repaired in 1754, and Sir Christopher Wren rebuilt the north-eastern transept in 1699. In 1823 the nave, octagon, lantern, and transepts were coloured at a great cost, and in 1831 a new organ was put into the old case. The modern restoration of the cathedral was commenced in 1845 by Sir Gilbert Scott, and in 1851, '58, '67, and '70 these works were continued. In 1873 the celebration of the Bisex-centenary or twelve hundredth anniversary of the monastery took place.

*Lichfield.*—The days of the Civil War were sad times for this cathedral, which became simply the stronghold of a fortress,

"... When the frantic Brooke  
The fair cathedral spoiled and took;  
Though, thanks to Heaven and good St. Chad,  
A guerdon meet the spoiler had."

Fanatical preachers speedily took possession of the pulpit, and encouraged the soldiers in their work of destruction under Lord Brooke, the fierce zealot who endeavoured to carry out his threat to destroy the cathedral; but happily he was shot by Dumb Dyott, who fired from the spire of the church. Every tomb was ransacked and every monument shattered. The spire was so mutilated that it fell, too, carrying much of the nave and transept roofs with it in 1643. It occupied eight years to restore the fabric, and the church was reconsecrated in 1669. In 1860, Sir Gilbert Scott took the church in hand and completed it. We illustrate the grand west front to-day, viewed from the close, and showing the three spires. For grace of outline and harmony of general design, few churches can compare with this façade, to which Professor Willis assigns the date of 1275. It is throughout Early Decorated in style, and

consists of a centre, in which the great west window is surmounted by a gable, and of flanking towers, with octagonal stair turrets at the north-west and south-west angles. The towers have large pinnacles, from between which rise the spires. The whole front is divided into three main stages. In the lowest are three doorways, the arch of the central one rising to the top of the stage. A rich arcade covers the walls, containing statues, all lately restored or re-erected. The second stage is sub-divided into three rows of arcades, the lowest of which stretches across the front, and retains the original figures, in spite of the Puritan pikes and musketry. The west window divides the two upper arcades and rises into the third stage between the towers, the cross on the crowning gable being level with the parapets below the spires. There are windows in this stage to the towers, and the rest of the walls is covered with rich canopied arcading. The great west window of geometrical form was put in by Sir Gilbert Scott in 1863, the original window having been spoiled by the Round head soldiers. The new glass, by Clayton and Bell, is a memorial to Canon Hutchinson. The broken statues were "restored" in Roman cement in 1820-22. Although nearly all the mouldings and details of the west front were "restored" with composition at the same time as the statues already referred to, the general outline and design of the arcades and canopies have been renovated correctly, and the old work deserves careful attention, of course, for its beauty, although little of the front, unfortunately, has escaped either mutilation or restoration. The two side portals are deeply recessed in three orders, with enriched arch mouldings. The central portal takes the form of a recessed porch; the inner arch is foliated with a rich mass of leafage. The four figures on the sides of the portal are Mary Magdalene, Mary (the mother of James), St. Peter, and St. John. The doors are covered with very rich and elaborate ancient-wrought ironwork, re-fixed under the direction of Sir Gilbert Scott on new woodwork. The central spire was built by Wren for Bishop Hacket after the Reformation. Those flanking the west front are contemporary with the façade (1275).

The following illustrations of Lichfield Cathedral have appeared in our pages:—Plan of precincts (by Rev. E. C. Mackenzie Walcott), Nov. 21, 1879; elevation, west front, Jan. 16, 1886; view from east (sketched by G. H. M. Addison), March 17, 1882; the mortuary chapels, March 9, 1866; and some mouldings at, Aug. 25, 1871.

## BUSINESS PREMISES, FOREGATE-STREET, CHESTER.

THIS drawing illustrates the building which will complete towards the street the improvements being made on the site known as "Cross Gun Court," belonging to the Duke of Westminster. The archway will give access to the block of cottage flats now being erected in the rear, in the place of the old cottages formerly on the site. The flats consist of thirty tenements arranged on three stories in height, each tenement being approached by a staircase common to several tenants. The building now illustrated will contain shops with dwelling-houses, and will be built of brick and terracotta, with tiled-roofs. Messrs. Douglas and Fordham, of Chester, are the architects.

For description see page 36.

## FARLEIGH COURT LODGE—CHIMNEY-PIECE AND OVERMANTEL.

THIS interesting piece of old work is to be seen in the Maidstone Museum, in what is known as the Farleigh Court Lodge (upper room) leading out of the long gallery. The date of the overmantel is probably about 1600, but it is doubtful if it was to be found in the original building. The drawing was exhibited at the exhibition of works in wood, recently held at the Carpenters' Hall, and we are indebted to Mr. Edwin H. Dance for the loan of it.

The Wesleyans of Salisbury have decided to re-seat and make alterations to their chapel at a cost of £1,000 to £1,200, and have appointed Mr. Fred. Bath, F.R.I.B.A., of Crown Chambers, Salisbury, as their architect.

\* Plans: May 16, 1884, and Jan. 16, 1886; west front, Nov. 16, 1887; west tower from south, with college chapel (by J. Donkin), Dec. 23, 1881; the lantern, July 10, 1863; interior of choir, looking east, Dec. 2, 1870; tympanum over south doorway (Prior's entrance), Oct. 23, 1837; bay of nave (measured by E. G. Northy), March 6, 1880; north choir aisle (J. Donkin), Dec. 22, 1882; wall arcading, Lady chapel (Pugin trav. studentship drawings by Leonard Stokes), March 19 and April 2, 1880; Prior Crauden's chapel (Pugin trav. studentship drawings by W. H. Bidlake), March 6th, 1868; and altar cross, Aug. 12, 1887.

## PLUMBERS' FITTINGS AND SANITARY APPLIANCES.

**M**ESSRS. JOHN BOLDING AND SONS, of the Grosvenor Works, South Molton-street, W., have brought out a very comprehensive catalogue of plumbers', engineers', and gasfitters' brasswork and sanitary fittings, that will be found a serviceable manual in architects' and builders' offices. By the aid of a good index, anything necessary in this branch of building can be instantly referred to and the prices found. Thus, take plumbers' brasswork. We have here illustrated and priced every description of valves and washers and wastes, union-joints of every kind and size. The well-known valve closets, known as "Bolding's," possess all the latest arrangements. The "Simplex" self-trapping, overflow-valve closet is already familiar to our readers, and its construction renders the escape of sewer gas into the house impossible. One great merit of this closet is that the box is small and does not allow of the accumulation of foul matter found in larger outlet-valve closets. Another of the forms illustrated combines a slop receiver and urinal, as well as the closet; there are, besides, eight other sorts of Bolding's valve closet—one without overflow arm, and others showing various modifications suggested by experience. The "Argosy" is an arrangement with the trap above floor for situations where it is impossible to fix a trap under the floor. We especially draw the readers' attention to the earthenware closets with Bolding and Sons' siphon cistern, made in one piece of earthenware, with water waste preventing flushing cistern. Of these the "Dolphin" and "Kenon" pedestal closets are particularly effective and cleanly. The earthenware pedestal closets show P-trap, right or left hand, with flanged outlet; the enamelled iron closets are very suitable for schools and hospitals. The "Kenon" hopper closet is useful and cheap for basements. In connection with the closets we note a number of excellent after-flush and water-waste preventing cisterns. Bolding's siphon-flushing cisterns appear to have all the merits of this principle of action; some of them are noiseless. The "Siphon" after-flush waste-preventing cistern is one of the best forms. Numerous other types and apparatus are illustrated.

Wash-up sinks and housemaids' slop sinks are shown, in which Bolding and Sons have introduced various improvements; these latter sinks are made for corners of rooms, fitted up with hinged grates, hot and cold draw-off and flushing cocks, in slate, enamelled (St. Ann's), grained deal, and mahogany, varying in price from a few shillings to several pounds. Lavatories occupy several pages, and show every arrangement, from the "Paragon" cabinet stand in mahogany or walnut, priced at £16 to £20—a useful and ornamental piece of furniture to the plain lavatories for offices and barracks. For each kind a full specification and prices in the different materials are furnished. Baths, garden fittings, pumps of great variety and for various uses, patent traps and bends, gully traps, disconnecting traps of various types—amongst which we must note Bolding's "Disconnecter" for stoneware drains—and other appliances are similarly treated and classified. Gas-fittings, rain-water goods, ventilating caps and terminals are other things included in this universal guide and price-book, which will be found of everyday use to the architect.

## COUNTRY AND SUBURBAN COTTAGES AND VILLAS.\*

**M**R. JAMES W. BOGUE, architect, Edinburgh, has brought out another book on "Cottages and Villas: how to Plan and Build Them," illustrated by thirty-three plates of designs. The introductory chapters contain a few useful remarks on site and aspect, foundations, drainage, walls, roofs, arrangement, expression, and other matters. The author advocates the appointment of an architect as the most economical and judicious course—a suggestion that might seem rather conflicting with the publication of a set of designs, especially as the employment of an architect means leaving in his hands the whole design and supervision of a building; and, of course,

it is expected of an architect that he should be able to prepare for a given site and conditions a better plan and set of elevations than can be found in any published book. If the work is intended to instruct and enlighten those who are about to build their own house, the case is altered. To the latter class Mr. Bogue's handbook is addressed. Full description of the designs follow. These include designs for labourers' cottages in pairs and rows. The sculleries are rather small in one case, and it would have been preferable to have placed the pantry as a projection rather than to break into the scullery, where so much of the labour is done in this class of dwelling. Plate VI. shows a single-cottage plan arranged in a sensible manner, though we do not like the details of chimneys and porch. It would have looked more effective to have brought down the gable roof on one side over the doorway as a protection, and the cost would have been the same. The semi-detached cottages are certainly more picturesque and satisfactory than the straight row; we certainly never can see the advantage to be derived from a row of cottages intended for farm overseers, gardeners, and other tenants of this class where land is plentiful. The design for a detached villa is suggestive and capable of improvement in the elevations. We scarcely see the need, for instance, of the blank gable on the end elevation, nor the useless finials and drops to the gables—features adopted in other designs. The next plan is objectionable in the proximity of w.c. and pantry. Plates XVI., XVIII., XXVI. show square types of plans for families of varying means, the walls of rubble or brick, with dressings of stone. The arrangements combine in small compass all the usual offices. The detached villa, plates XX. and XXI., has a corner inner porch with a peculiarly-shaped entrance-hall, obtained by a partition built round the octagon-ended bay—a rather wasteful arrangement of space; a more patent objection is the position of kitchen in relation to the dining-room, and the distance between it and the dining-room door. Nor do we like an entrance-hall to communicate with a corridor, as in plate 24. Here, too, by a little rearrangement the store-closet could be turned into a useful serving room from the kitchen, which in this and other plans is placed in an undesirable position in relation to the dining-room and entrance. The plans and elevations are neatly printed, and the hints are practical.

## CHIPS.

A new highway bridge has just been commenced at Appleby; it will cost about £3,700, and is being built from designs by and under the supervision of Mr. J. Bintley, the county surveyor of Westmoreland.

Miss Margaret Thomas has executed in marble a portrait bust of the late Dr. Wilson Fox for the Shire Hall of Taunton, in which Miss Thomas's bust of Fielding already occupies a niche.

Foundation stones of a Wesleyan school chapel were laid at Eastleigh, near Southampton, on Monday. Mr. Stagg, of Eastleigh, is the contractor.

The members of the Caradoc Field Club had an excursion on Tuesday week from Church Stretton to Rushbury, where a tumulus was inspected, to the Church and Castle at Holgate, and to the Early Norman chapel at Heath.

The foundation-stone of a mission hall, to be erected in Mayfields, Westminster-road, Liverpool, and to be called Kirkdale New (Welsh) Church, was laid on Saturday. The mission hall will consist of a room 47ft. by 25ft., connected with which will be two classrooms, which can be converted into one room. The internal fittings are to be of pitch-pine. The style adopted is Gothic, the whole to be carried out in local grey brick, with red brick dressings. Messrs. J. and G. Chappell, Walton, are the contractors for the work, which will be superintended by the architect, Mr. Richard Owens, of Westminster-chambers, Liverpool.

Captain Seddon Wildeblood, of Alsager, has been appointed art master to the School of Art at Crewe, which it is proposed to convert into a school of National art, under the South Kensington rules.

Corner stones for the new chancel about to be added to Lofthouse Church, Yorkshire, at a cost of £1,130, were laid on Saturday. The addition will be Early English in style, and will be carried out from designs by Mr. W. Watson, of Wakefield. The church itself was built fifty years since.

## Building Intelligence.

**FENTON, STAFFS.**—The town of Fenton will soon have the advantage of a suite of public buildings, through the public spirit of Mr. W. M. Baker, of Hasfield Court, Gloucestershire, who will bear the whole of the cost of the new buildings and proposes to let the premises required for the public service at a reasonable rental. In conjunction with this scheme extensive improvements are being carried on, a large square and new streets being in process of formation. The square opens out of Church-street, the Public Hall forming the eastern side, and out of this square, at either end of the Public Hall, is a street in process of formation, running up to another new street, which lies parallel to Church-street, and runs from Fountain-square direct to the railway station. The buildings in course of erection comprise a central block containing magistrates' court and private room, Board and committee rooms, clerks' and surveyor's offices, and over these a public hall, 84ft. long and 42ft. wide. Wings to the right and left of main block contain committee-room, rate collector's, and other offices. The buildings are to be constructed principally of brick, with stone freely used as dressings, and surmounting the central block there will rise a fleche, rising to a height of 125ft. from the ground. The architects are Messrs. R. Scrivener and Sons, of Hanley, and the builder is Mr. William Collis, of Longton. The contract involves an expenditure of about £6,000. The ceremony of laying the foundation stone of the new hall took place on Thursday, the 5th inst.

**LEEDS.**—Pygmalion House, Boar-lane, Leeds, has just been modernised and enlarged under the superintendence of Mr. William Bakewell, architect, of Leeds. The contract was let in March to Messrs. Curtis and Son, and the stone piers, with their arches carrying the superincumbent load, together with the flank wall in Bank-street, were quickly removed and replaced with iron columns and girders, so that within the short space of three weeks the premises were opened to the public for business. The plate-glass frontage, with its polished brasswork, having the armorial bearings of England, Scotland, and Ireland on shields fixed at the three corners, and the red and white roses in the spandrels, has a total length of 90ft. towards Boar-lane and Bank-street, and 15ft. in height. On the ground floor the warehouse is approached from Boar-lane by the grand central entrance. The removal of the old stone staircase, which was a serious obstruction to the business and to the lighting of the warehouse, the re-arrangement of the fittings, and the new grand staircase 6ft. 6in. wide, with return flight to the right and left, formed of solid American walnut and pitch-pine, placed at the end of the warehouse and leading to the galleries, all combine to make the alterations a success. The total cost of the alterations will be about £2,000.

The Sleddall Victoria Jubilee Almshouses and Mission Church, Kendal, have just been formally opened. The donor, Mr. John Sleddall, left nearly £30,000 for necessitous inhabitants of the borough of Kendal, and about £15,000 has been expended in the building and endowment of the almshouses and church. There are twelve houses for aged couples, and at the end of the block stands a neat little church built in the 13th-century style, which will accommodate about 100 persons. The designs have been made by, and the work carried out under, the personal supervision of Mr. Eli Cox, architect, Kendal.

On the 28th ult. the formal ceremony took place of presenting to the city of Peterborough the recent addition made to the recreation-ground and the memorial fountain, being the local jubilee commemoration. The fountain is of polished granite, standing on the north side of the recreation-ground. It was designed by Mr. H. M. Townsend, architect, and the work has been carried out by Mr. Dickens, stonemason, and Mr. Andrew, plumber.

The trustees of the Bablake Boys' School, Coventry, have appointed Messrs. John Giles, Gough, and Trollope their architects to carry out these schools.

The plans for the new Wesleyan Chapel, Penryn, Cornwall, prepared by Mr. J. W. Trounson, Penzance, have been selected, and the work will be proceeded with forthwith.

# Engineering Notes.

**OXFORD.**—A new foot-bridge, erected for public access to the new public recreation ground acquired by the Bedford Corporation on the south side of the river, was opened on Tuesday last, July 11th, by the Marquess of Epsom. The bridge consists of two light-iron segmental ribs, 100ft. clear span and 12ft. deep, from which is suspended the footway by 12 in. diameter. The footway is of cast-iron laid on corrugated flooring 12 in. deep, 12 in. pitch, and 1 in. thick. The offset of the main ribs is 25ft. above the line at the centre of the river, and the curved footway 15ft., both springing from the river bank so as not to impede the along the ornamental gardens on the side. The main ribs each consist of four angle-irons 4 in. by 3 in. by 1/2 in., braced together by flat bars 3 in. by 1/2 in. and by 1/2 in. An ornamental handrailing is added to the suspension rods on each side. Total weight of ironwork, including flooring, ornamental posts, bolts, &c., was under 10 tons. The engineer for the work is Mr. J. Webster, M.Inst.C.E., of 25, Lord-street, London, who also designed the large iron bridge for the Bedford Corporation, which was opened three years ago.

**BUXTON AND HINDLOW RAILWAY.**—This line is to be forthwith constructed. It will be five miles in length. The connection will be at the goods junction of the London and North-Western Railway at Buxton Station, where the rails will be carried over a bridge to be built above the Midland Railway and by a trestle across Spring Gardens to Sylvan Park. Higher Buxton it is proposed to build a new line. The new line will connect with Hindlow, a station on the High Peak Railway, which is a couple of miles from Longnor, a town on the Staffordshire border. The line will be for passenger and goods traffic, and will probably continue the line to Ashbourne and along the valley to Ashbourne.

## CHIPS.

**Belton Church, Rutland,** one of the few remaining examples of the "three-decker" pulpit and reading desk has been replaced by the past week by a pulpit, reading-desk, and lectern, all of pitch-pine. The new furniture has been constructed by Mr. J. Grocock and Mr. Stevenson.

**Souls' Church, Every-street, Manchester,** has reopened, after being decorated by Mr. Bennett, of South King-street, in that city. Additions to St. Thomas's Church, Monmouth, have recently been completed, Mr. F. A. All being the architect. The church is now decorated throughout by means of one of Shorland's underground hot-air stoves fixed under the floor, supplied by Mr. G. H. Shorland, of Manchester and London.

**Thomas Chatfield Clarke, J.P., F.R.I.B.A.,** has been invited to stand as the Liberal candidate for the Isle of Wight at the next election.

**Muckle Cross** which has been presented to the county by Mr. McAndrew, of Romford, a native of Yorkshire, was formally handed over to the county by the town council on Tuesday by the Mayor. The cross is a facsimile of the one presented to Edinburgh by Mr. Gladstone a few years ago and has cost over £300.

**J. W. Trounson, Penzance,** has been appointed the architect for the new Post Office at Penzance, St. Ives, Cornwall.

**Longtown town council** have just completed negotiations with the North Staffordshire Railway Company, and have arranged to pay £1,250 to the company in consideration of their replacing, at an estimated net cost of £2,400, the present obstructive viaduct carrying the railway over the end of Market square by a single-span girder bridge.

**Plans for the addition of a lecture hall, reading rooms, lavatories, and extensive alterations to the old Liverpool Club premises, Mortlake,** were completed last week. The lowest was that of Mr. J. W. Kingston, £1,117. The new buildings will present a front of 42ft. to Worple-road, and will afford accommodation for 500 members. The lecture hall is estimated to hold nearly 300, and the reading room is large enough for three full-sized tables. The architect is Mr. T. C. Barralet, of Chambers, Richmond.

## COMPETITIONS.

**CAMBRIDGE.**—The committee of the Cambridge Town Council have awarded the first premium of 50 guineas to Mr. G. McDonald, A.R.I.B.A., of Arundel-square, London, and the second premium of 25 guineas to Mr. Henry G. Ladson, M.S.A., of Upper Edmonton, N., for the selected designs in the recent open competition for the enlargement of their Guildhall—limit of expenditure, £16,000.

**EDINBURGH.**—THE S.S.C. LIBRARY.—The Council of the Society of Solicitors of the Supreme Court, after considering the reports and information received from their assessors, Messrs. Burnet and Son, have unanimously resolved that in their opinion the plan bearing the motto "Wisdom, Health, and Beauty" is entitled to the first place in the competition, and that the plans bearing the mottoes "Scottish Seventeenth Century" and "S.S.C." are entitled, the former to the first and the latter to the second premium. The author of the plan "Wisdom, Health, and Beauty" is Mr. James B. Dunn, 116, George-street, Edinburgh, the author of the second premiated design for the Edinburgh Public Library buildings. The second design is by Messrs. McArthy and Watson, 137, George-street, and the third is by Mr. G. Washington Browne. The style of the new library buildings, as designed by Mr. Dunn, is a free adaptation of the Scottish Baronial with Tudor features. The architect has placed the library, reading-room, and stores in the topmost and second topmost story of the building. The four lower stories of the building, which are designed as artisans' dwellings, are quite plain. The upper part of the elevation to the Cowgate shows a centre portion with lower side wings—the main building, which contains the library proper, rising to a height of 90ft. above the street. It depends for effect partly on the large bays or oriels, which help to light the library, and the two side wings, and partly on the numerous chimneys, which are a feature in the elevation. The windows have been corbelled out from the wall to the distance of 4ft., and the chimneys have been treated with similar projections. The western corner of the building is finished off with a small hexagonal tower corbelled out from the wall as in the case of the windows. The principal rooms will be in the topmost flat. These consist of a reading-room, the library, and a hall capable of accommodating 200 persons. The access is from Parliament House, and the entrance is in the west corner of the building into a large vestibule, facing which, and occupying the western wing of the building, is the reading-room, measuring 26ft. by 30ft. To the east of the reading-room, occupying the main part of the building, is the library-room, measuring 67ft. by 38ft. It is divided into five bays on either side; and the bookcase blocks, instead of being furniture merely, are treated as part of the architectural design, each block being terminated by a wide pilaster towards the room, these being connected by a series of elliptical arches springing from boldly-designed trusses. The room is lighted from the four sides, this being attained by the side wings being kept low. With regard to the roof-lights, the architect proposes a series of double windows—an outer and an inner—the inner of tinted glass, so as to temper the lighting and prevent draughts. At the east end of the library are the lavatories and the librarian's room. In the eastern wing is the hall, entered from the vestibule by a separate corridor. A stair from the vestibule leads to the flat below, where there are four consulting-rooms, provision for heating, and book stores, which, with the library, will accommodate 70,000 volumes. A fireproof floor separates this flat from the model dwellings beneath. The drainage from the library portion of the building will be entirely separated from that of the tenements beneath, so as to decrease the number of ventilating pipes. A ventilating shaft runs the entire length of the library premises, and the vitiated air will be extracted by a Boyle's air-pump ventilator. At night Strode's ventilating sunlights have been proposed as a help to extracting the vitiated air. The estimated cost of carrying out the design is £13,000.

**WOLVERHAMPTON.**—At Friday's meeting of the Wolverhampton Board of Guardians, the Cottage Homes Committee, appointed to con-

sider the question of erecting cottage homes for the workhouse children, presented their report. It stated that the committee had received 17 sets of plans from local and other architects. The highest of these set down the estimated cost at £40,000, and the lowest put it at £13,040. A sub-committee was appointed to examine the plans, which made the following selection: Mr. G. H. Stanger, estimated cost £14,561; Messrs. Cox and Johnson, £13,897; Mr. Arkell, £13,248; Messrs. Essex and Nicholl, £13,800; Mr. Veall, £13,040; and Messrs. Fleming and Edwards, £15,900. Of these the committee selected the first three for presentation to the Board. They preferred the plans of Mr. G. H. Stanger, and advised their adoption. Mr. T. D. Greensill announced that next week he would propose the acceptance of the committee's recommendation. The Board would then be supplied with the observations of the three architects, and the report of their adviser, Mr. Beck.

## ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

**BIRMINGHAM AND MIDLAND INSTITUTE.**—No fewer than 570 persons took part on Saturday in the ninth annual excursion of this Institute, which had as its destination Worcester and Holt Fleet. A special train conveyed the party from Birmingham, and on reaching Worcester the Rev. Canon Creighton conducted the visitors through the cathedral. The party then embarked on steamers, and started for a trip up the Severn to Holt Fleet. At seven o'clock a party of sixty, led by Mr. Oliver and Mr. Twigg, started to walk through the charming district of Ombersley and Westwood Park to Droitwich, where the return train picked them up. The remainder of the party, after lingering another half-hour at Holt Fleet, returned to Worcester by the steamers in time to catch the train.

**DUNDEE INSTITUTE OF ARCHITECTURE, SCIENCE, AND ART.**—The fifth annual report of this Institute states that the prizes for the past session have been awarded by the referees, Messrs. James G. Orchard and John Kennedy, as follows:—Drawing of Doorway, Dryburgh Abbey, James Burnett, 104, Commercial-street, Dundee; Etching, "Church of St. Maclou, Rouen," R. D. Winter, 26, Overgate, Dundee; Photographs of Buildings, "Modern Buildings of Dundee," Alexander Wilson, 36, Nethergate, Dundee; Modelled Capital, James M. Sheriff, 36, Ronald-street, Glasgow; and paper on "Building Mortar and Cement," J. T. Maclaren, Ferrybank, Cupar Fife. The following gentlemen have been elected as office-bearers for session 1888-9:—President, Thomas Saunders Robertson, architect; vice-president, Charles Ower, A.M.I.C.E.; ordinary members of council, Alexander Hutcheson, F.S.A., architect, and Wm. Mackison, F.R.I.B.A., burgh engineer; associate members of council, Robert Smith, solicitor, William Stephenson, builder; honorary secretary, Leslie Ower, architect, 104, Commercial-street, Dundee; honorary treasurer, J. J. Henderson, architect, 8, Bank-street, Dundee; auditors, G. A. Harris and James Bruce, architects.

**MANCHESTER.**—On Saturday last the members of the Manchester Architectural Association had an excursion to South Wingfield Manor House, Derbyshire. On arriving at Matlock Bath the party were taken in a waggone across the hills, a distance of seven miles, to Wingfield. This once splendid mansion is situated on a hill, and a grand view of the surrounding country of Derbyshire is commanded from the high tower. The building is supposed to have been erected by Ralph, Lord Cromwell, in the reign of Henry VI., and the arms of the Cromwell family occur on the battlements of the hall porch. The building is now a mere ruin, but has still some interesting detail left, and the arrangement of various apartments can pretty nearly be made out, the outer court being, no doubt, a farmyard, but the farm buildings are nearly all destroyed. In the inner court the buildings are more perfect, especially the hall with its porch. At one end of the hall is a fine bay window, the tracery of which is all complete, as well as the richly-panelled stone ceiling over bay. At the other end of hall are placed the offices and kitchens. Over the offices was no doubt the chapel,

though it is now called the "State apartment." The traceried window in this part is, most certainly, the richest in the house, with a good crocketed hood-mould. Under the hall is a range of vaulted cellars, which is called the "Crypt," but is really the wine-cellars. In the centre of each bay of the vault is a round, flat boss, with a wheel-like panelling encircling same. The ribs are massive, and the central pillars short and thick, with plain impost. On the western side of the inner court are remains of a range of Elizabethan buildings, in which Mary, Queen of Scots, is said to have been imprisoned. The members of the Association found ample material for making measured drawings and water-colour sketches of various parts.

**SOUTH WALES SKETCHING CLUB.**—The members of the South Wales Sketching Club and Art Society held a meeting on Tuesday week at their rooms, at 8, Working-street, Cardiff, Mr. T. H. Thomas, R.C.A., presiding. The hon. secretary (Mr. J. A. Sant) reported that a number of sketching groups had been held during the past few weeks, and that several meetings for drawing from models had taken place. Mr. Edwin Seward, the vice-chairman, informed the meeting that Lord Windsor, president of the society, had invited the members to St. Fagan's Castle, when an address will be delivered by Mr. W. Severn. Arrangements for holding a public exhibition at Cardiff in September were then discussed, and referred to a committee to report thereon.

### CHIPS.

A museum of Biblical antiquities has been formed in the office of the Church of England Sunday Schools Institute in Serjeant's Inn, Fleet-street, E.C., which is open free to the public every day.

At Trinity Congregational Church, Reading, which has recently been enlarged and improved, the first section of a scheme for fitting the windows with stained glass has been completed. Four of the six aisle windows and the large triplet windows have been filled, the subjects being:—"The Adoration of the Magi," "The Sermon on the Mount," "Christ Blessing the Children," "The Crucifixion," and "The Resurrection."

On Saturday Mr. S. H. Terry attended the Public-buildings, Soho-road, for the purpose of inquiring into the proposal of the Handsworth local board to borrow £5,000 for blue brick paving, asphalt, kerbing, and other street improvements and for the purchase of a steam roller.

A new theatre has been erected at Nelson, and special attention has been paid to the ventilation, Robert Boyle and Son's latest improved patent self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

At Bury St. Edmunds Assizes, before Baron Pollock on Wednesday, an action was brought against Mr. W. Salmond, town clerk, for an alleged illegal acceptance of 500 guineas beyond his regular salary and allowances, in payment for services said to be outside his agreed duties, in connection with the new sewerage works. The judge held that the Corporation had a right to make the payment, and gave judgment for the defendant with costs, but stayed execution to allow of an appeal.

Mr. Thomas C. Coulthurst, for the past nine years borough Surveyor of Derby, and previously an architect in practice at Barrow-in-Furness, died last week of paralysis at an advanced age. The funeral took place on Wednesday last, and was attended by the Mayor and Corporation, and the official representatives of the Freemasons and other bodies, and numerous private friends.

The new dispensary at Castle Green, Bristol, was opened on Tuesday. It has been built from designs by Mr. W. V. Gough, of Bridge-street, Bristol, and is faced with salmon-coloured bricks with buff terracotta dressings. The building is entirely heated by gas stoves on a new system which warms and ventilates at the same time. The contractor for the work has been Mr. C. A. Hayes, Commercial-road; and the stained glass was supplied by Messrs. Bell and Son, of College Green, Bristol. The dispensary was illustrated in the BUILDING NEWS for Jan. 28, 1887.

Operations have now commenced at Manchester Cathedral, under the direction of the cathedral architect (Mr. J. S. Crowther), for araising what is known as Brown's Chapel—forming the south-west side of the nave. The work will be completed by the beginning of September. The Gordon memorial window in the Ducie Chapel, on the north side of the nave, will be placed there before the meeting of the Church Congress.

### TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASMORE EDWARDS.

### TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.). To India (via Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

### ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

### SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after.

All Situation Advertisements must be prepaid. Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

### NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX, XL, XLI, XLIV, XLV, XLVI, XLVII, XLVIII, XLIX, L, LI, LII, LIII, and LIV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—G. T. K.—H. and R.—C. and Co.—A. W.—K. and Co.—H. S. R. and Co.—A. E. Co.—B. S. and Co.—D. and H. W. W.—H. M. and Son.—W. H. H.

W. C. B. (Although it is desirable that offsets should be less than, or seldom exceed, a chain, in practice it is sometimes impossible to follow the precept. Some surveyors say 50 links is long enough.)

## Correspondence.

### STRAINS.

To the Editor of the BUILDING NEWS.

SIR,—In the article upon this subject which appeared in your issue of the 6th inst. half of

Fig. 6 was, by some mishap, omitted. It consisted of a sketch of a girder with funicular

polygon, to which the polar diagram (which was printed) was reciprocal, line 1 being parallel to line 1 on the diagram; line 2 to line 2, and so on. As either half of the diagram would be utterly unintelligible without the other, and as in future articles this simple method of ascertaining the reactions of supports will be much used, I should esteem it a favour if you would insert this correction in your next issue.—I am, &c., G. A. T. MIDDLETON.

### ARCHITECTURAL WELSHERS.

SIR,—The following letter is, I think, worth publishing. I have, of course, declined the assistance of the Welshman.—I am, &c., C. P. E.

### [COPY.]

SIR,—There is a large competitive meeting held in Wales once a year, in which prizes for various subjects are offered. Among the list this year I find a prize of £5 is offered for the best interior isometrical view of an entrance hall with staircase, the selected design to be the property of the committee. The subject is limited to Welshmen.

If you would care to compete I would take it in my own name, providing you give me £1 out of the £5 if successful. This can easily be done.

The drawing has to be in hand by the 21st of this month. Kindly let me hear as early as you can.—I am, Sir, yours truly,

### PORTLAND STONE AND BATH STONE.

SIR,—In your "Wayside Notes" contained in your issue of 6th inst. I venture to think you have rather strained your remarks in your endeavour to make amends to the Bath stone firms for your remarks in your leader of 22nd ult., by stating Bath stone "is without a rival as a constructional material," and it might probably be therefore a detriment to Portland stone, which claims to be, and, I think, is, "without a rival."

You cite two important and fine buildings (the latter of which I admired, and alluded to the weathering of the stone only recently) built twenty and thirty years since respectively; but cannot we (Portland stone merchants) produce evidence in the shape of fine buildings of two and three centuries' standing, and which will evidently still withstand the test of many centuries to come?

Trusting you will kindly rectify this in your next,—I am, &c., Isle of Portland. F. J. BARNES.

[We had no intention of reflecting on the merits of Portland stone or any other building material, and hope all stone merchants' goods are not so soft as their sensibilities seem to be. Our expression, "without a rival," must of course be read with the context. There are some uses for which lath-and-plaster "is without a rival"; but no one would pronounce it generally the superior of stone. Our note last week was simply intended to remove any unfair impression it seemed to us, on reading our own words in print, might have been left on the mind of any reader, and not in any way to reflect on or raise comparisons with any other material.—ED.]

The ceremony of laying the foundation-stone of new schools for the parish of St. Bartholomew the Great, West Smithfield, was performed on Friday afternoon by the Duchess of Albany. The new building is intended to provide accommodation for 120 boys, 100 girls, and 100 infants, in addition to night-schools and evening classes for the poor in habitants of the parish, and the estimated cost is £2,160. Mr. Aston Webb is the architect. The site is the vacant land south of the building which up to the time of Henry VIII. formed the Lad chapel of the Priory Church, and was possibly the burial-ground of the Canons. It was purchased in 1834 by the Restoration Committee. The boys' school is at present held in the north triforium of the church, and the girls' school in an adjoining building, both of which have been pronounced by the Government inspectors unsuitable for the purpose.

The fourteenth annual conference of the Sanitary Association of Scotland was held in the Corporation Galleries, Glasgow, on Thursday and Friday last, with a large attendance of members. Dr. John C. McVail, medical officer of health for Kilmarnock, president of the Association, devoted his address to a discussion of the methods of preventive medicine.

The corporation of Liverpool voted last week 100 guineas to Mr. T. Sheldermine, the corporation surveyor, and 60 guineas to Mr. Dunscomb, civil engineer, for their services in connection with the inspection of the theatres.

## Intercommunication.

### QUESTIONS.

[9682.]—**Strains in Floors.**—How do you calculate the strength of a floor formed by several layers of boards nailed one on the top of the other—the first layer to be nailed at an angle of  $45^\circ$  to the joists, the second at right angles to the first, and the third at right angles to the second? In the following figure, what would be the

breaking weight at the weakest point, and what formula would it be worked by?—X. Y. Z.

[9683.]—**Rusty Stove.**—Can any reader inform me what to put in a stove in a chapel to keep rust off in a damp situation?—W. WATERS SOUTHERN.

[9684.]—**Free Public Library.**—Would some kind reader inform a student where a good free library can be seen, or where one is illustrated, or whether any books on them are published? Any information regarding fittings would be useful.—M. WEBB.

[9685.]—**Quality of Doors Fixed.**—A joiner having fixed in doors to a new house agreed to be of a certain size, finds, on coming to hang same, that they are too narrow for the frames, consequently fixes slips  $\frac{1}{4}$  in. to 1 in. broad along same to make up size of doors to suit openings, and considers this workmanlike, but the proprietor does not. Is the latter justified in refusing same and asking that new ones be supplied as substitutes, or an allowance made if first fixed are allowed to remain?—FAIRFAXTON.

[9686.]—**Tall Chimney Shaft.**—In a tall chimney we are building some of the rings of brickwork are specified to be in cement instead of mortar. What advantage is there in this? I notice in Bancroft's practical treatise on "Tall Chimney Construction," there is an example of a waterworks shaft similarly constructed with cement rings at intervals; but the author does not give any opinion as to the advisability of so building.—DON.

### REPLIES.

[9676.]—**Dry Rot or What?**—Certainly you are confronted with dry rot, and nothing else; but don't be in a hurry to adopt the wholesale clearing-out process so strongly advocated by many men. I believe dry rot in a piece of timber can be as effectually killed as any disease which takes hold of the human frame. Be lavish with your ventilation, and do not rest content until you are satisfied by experiment that a current of air is passing under every part of the floor. Without this, any amount of cutting away will be in vain, while if this be ensured I feel confident that only that woodwork need be removed which is so far decayed as to be unfit for its purpose. In support of this opinion, I would refer "J. H." to my letter on the subject in the "B. N." of the 9th of March last, and I should be pleased to show him what was done in the instance mentioned therein.—ARTHUR CROW, 35, Queen Victoria-street, E.C.

### CHIPS.

A mansion which has been in progress at Coombe, near Shaftesbury, since the spring of 1885, has just been completed. The house is built of green sandstone, and is fitted up throughout the main wing with high-class joinery of oak and teak. A massive oaken staircase with carved balustrade and newels adorns the great hall. The house is heated throughout by hot water, and lighted by the Electric Light Company. Mr. E. Lowry Whyte, of 81, Charing-cross, is the architect, and the contractor was Mr. W. Dart, Crediton, Devon, who performed the work to such satisfaction that the owner, Mr. Mark Hanbury Beaufoy, presented him, on its completion, with a massive silver punch-bowl with a suitable inscription. Although the cost of this mansion and stables has been nearly £20,000, no clerk of works has been employed throughout, the duties being respectively fulfilled by Mr. W. J. Dart for the house, and Mr. S. B. Francis has been Mr. Dart's representative for the erection of the stables.

One of the smallest Devonshire parish churches, at Horwood, N. Devon, is to be restored from designs of Messrs. Hayward and Son, architects, Exeter. Mr. W. Dart, Crediton, is intrusted with the work.

On Friday a Local Government Board inquiry was held at the Town Hall, Margate, before Mr. Arnold Taylor, local Government board inspector, relative to an application by the town council to borrow £10,000 for the Dane Waterworks, and £716 for works of street improvement.

## WATER SUPPLY AND SANITARY MATTERS.

SANDBACH.—Mr. S. J. Smith, an inspector under the Local Government Board, held an inquiry at Sandbach on Wednesday week, respecting applications made by the Sandbach Local Board for sanction to borrow £7,500 for works of water supply, and £4,000 for building a market house. Mr. Bowers, architect, produced and explained the plans for the market house, and said £4,000 would cover all the proposed expenditure. There was no opposition. The chairman of the Board explained the water scheme and the proposal to build pumping works at Taxmere, about a mile from the town. The estimated cost of that scheme, devised by Mr. Wyatt, C.E., was £7,500.

THIRLMERE WATERWORKS.—The members of the Manchester City Council visited Thirlmere and a portion of the line of aqueduct on Thursday and Friday. The present area of Thirlmere is 328½ acres. If it is raised 50ft., as sanctioned by Parliament, the area will be increased to 793 acres, and the capacity to 8,130,686,693 gallons. It is, however, in contemplation at present to raise the level only 30ft. In the pipe-laying there is 13½ miles of tunnelling, 37 miles of cut-and-cover, and 44 miles of siphon pipes, the total length from Thirlmere to Prestwich being 95½ miles. At Straining Well, the commencement of Dunmail Raise tunnel, explanations of the work were given, after which the shaft at Wythburn was inspected, and the south end of Dunmail Raise tunnel. On Friday the party left Grasmere for White Moss, and examined the work there. After the inspection of Nab Scar tunnel and the cut-and-cover portion of the aqueduct in Rydal Park, the drive being continued to Moor Howe tunnel, Troutbeck, examining the line of siphon pipes which cross the valley. After this the south end of Moor Howe tunnel was inspected, and the drive taken forward to Kendal, where the inspection ended. Contract No. 5, which will bring the aqueduct nearly as far south as Lancaster, will be let this month. The tunnelling on this section will be about a mile and three-fifths; the rest of the work will be "cut-and-cover." The section begins at a point three miles east of Milnthorpe station, and terminates three and a-half miles to the south-east of Lancaster.

## STATUES, MEMORIALS, &c.

EXETER.—A strong feeling having been manifested that a memorial of some kind should be placed in the Exeter Cemetery to mark the graves of the 200 victims of the theatre fire, the Fire Relief Committee recently advertised for designs and tenders from sculptors and statuary for a suitable monument. At their meeting on Friday evening, the recommendation of their subcommittee that the design of Mr. Harry Hems, sculptor, of Exeter, be accepted was adopted. Mr. Hems's design consists of a monolith of black Ballinasloe marble, 14ft. high, upon a plain base of grey Devonshire granite. The form assumed is that of a plain Celtic cross, and upon the circle that occurs at the junction of the arms and shaft of the cross will be carved in raised letters on one side "In memoriam," and on the reverse, "5th September, A.D. 1887." The cross will be placed on the spot where the unidentified remains are buried.

New waterworks were inaugurated at Howden in the East Riding on Monday week. Mr. Fairbank, of Driffield, is the engineer, and the contractors have been as follows:—Well and boring, Mr. J. Villers, Beverley; pipes, laying, and softening machinery, Mr. T. Bell, Market Weighton; pumping machinery, Messrs. Haley Brothers, Bramley, near Leeds.

The foundation-stone of the new workhouse for Gateshead was laid on Tuesday. The building, which will cost between £46,000 and £47,000, is being erected by Mr. Walter Scott, of Newcastle, from plans by Messrs. J. H. Morton, of South Shields, W. L. Newcombe, of Newcastle, and W. H. Knowles, of Gateshead. Mr. Caris is the clerk of works. Accommodation will be provided for a thousand inmates.

St. Andrew's Church, Monkton Wyld, now possesses a complete rood. The chancel screen has been entirely transformed by the addition of images and cresting on the beam, together with enrichments to the tracery and panels below. The rood rises to the height of about 8ft. above the doorway in the centre of the screen from a band of tracery which connects the pedestals for SS. Mary and John. Beyond these are kneeling figures of angels, vested as acolytes, and bearing rich candlesticks of gilt copper; while the extremities of the beam are occupied by six winged seraphim. The architects were Messrs. H. A. Hudson and F. C. Eden, and the makers Messrs. Luscombe, of Exeter.

Messrs. Robertson and Patley, of Long Acre, surveyors, have dissolved partnership.

## LEGAL INTELLIGENCE.

ILLICIT COMMISSIONS AT GASWORKS.—Samuel Hunter, who was manager of the Salford Corporation Gasworks, pleaded guilty at the Central Criminal Court in March to charges of perjury and embezzlement. He had defrauded his employers in connection with contracts for the purchase of coal by secretly accepting commissions from the contractors. He had also brought an action for libel against Mr. Ellis Lever, who made known his misconduct and defalcations. Mr. Justice Hawkins sentenced him on Friday to five years' penal servitude for perjury, and to concurrent terms of one year's imprisonment on two other charges, the sentences to date from March last.

THE CONDITION OF GLOUCESTER CATHEDRAL.—Mr. Justice Chitty delivered judgment in reference to an application by the Dean and Chapter of Gloucester for a grant of £1000 for repairs to the cathedral out of a trust fund known as the Wharfedale Ecclesiastical Charity. It appeared that the fund was established in 1855 for the repair of churches in the ancient diocese of Gloucester, and consisted of some £30,000. In consequence of the depreciation of land from agricultural depression, the income of the chapter had been reduced by 40 per cent., and whilst every day the repairs of the cathedral were becoming more and more urgent, the chapter's position to provide for them was becoming worse and worse. There was an urgent need for immediate outlay, as portions of the cathedral were, according to the architect's report, positively perishing. The Dean and Chapter under the circumstances applied to the petitioners for a grant of £1,000, to be chiefly expended on structural repairs, but in some small part in providing seats for the poor. Mr. Justice Chitty said that he was unable to advise the petitioners that the grant asked for would fall within the scope of their trust. It was impossible to suppose anything else except that the foundress of the charity had intentionally excluded the cathedral from her benefits. But on the other hand, had the foundress been able to foresee in 1855 the state of things in 1888, she would have said "the cathedral, of course, is of all other churches that which I most care for," and would have expressly comprised it in the trust.

## PARLIAMENTARY NOTES.

THE FADING OF WATER COLOURS.—In answer to Sir A. Borthwick, Mr. Jackson said, on Monday night: The Committee of Artists have expressed their opinion on the report of the scientific investigation into the action of light on water-colours by Dr. Russell and Captain Abney. The report, with the opinion of the Committee of Artists, has been laid on the table of the House, and will, I hope, be in the hands of members in a few days. No special precautions—other than those which are always used—have been taken to protect these drawings pending the result of the inquiry.

### CHIPS.

The memorial statue of the late Bishop Moberley in the Lady Chapel of Salisbury Cathedral was unveiled on Monday. The figure, which is of white alabaster, is in a recumbent position, the hands in an attitude of prayer, and the pastoral staff is at the side. At the head and feet are figures of angels in a kneeling position, and above are four alabaster medallions representing events in the life of the deceased prelate.

Strawberry Hill Estate, which, in consequence of the death of Baron de Stern, has again come into the market, failed to attract a purchaser at Wednesday's sale, the highest bid being £15,000, whereas the reserve was about five times that amount. The collection of art furniture, pictures, and ornaments will shortly be sold on the premises.

By the will of the late Hugh Robert Rump a sum of over £2,000 has been left to the parish church of Wells-next-the-Sea, which was struck by lightning and almost burned to the ground on August 3, 1879, and has since been restored from plans by Mr. Herbert J. Green, of Norwich. The will directs that the money shall be expended in the providing and fixing a peal of eight bells, a new organ, new oak benches, &c.

A Committee of the House of Lords passed on Tuesday the Bill promoted by the London Tramways Company, which authorises that company to extend their system from Clapham to Tooting. The proposed tramway will be a double line throughout.

The first sod of the Victoria Infirmary at Lingside, Glasgow, was cut on Friday last. The infirmary will adjoin the Lingside Established Church, and will cost about £50,000. Messrs. Campbell, Douglas, and Sellars, of Edinburgh, are the architects.

## Our Office Table.

THE annual report of the director of the National Gallery to the Treasury for the year 1887 states that six pictures were purchased during that period—viz., "The Holy Family," by Marcello Venusti, purchased out of the Lewis Fund; "The Blood of the Redeemer," by Giovanni Bellini, and "A Muse Inspiring a Court Poet" (?), by Dosso Dossi, purchased out of the Walker Bequest; portrait of a girl, by Domenico del Ghirlandajo; portrait of a man, by Sir Antonio Mor; and portrait of a man, by Heinrich Aldegrever, purchased out of the Walker Bequest. The bequests and donations to the Gallery, eight in number, included "A Distinguished Member of the Humane Society," by Sir Edwin Landseer, bequeathed by Mr. Newman Smith; "Portrait of Sir Samuel Romilly," by Sir T. Lawrence, bequeathed by Mr. Charles Rosilly; "Titania and Bottom," by Henry Fuseli, R.A., presented by Miss Julia Carrick Moore; and "View of the house in which the artist was born," by John Constable, R.A., presented by Miss Isabel Constable. The trustees and director urge on the Government the advisability of further extension of the building. The trustees and director have renewed their application to the Lords Commissioners of Her Majesty's Treasury, urging them to reconsider the question of restoring the annual Parliamentary grant for the purchase of pictures (suspended since 1885), and suggesting that at least the yearly sum paid by the public for admission on students' days (estimated at £1,200), as well as the profits derived from the sale of catalogues, might be placed at the disposal of the trustees for this purpose. Their lordships were unable to accede to this request; but they sanctioned an advance of £2,000 for the purchase of pictures in 1887-88, should an opportunity occur of expending that sum with advantage to the Gallery.

THE pressure of public opinion evoked by Sir William Gregory's recent letter appears, however, to have induced the Lords of the Treasury to relax the purse-strings a little during the past week, for several valuable additions, chiefly portraits, to the National collections have been acquired at prices which will not be regarded as extravagant. For the National Gallery has been purchased, at the Quiddendam House Sale, Reynolds's portrait of Lady Anne Lennox, daughter of the Duke of Richmond, and wife of William, second Earl of Albemarle—the work enlivened for its quality and preservation, for Leslie, in his "Life of Sir Joshua Reynolds." The National Portrait Gallery at Bethnal-green has obtained from the collection of Earl Hardwicke a portrait of Lord Justice Parker, afterwards Lord Macclesfield, by Kneller; another representing the interior of the Court of Chancery in that Lord Chancellor's time, and crowded with portraits of the most distinguished advocates of that day; and a third of Charles Montague, first Earl Halifax. The Trustees of the Irish National Gallery at Dublin have received a portrait of John, first Earl of Clare, Lord Chancellor of Ireland at the time of the Union.

THE Works Committee have reported to the Metropolitan Board of Works in compliance with a resolution of the Board of the 6th inst., that Mr. E. Stimson, Mr. Robert Reid, and Mr. Matthew Miles, auctioneers employed by the Board, having admitted that they have given money to officers of the Board, in connection with the Board's work, the Committee have withdrawn from the hands of Mr. Stimson and Mr. Reid instructions which had recently been given to them to submit to auction properties belonging to the Board, and have decided that none of the three auctioneers above named shall be again employed on behalf of the Board. The report will be considered by the Board to-day (Friday).

A SPECIAL Committee of the London School Board, which has been making some inquiries into the condition of their buildings and works, have submitted the following resolution for adoption by the Board: "That in the opinion of the Board the late architect of the Board is responsible for the absence of proper foundations at the Broad-street School, Ratcliff (Tower Hamlets), and that he be called upon

to make good the loss arising therefrom." The report states that whereas the contract depth of the foundations was 10ft., the depth paid for was 12ft. 8in., 11ft. 9in., and 15ft. 6in. respectively of foundations, which on examination prove to be 7ft. 4in., 7ft. 3in., and 9ft. 9in. The condition of the school in Queen's Head-street, Islington, is also reported to be far from satisfactory.

THE Society of Architects have voted a donation of five guineas to the Draughtsman's Provident Society, and also promised that if draughtsmen support this institution they will give it further liberal help. Mr. Walter Emden has likewise promised a donation of £10, and an annual subscription of £5 for the next five years. We are told that the promoters of the Society have had a hard struggle in overcoming the initial difficulties of the undertaking, but matters have assumed a brighter aspect, and the Society is now on a firm basis. They propose to form an out-of-work fund and register, in addition to the other benefits.

THE new public park which is being laid out at Smethwick for the use of the inhabitants is rapidly approaching completion, and it will be ready for opening towards the middle of August. The park, which will be named "Victoria Park," occupies a situation lying between Bearwood Hill and the Six Ways and Cape Hill portions of the parish. The local board purchased 35½ acres of land formerly known as the Pool Farm estate, having an extensive frontage to Bearwood Hill, at a cost of £7,000. In addition to this, the laying-out of the grounds will entail an additional expenditure of £3,000, bringing up the total estimated cost of the park to £10,000. The whole of the arrangements have been made by the surveyor to the local board, Mr. J. C. Stuart. A boating-pool will be constructed, covering an area of about two and a half acres. About three acres of shrubberies will be distributed over the grounds, which will be supplied by Messrs. Fisher, Son, and Sibbey, of Sheffield. A belt of trees and plants of various kinds will be placed round the park, thereby secluding it altogether from outside view. The means of ingress and egress are numerous. Vases of the value of twenty guineas have been presented by Messrs. H. Doulton and Co.

THE Lancashire and Cheshire Antiquarian Society, anxious to ensure the safety of whatever relics of a past age may be discovered in the course of the Ship Canal excavations, have caused a circular to be printed for distribution among the men, giving illustrations of arrow-heads, stone hammers, axes, &c. They request that anyone discovering stone or bronze implements of this description, ancient pottery, or old coins, or who may make any other discoveries bearing on the ancient inhabitants of the district, will bring them before the notice of the society, and communicate with Mr. E. Leader Williams, C.E., or the society's hon. secretary, Mr. G. C. Yates, of Manchester.

### CHIPS.

The Salford town council has passed a resolution in favour of opening the free libraries on Sundays by 25 votes to 12. A committee had already reported in its favour by eight votes to six, and when a poll was taken a considerable majority of the ratepayers took the same view. The decision of the council was, therefore, a foregone conclusion.

A large clock has just been erected on the church tower at Baconsthorpe, Norfolk, by John Smith and Sons, Midland Clock Works, Derby, which is fitted with all the improvements introduced by this firm. It has one face 5ft. across, and strikes the hours.

The foundation-stone of a new Free Church at West Knockbain was laid on Friday. The church, which will be seated for 500 persons, is designed in the Early English style, and is expected to cost £1,200.

The Dean of Westminster writes to inform American visitors to the Abbey that the monument to Viscount Howe, "slain on the march to Ticonderaga" in 1758, which was erected by a vote of the Province of Massachusetts in the year following, has been removed from the window in the south aisle of the nave, where its inscription was to most eyes undecipherable, and placed on the floor, immediately behind the monument to Fox and just within the belfry.

### MEETINGS FOR THE ENSUING WEEK

**SATURDAY (TO-MORROW).**—Architectural Association. Visit to Layer Marney. Train from Liverpool-street station, 8.50 a.m. Municipal Surveyors' Association. T. by steamboat from Temple Pier 11a, to inspect the Tower Bridge and n. Outfall Works at Barking. **WEDNESDAY.**—Cyprus Exploration Fund. Public meeting in rooms of Society of Antiquaries, Burlington House. Paper on "Excavation of the Temple of Aphrodite at Paphos," by E. Gardner. **THURSDAY.**—Society of Architects. Visit to the London and South-west Subway, 1 p.m. **SATURDAY.**—Glasgow Architectural Association. Afternoon Visit to Bothwell and Neighbourhood.

The memorial to the late Colonel King-Harmer, the first Parliamentary representative of the Isle of Thanet, will take the shape of a statue, the times life-size, to be erected in a prominent position in Margate.

Princess Beatrice laid on Tuesday the memorial stone of new almshouses at Greenwich. They will replace a group of buildings built in 1809 to commemorate the jubilee of George III., and are erected from plans by Mr. T. W. Dinwiddie.

At the last meeting of the Pudsey local board Mr. Nelson, Leeds and Fulneck, was appointed architect for the proposed public park Church-lane, and instructed to prepare plans of lodge and boundary-walls.

**Holloway's Pills.**—The Great Need.—The blood is the life, and on its purity depends our health. These Pills thoroughly cleanse this vital fluid from all contaminations, and that power strengthen and invigorate the whole system, health stimulate sluggish organs, and establish order of circulation a secretion throughout every part of the body.

**Garside's Noted Bedfordshire Coarse or FINE SILVER SAND.**—Is perfectly free from impurity, and is the best and cheapest in the market. All qualities in stock, for every purpose required in the building trade, for filtration, or for nurseries purposes. All pure grit!—Apply to **GEORGE GARSIDE**, Jun. Leighton Buzzard.

**HYATT'S LENS** and "SEMI-PRISM LIGHTS" FOR PAYMENTS, STALLBOARDS, ROOFS, TILE and GLASS LIGHTS in beautiful designs. **THADDE HYATT**, Manufacturer, 9, Farringdon-road, London, E.C.

### DOULTON FREESTONE.

**THE CHELYNCH STONE.**—The Stone from these Quarries is known as the "Weather Beds," and is a very crystalline nature, and is undoubtedly one of the most durable Stones in England.

**THE BRAMBLE DITCH STONE** is of the same crystalline nature as Chelynch Stone, but finer in texture and more suitable for moulded work.

Prices, and every information given, on application to **CHARLES TRASK and SONS**, Doulton, Shepton Mallet, Somerset. Local Agent:—**Mr. E. A. WILLIAMS**, 16, Craven-street, Strand, W.C.

### HAM HILL STONE.

Greater facilities have been provided for working these Quarries and the Stone can be supplied in large quantities at short notice.

Prices and every information given on application to

**THE HAM HILL STONE CO.,**

NORTON, STOKES-UNDER-HAM, SOMERSET.

London Agent:—

**Mr. E. A. WILLIAMS**, 16, Craven-street, Strand, W.C.

### WM. OLIVER & SONS

**MAHOGANY, WAINSCOT, WALNUT TEAK, VENEER, and FANCY WOOD MERCHANTS,**

**120, BUNHILL ROW, LONDON, E.C.**

The most extensive Stock of every kind Wood in Planks and Boards, dry and fit for immediate use.

### TENDERS.

\*.\* Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, if accepted tender: it adds to the value of the information.

**BANGOR CITY.**—For flooring the schools now in course of erection at Glanadad with wood blocks, for the Bangor School Board:—**Elliott, Edmondson, and Olney**, Manchester, 5s. 6d. per yard (Accepted.)

**BOURNEMOUTH.**—For additions to the Herbert Colvaescent Home. **Mr. H. E. Hawker**, Bournemouth, architect:—

Jones ... .. £1,160 0 0

MacWilliam ... .. 1,145 0 0

Jenkins ... .. 1,095 0 0

George and Harding (accepted) ... .. 982 0 0

**BOURNEMOUTH.**—For additions to the Osborne. **Mr. H. E. Hawker**, architect:—

Jenkins and Son (accepted) ... .. £375 0 0

**BROOK GREEN.**—For block of residential flats at Herlem-road, W. Messrs. **Lewen Sharp and Arple**, 3, Dul street, Adelphi, W.C., architects:—

# THE BUILDING NEWS

## AND ENGINEERING JOURNAL.

VOL. LV.—No. 1749.

FRIDAY, JULY 13, 1888.

### CHARGES OF NEGLIGENCE.

A GENERAL impression prevails amongst many practical-minded people that an architect cannot charge anything for preparing plans or estimates for a work that turns out of little practical use, or which has cost more to carry out than is anticipated. Why such an idea should be entertained we cannot imagine, unless it is that the profession have themselves fostered the notion that they are paid for designs on paper, so much actual office labour of a mechanical kind, instead of for their artistic advice and ability in carrying out buildings. The art and scientific knowledge possessed by the architect count for nothing if a flue fails to draw, a kitchener does not cook well, or a drain becomes stopped up. These little defects, mechanical as they are, very seriously discount the value of the architect's services. Unfortunately, too, they are often found to exist in a somewhat unaccountable direct ratio to the external architectural success of the building: in other words, the plain and ugly building is generally the most faultless in internal arrangements of this description; the inference is thereby drawn that architects look after the appearance and increase cost without insuring direct advantages. No doubt there has been some ground for notions of this kind; but are there not other advantages secured by the employment of a professional adviser and supervisor? Is the house not better built, better planned, and the expenditure laid out to better advantage? We appeal to the experience of those who have built. There will always be people who affect to undervalue architects' work, as they prefer to be thought their own lawyers and doctors. No immediate benefits may accrue from an architect's skill; often his art and science are "unknown quantities"; but they are nevertheless appreciated by people of taste and judgment.

Negligence and want of skill are often pleaded by clients and committees without so much as a shadow of reason. What constitutes negligence and want of skill? This is a poser to the employer. It may be considered negligence on the part of an architect if, through not having examined every part of a foundation, a portion of it gives way; if bad materials are introduced in his absence; if a skating-rink floor sinks in parts, and it cannot be used. Nevertheless, these are matters which so essentially belong to the builder's duties that it would not be easy to say which of the two is liable. As the duties of the architect are now performed, it would be quite impossible for him to superintend those things in every work in which he was engaged; the legal decisions that have been given impose only a general superintendence of the work. It has been also ruled that the highest skill cannot be demanded, only that ordinary degree of skill and knowledge which is reasonably expected from an architect. There is one test which the law appears to have laid down touching the architect's claim to recover payment. The work done must be of some use or benefit to the employer. If he derives no benefit from the work, the architect cannot recover his charges. Let us suppose a house incomplete by reason of some alleged fault in its design. One thing by which we may know whether the employer derives any benefit from it is occupation. If he goes and lives in the house, notwithstanding its alleged im-

perfection, it may be concluded that the owner can make use of it, and therefore he has received some value. Were it otherwise, any employer could turn round and say, "The building is not what I wanted; I cannot think of paying you for your services." We all know the dissatisfaction of some employers—nothing pleases them after the accounts are delivered. To the jury is generally left the question what is a "reasonable degree of care and skill." How very differently must these terms be construed! An ordinary degree of care must be relative. To a busy or eminent architect it may mean a glance once a month; to a small country practitioner a daily inspection; so of skill—it may mean very different things in the minds of differently-constituted juries.

As to want of skill, we may take one of the everyday cases where an architect's knowledge is called into requisition. A manufacturer or tradesman engages an architect to prepare plans for business premises. Plans are accordingly prepared, but in ignorance of the rights of the client's adjoining neighbours as to light. The building is finished, but the neighbour complains of the loss of light which he has suffered, a right of light that has been enjoyed over the prescriptive period. An action for damages is sustained, and the building owner becomes liable for damages—is the architect to be held responsible? The question has not yet been satisfactorily settled. Is the ordinary skill which the architect is supposed to bring to his duties to include a knowledge of law as applied to easements? In these days of advanced knowledge it may be presumed that it does. An architect who does not know the easements of light and support cannot safely be entrusted with the planning of buildings for business purposes in a crowded site. But it has been assumed that an architect is not supposed to be acquainted with the private rights of his clients or his neighbours, and, therefore, if an owner becomes liable, he would not have any remedy against the architect in the usual course. We are doubtful if any jury would now be disposed to act upon this opinion. No doubt it is the business of an intelligent employer to instruct his architect about these rights, which he cannot in all cases be supposed to know; nevertheless, the duty of a responsible professional adviser is to satisfy himself as regards these rights, and to advise his client upon them. Instructions to prepare plans convey the power to make inquiries, and to exercise one's judgment: a very different meaning would attach to a commission to an architect to prepare a design from verbal instructions only. Any error committed would in this instance clearly be the fault of the employer, and it should be the architect's duty to make the designs subject to the owner's taking any liability as to instructions that were given him.

Of course, parties can contract in any manner they desire. If an owner desires to make the architect liable for, say, omission or want of skill, he can do so, providing the architect is a consenting party; but we are now speaking of the ordinary course, in which no special obligations are undertaken by the architect.

A legal tribunal would hold an architect liable for any ignorance or carelessness by which his client suffers, the damages recoverable being the loss or damage that has been sustained. An owner would, for instance, have a remedy against the architect for any failure—such as a roof giving way, or a column breaking owing to unskilful design—where the failure can be plainly traced to insufficient scantlings or bad construction; but if there is no apparent defect in the design, the failure having occurred through unskilful workmanship or materials, over which the architect could not be supposed to exercise constant control, the contractor

is certainly the liable party. In France and other countries the question of negligence has been more clearly defined. The architect is held responsible for not watching over the work, for allowing a defective foundation, or permitting the use of improper or insufficient materials, or for neglecting to observe the laws and regulations, or servitudes and agreements, connected with building and client; but the consequences fall only on him when the client has suffered damage. Both architect and contractor are held liable for unskilfully-directed and badly-executed works. We are not treating here of the responsibility of the architect, but of his right to payment when a charge of negligence has been made against him. The making of estimates is attended with this risk. An estimate is prepared for a building which is found considerably below the real cost owing to some omission on the part of the architect; the owner refuses to pay, and it is very doubtful if the former can recover anything for the plans. Such a case is of frequent occurrence; an engineer employed to erect a bridge makes an estimate of the cost, which is found incorrect by a large amount: he has not examined the substratum, and his estimate is therefore of little value. But in all such cases it is the duty of the jury to inquire into the circumstances of the work, and if there are found to be difficulties in the way of obtaining a correct estimate, the architect should not be made responsible for the loss.

### WHAT IS A LEASE?

THIS question—What is a lease?—has been asked in hundreds of cases in the courts of law, and it has been answered in many various conflicting and confusing ways. It has generally arisen upon the point whether or not an agreement for a lease did not, in law or in equity, come to the same thing as a lease itself. The broad result of the authorities is that if such an agreement contains words of present demise—that is to say, if the landlord thereby lets, and the tenant takes, the premises mentioned, it must be regarded as a lease for all practical purposes—premising, of course, that it is acted upon by the parties. The Courts of Equity have always been ready to prevent any injustice following from the refusal of a lessor to grant a proper legal lease as he had promised, by ordering specific performance of such an agreement. A new point of much importance upon this question of what is a lease has, however, lately been raised upon the consideration of Section 14 of the Conveyancing and Law of Property Act, 1881. This excellent statute was passed to soften the hardships of the law of landlord and tenant to some extent, and it did a little towards civilising the barbarous system which we have inherited from our ancestors. In the section named it was provided that a right of re-entry or forfeiture under any stipulation in the lease, for breach of any covenant of the lease, shall not be enforceable unless and until the lessor serves upon the lessee a notice specifying the particular breach complained of, requiring the lessee to remedy the breach, if that can be done, or, if not, to make compensation, and the lessee fails within a reasonable time thereafter to remedy the breach or make such compensation. This fair and equitable provision applies to every lease, whether made before or after the Act of 1881, and notwithstanding any stipulation to the contrary. But does the word "lease" we have used include an agreement for a lease which has been acted upon by the parties as if it were an actual lease, and which is enforceable as such accordingly? This was the question raised in the recent case of "Swain v. Ayres and Luck" (*Times*, 13th June), and decided by the Court of Appeal, confirming the Court below in the negative for reasons of a highly tech-

nical, narrow-minded, and, as we consider, of a most unsatisfactory character.

As long ago as July, 1853, the present plaintiff's predecessor in title entered into an agreement with the defendant's predecessor for a lease for eighty years, upon condition that the tenant would lay out £100 upon repairs, and should then be entitled to the lease, and, in the mean time, should hold the premises subject to the usual lessee's covenants to repair, with powers of re-entry and forfeiture upon default. No lease was ever granted, although the tenant did the repairs as arranged, and could, had he chosen, have obtained a lease by means of a decree for specific performance if necessary. This was not done, and the tenant went on paying rent, and holding, under the agreement, down to 1886. Then the plaintiff brought the present action to recover possession of the premises, and claiming a forfeiture on the ground that the defendants had broken their covenant to repair, as the premises were in a very bad state of repair. The defendants' main answer was that they were entitled to the protection provided by Sec. 14 of the Act of 1881, and that, therefore, the plaintiff should first have given them notice of the bad state of repair, and calling upon them to remedy the breach of covenant by putting the premises into proper repair, before he could bring an action upon the forfeiture. Obviously, this argument was based upon the contention that the word "lease" in this section included an agreement for a lease, which in this case had been acted upon by both parties as a lease for 33 years. Mr. Justice Charles, who heard the case in the Queen's Bench Division, decided in favour of a narrow construction of the word "lease" as used in the section quoted, giving it what he called its "natural meaning," as if that had not been lost long ago amongst the definitions of learned lawyers. He held that it was not a lease, but an agreement for a lease, although it contained words of present demise. He admitted that Sir George Jessel—who was, we consider, one of the ablest and most large-minded judges that ever lived—had practically ruled in a leading case that a person who held under an agreement for a lease was in the same position as one who held under an actual lease. But he "distinguished" the cases, and found the facts different, as they always are, and he finally gave judgment for the plaintiff, holding that, though this agreement was a lease from the lessor's point of view, and so appreciable as such, it was not a lease within the meaning of section 14 of the Act of 1881, so as to give the lessee or tenant any protection from the forfeiture incurred.

We regret to say the Court of Appeal took the same narrow view of the question. They held that as the defendants had let the premises fall into a bad state of repair they could not, after doing this, obtain a decree of specific performance of the agreement for a lease, and so obtain the actual lease itself. From that they argued backwards that this agreement for a lease was not therefore the same thing as a lease, although in a general way it would be so considered. Going along the same line back, they held that as the agreement for a lease was not now the equivalent of a lease, it was merely a tenancy, and could not come within the meaning of the clause quoted. This appears to us to be the very perversion of all just and judicial reasoning. It could not be disputed that the tenant could have compelled his landlord to grant him a lease at any time after he had done the repairs as stipulated, and before he broke the covenant to keep the place in repair. Therefore, during the whole of this period the agreement for a lease was admittedly as legally binding as an actual lease. Yet when its effect comes to be considered, although the agreement is held enforceable as a lease by the lessors, it is to be

regarded merely as a tenancy in respect of the lessees, because they have broken a covenant and incurred that forfeiture from which the Act of 1881 was expressly intended to protect all those who held under what is in law or equity a lease! It is certainly very unwise for parties to an agreement of this kind not to take up a proper lease because of its cost, and so make sure of their legal position; and the heavy loss that will be suffered by the defendants in this case may be a warning to others similarly situated. It is equally foolish for tenants or lessees who are bound to repair to let the premises fall into so bad a state by putting off the evil day of expenditure as long as possible. But, apart from all this, we cannot accept the decision of the Court of Appeal as in accordance with the scope and spirit of the Act of 1881, or with the broad and enlightened views laid down by Sir George Jessel from that Bench. We maintain that the question whether this agreement for a lease amounted to a lease within the meaning of the section, should have been considered with reference to the position of the parties under that agreement before there was any breach of covenant, and not afterwards. It is obvious that had this been done, the defendants would have succeeded, and the object of the Act of 1881, in affording relief to lessees, would have been obtained.

#### PRACTICAL ARCHITECTURE, WITH DETAILED ESTIMATES.

By H. LOVEGROVE, F.S.I., Surveyor.

##### INTRODUCTORY.

THE subject of quantity taking has been treated of by several writers. Many books on building generally have sections treating on the subject; but, for the most part, these are mixed up with a variety of other and widely different matter.

Many years since a book called the "Young Surveyor's Preceptor" was published, and later on the articles in this journal, by Mr. Banister Fletcher, which subsequently formed one of a series of volumes on practical surveying.

"Quantity Surveying," by Mr. Leaning, appeared in 1880, a very able work, dealing especially with method, and endeavouring to set forth the best system of preparing quantities, apparently based on the orderly procedure of a much respected member of the profession, Mr. Thomas M. Rickman.

All the above mentioned works take a small portion of a building so as to illustrate the method of taking a typical item in each trade, and laying down rules for abstracting and billing, according to the accepted methods.

Blenkarn's "Specifications" was for many years the only treatise on the subject until the publication of the "Handbook of Specifications" by the amiable and erudite Professor Donaldson, who gave to the world not only his own practical and well-written specifications, but also a large number of typical specifications for important public buildings by some of the leading architects of his time. Later, Mr. F. Rogers published a work based upon Blenkarn's, and including some portions of that work, with more modern specifications, chiefly of ecclesiastical architecture.

The present series was suggested by readers of this journal, and no apology should be needed for my attempt to comply with the request of the Editor to endeavour to lay before the architectural student one method of writing specifications and preparing bills of quantities, with the advantage of first-rate illustrations of comparatively small but complete buildings, adapted for every-day use and ordinary requirements, with details of their construction.

The object of these articles is not to add to the already excessive number of quantity surveyors, but rather to induce architectural students to study details of practical building and the measurement thereof, believing as I do that such knowledge will in the future prove quite as useful as entire devotion to drawing and drawing only.

I have not one word to say against draughtsmanship, as unquestionably good and correct drawings produce good buildings.

It has been my lot to take off from drawings of all degrees of quality, and I confidently affirm that some of the best drawings not only correctly illustrate the intention of the author, but at the same time are thoroughly practical.

Architects fifty years since did not consider it derogatory to master and, if necessary, to practise, the art of measurement of artificers' work; and I have always failed to understand why those members of the profession who have taken up that branch should be locked down upon by some artistic practitioners, while others, whose architectural practice has been more or less confined to the laying out of estates and other branches of surveying, have been treated otherwise, although their art consists chiefly in a superficial smattering of the leading art topics.

The architect of the future must be an all-round man, able to design with correct taste, to manage the business of his calling in a business-like way, to protect his client's interest by his practical knowledge, to be able to direct the decoration, and last, but not least, to prove to the world that his scientific knowledge of such matters as ventilation and drainage is at least equal to the best specialist, and superior to the advertising and often ignorant pretenders.

I will not pretend that there is no better way of doing any portion of the work than that given in the following articles; but students may learn much from them, and more experienced students be led to consider the subjects treated, and so develop their own ideas for the benefit of younger men.

##### DESCRIPTION OF THE HOUSE.

The building selected for our first subject is a middle-class house containing ample accommodation for a family of average size, as follows, and the building forms one of a series, the designs of which were executed for an estate at Hampstead a short time since:—

*Basement.*—Breakfast-room, larder, pantry, kitchen, scullery, and the various offices adjoining.

*Ground Floor.*—Drawing and dining-rooms, library, cloak-room, with w.c. and conservatory.

*First Floor.*—Five bedrooms, bath-room, housemaid's lobby, and w.c.

*Second Floor.*—Three bedrooms and cistern room.

The level of site, as will be seen by the drawings, is much lower than the adjoining roads.

The drawings will fully illustrate the arrangements of the building and the details of its construction, while the specification will describe the materials in each trade, the construction and fittings being rather superior to the work of a speculative builder for a house of the class.

**SPECIFICATION** of the works to be performed in erecting and completing a detached residence in ——— road, Hampstead, in the County of Middlesex, according to the drawings No. 1 to —, and such other explanatory and detail drawings as may be supplied from time to time, and under the superintendence of the architect.

##### PRELIMINARY.

1. *Notices.*—Give notice to the District Surveyor of East Hampstead, and pay his fees. Give notice to the surveyor of the Hampstead Vestry, deposit plan of drains, and pay the fees for connection with sewer.
2. *Hoarding.*—Obtain a license from the Hampstead Vestry, pay the fees, and erect a suitable hoarding with gates.
3. *Water.*—Provide water for the use of the works.
4. *Insurance.*—Insure the building for the full amount of the contract in the joint names of the employer and contractor, in an office approved by the architect, and deposit the policy with him.
5. *Attendance.*—Attend upon, cut away for, and make good after all trades, in all trades, including gas-fitter.
6. *Rubbish.*—Remove all rubbish from time to time and at completion, and leave the whole of the building clean, perfect, and fit for occupation.

VOL. LV.—No. 1750.

FRIDAY, JULY 20, 1888.

## CONTRACTS WITH LOCAL AUTHORITIES.

THE numerous local authorities about the country are the creations of a complicated series of statutes which refer to and run into each other in a most remarkable manner. It is this confusing method of legislation that is continually leading to litigation, and constantly giving our Courts troublesome work to do at the expense of the ratepayers, or at the cost of some unlucky contractor or surveyor, who has lost his way amongst the mazes of the many Acts of Parliament with which the doings of local authorities are surrounded. It is well for those who have any transactions with guardians of the poor, sanitary boards, and the like, to know something of the principles of the law, at all events, by which these bodies are regulated. The over-lapping of the various new jurisdictions conferred upon the old corporations have led to strange results, and to the raising of many natty points about the meaning of the legislature. The recent case of "Dearle v. the Guardians of the Petersfield Union" (*Times*, 6th June), in the Court of Appeal, is an excellent example of what we mean, and it may also be taken as a useful warning to all who have dealings with local bodies. It was an action by a contractor against the defendants, acting as the rural sanitary authority, to recover certain sums of money alleged to be due to the plaintiffs, under an agreement relating to the construction of sewers. There was no question as to the orders having been given, the agreement made, and the work done, although the amount due was a matter of the decision of an arbitrator to whom it had been referred. But the defendants took preliminary objection that the claim was barred by a special statute of limitations passed for the protection of poor-law guardians. This Act is the well-known 22nd and 23rd Vict. c. 49, which, in Section 1, declares that all debts incurred by the guardians of any union shall be paid within the half-year in which the same shall have been incurred or shall become due, or within three months afterwards, from the expiration of such half-year. The action was brought in May, 1887, and the work charged for was one during 1885 and 1886. The half-year for poor-law guardians ends on 25th March and 9th September in each year, so that if this action was applicable to the present claim, it would be too late, and the debt would have been barred.

But then it was clear that the clause we have quoted only affected poor-law guardians as such, and had nothing to do with sanitary boards. When the Act was passed in 1859 these guardians had no duties whatever in regard to sanitation, and the limitation of actions given thereby was to protect them in their capacity as poor-law guardians, which was then their sole reason for existence. When, however, the Public Health Act of 1875 was framed, it was provided, in order to cover country places, that the area of a union, not within an urban district, should be made a rural district, and the guardians of the union were constituted the local authority over such rural district for the purpose of carrying into effect the sanitary provisions of the statute.

In accordance with the usual slipshod manner in which even our most important acts are drafted, a general clause was inserted in the Public Health Act, 1875, at the end of the section creating this rural

authority, declaring that "all statutes, orders, and legal provisions applicable to any board of guardians shall apply to them in their capacity of rural authority under this Act for the purposes of this Act." The point now raised by the defendants was that this sweeping proviso dragged in the limitations given by the statute of 1859 as to claims against poor-law guardians, and applied that limitation to all claims against these guardians, even in their new and entirely different and distinct capacity of rural sanitary authority under the Public Health Act 1875. It is needless to dwell upon the shabbiness of this defence, for it is well known that corporations have no conscience, and it may be said that the guardians were bound to dig out this merely technical point of law, and raise it as a solemn legal argument on behalf of their unlucky ratepayers. At all events the plan failed, and the Queen's Bench Division held the defence bad. This might, and should have been, enough for the guardians; but we know well the love of litigation that is fostered by fighting with other people's money, and doubtless those lawyers who advised this rural authority thought it a very pretty point indeed, and so recommended an appeal. This, however, was equally unsuccessful, and now the ratepayers have nothing more to do but note the decision and pay the little bill.

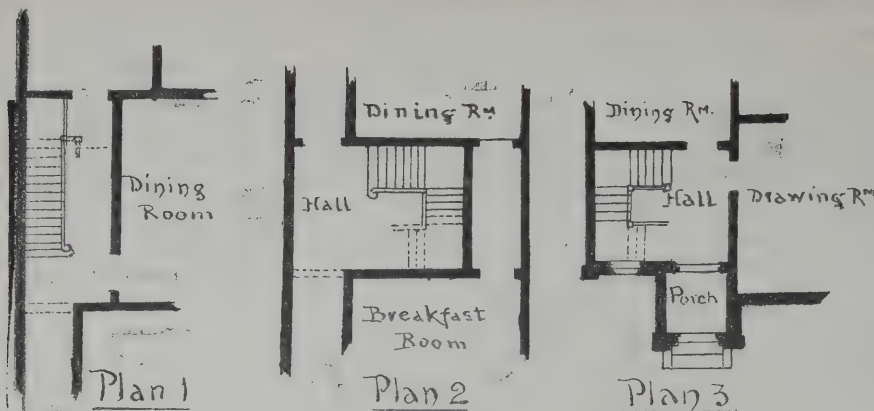

The judgment delivered by Lord Justice Lindley is marked by all that strong sense and sound law which distinguish this learned judge. As he pointed out, it was plain that the intention of the Act of 1859, which we have quoted, was to limit the period of bringing actions against guardians of the poor for acts done by them in that capacity. While the guardians were confined to contracts affecting the wants of their union in this regard, such a limitation was doubtless wise and desirable; but at that time the guardians had no powers as to the promotion of the public health, and probably no one had ever thought of intrusting them with the enforcement of sanitary duties. They were not enabled, under the Act of 1859, to enter into any contract for the construction of sewers or to incur debts for any similar objects. As far as logic went, it was clear enough that the Act of 1875 did not mean, and could not have meant, to drag in this limitation of actions and apply it to guardians in their new capacity of sanitary authorities; but in law the sweeping words we have noted had to be got rid of and explained. The defendants urged that this comprehensive clause brought in everything from the earlier Act of 1859 affecting guardians of the poor, and applied it all to the same guardians as a rural board, including, of course, the fixed periods of limitation. The Court of Appeal, however, were fortunately equal to the task of untying this knot and of preventing injustice from being done by a bungle of legislation. They held, with much subtlety, that the clause in the Act of 1875 did not extend the provisions of the Act of 1859, affecting guardians of the poor, to all acts which a sanitary authority might do; but it only extended those provisions to a sanitary authority when they were exercising the powers of the guardians of the poor. The contract in question being for the making of sewers, was obviously one which a sanitary authority had power to enter into, but which guardians of the poor, in their capacity as such, could not have made. "All's well that ends well," and so the contractor will get his money, while a case has been decided for future use and a precedent set up, at the expense of the unmindful ratepayers of Petersfield. But the moral is that it is a bad plan to give long credit to any corporations, and also that the various capacities in which local authorities act under different statutes needs to be heedfully borne in mind and well distinguished.

## HALLS AND STAIRCASES.—I.

NO other part of the interior planning of buildings reveals the architect's skill to so large a degree as the hall and staircase, although it is one of the most neglected portions of ordinary houses. In the common type of street dwelling the passage answers the purpose of the hall, and along one side of it a ladder-like flight ascends to the landing and thence to the first-floor level, the same staircase being repeated to the second, third, and fourth floors; these stair-flights, which face the front door, are neither easy nor inviting: in the smaller tenements, they are "break-neck" arrangements, too narrow for two to pass comfortably; in other cases they are dark and dingy, thrust out of sight as much as possible, as if they were evils to be avoided. The cramped, "steep riser" stairs is one of the inventions of quite recent times in towns, two houses being built where only one ought to stand. In the country the old spacious hall and staircase are yet to be seen in the residences not only of the gentry but the agriculturists. Numerous old farm and manor houses show the hospitable hall, the short, easy flights of balustraded stairs with square landings, and sometimes the old screens and galleries. The antique carvings and carved-oak newel staircase still survive to tell their tale of festal receptions. These arrangements are only the survivals of the still more lavish hall of feudal times, and of the later Tudor period. The memory reverts to the old English hostel, such as the "Tabard," described by Chaucer in the "Canterbury Tales." We can trace back still further when the Norman hall was the chief apartment, in which the king or lord of the manor administered justice, gave audiences, and entertained guests. Such were the halls at Mayfield, Sussex; Penshurst Place, Kent; Eltham, Westminster, Crosby, and other noble examples with their open-timber roofs. The entrance screened off at one end, with a gallery above; the raised dais at the other end, at which the host and superior guests sat; the open hearth and louvre for escape of smoke; the large bay windows are still seen in the University halls. And there is direct evidence that the atrium of the old Roman house, open to the air, with its surrounding colonnade or verandah, was the germ of the hall of the Tudors. After this epoch the hall lost its significance as a chief apartment; the domestic offices and private reception-rooms became more numerous as the habits of civilised life became more pronounced, and private apartments gradually encroached on the space formerly appropriated to the central hall. This tendency has gone on increasing to our own day, when the private apartments are now regarded as the principal portion of the house. Less and less space was given to the hall, till we find the hall and stairs dwindled down to the insignificant proportions they assume in the modern middle-class house. It cannot be denied we have sacrificed much of the dignity and importance of the interior in giving the hall and staircase so scanty a portion.

There are many varieties of halls and staircases to be found in the United Kingdom. Somewhere in his instructive work on "Baronial Architecture" Mr. R. W. Billings describes the singularity and beauty of the Aberdeenshire castles and houses. These are generally circular in plan, and some of them are very wide and elaborate in design. One at Fyvie is pointed to as the largest circular staircase in Britain—a coach-and-four might be driven up it; the steps, instead of being in single stones, being carried by a series of triangular vaultings. The staircase at Glamis has a hollow newel the whole height; at every floor there is a doorway. Its original purpose was for drawing up water to the different stories—a use which may be taken to be the germ of the modern lift, which sometimes occupies this position.

One notable modern instance are the staircases to the Law Courts, London, where the hollow newel is pierced, forming a very charming centre feature. In other parts, as Forfarshire, the plans of staircases are generally parallelograms.

Italy is, however, *par excellence*, the land of palatial staircases and halls—a development of the subject into which we do not here propose to enter.

Practical, rather than architectural, considerations have been mainly dealt with in treating of these portions of the interior of our houses: for some unaccountable reason, there have been few attempts to make the hall and staircase the centre of architectural contrivance and art, such as they were during all the great evolutionary periods of architecture, and the subject has been looked upon as a sort of *bête noir* by many of the profession.

Halls and staircases may be divided into three well-known arrangements: I.—(1) have halls in front; (2) at the side; (3) in the centre. II.—(1) staircases in halls; (2) lateral to halls. We intend to speak of these arrangements, beginning with the smaller and simpler types of staircase-halls we find in ordinary dwellings, and by a “staircase-hall” we designate a hall occupied by stairs.

Three very common plans are to be noticed in town dwellings (see sketches Nos. 1, 2, and 3). The first and commonest class is the entrance and staircase on one side, the latter in front of the entrance. The advantages of this favourite builder's arrangement are obvious. The whole depth of the house can be utilised; a showy staircase, tolerably well lighted, is obtained. On the other hand, there are disadvantages. The stairs are exposed to the view of every visitor who enters the hall or stands within the threshold, and therefore, privacy is sacrificed; it is a somewhat draughty and uncomfortable plan; the back passage is often dark, if there is a projecting range of offices in the rear. No. 2 plan: the stairs are in a central position between the two rooms, far more desirable as an architectural arrangement and more private, but not so easily lighted as in the first case, unless by a large skylight at the top of the house. By a lobby entrance and a glazed door shutting off the hall from the back part of house, considerable comfort in winter time can be enjoyed. A very economical mode of placing the stairs in a house with a good frontage, or semi-detached, is shown in plan 3, especially when there is room for a spacious porch in front. The advantage of this position for the staircase is that good light can be obtained in front or at the side, and a spacious yet compact hall formed, from which the reception rooms are easily entered. It is not, however, quite so private as No. 2 arrangement, unless a large porch or outer hall can be attached to it. There is one way of obtaining light to a staircase hall, planned as in No. 2, when the house adjoins another—namely, to bring in the wall at the back of stairs, and make a

small area of the whole width of staircase. Windows may then be introduced into this wall which can be filled with ground or painted glass. The introduction of open areas for light affords the means of placing staircases in the centre of a building; they are otherwise restricted to outer walls and angles. When the houses are semi-detached or isolated, the recess for light would, of course, not be needed. There are many convenient and architectural arrangements of this type to be found in well-planned villas, where a side projecting porch or entrance, set back from the main front of house, introduces the visitor into a transverse hall with staircase at one end. A few suggestive plans of this sort we shall illustrate as we proceed, confining the reader's attention, first, to the staircase hall, as the simplest arrangement for small middle-class dwellings; and, in the next place, entering upon the arrangement in which the staircase is separated from the hall, each being made a distinct feature of importance, as we find in the larger class of noblemen's and gentlemen's residences.

Before we enter further into the subject, we may devote the remainder of this introductory article to the consideration of some of the leading principles of staircase planning and construction. The precepts of the old masters are generally wise, though sometimes rather too empirical and arbitrary for modern requirements. That learned and talkative commentator, Vitruvius, curiously enough, says little about the staircase. Palladio, one of the Italian Revivalists, furnishes a few rules, and observes that stairs “will be perfect if they are spacious, light, and easy to ascend, appearing to invite people to mount.” He says they should never be narrower than 4ft. 6ft., so that two persons may pass each other; the steps not exceeding 6in. in height, nor their breadth less than a foot. He further alludes to the ancient practice of making the number of steps of an odd number, so that the same foot may be used in finishing as in beginning a flight, and eleven, or at most thirteen, steps are considered sufficient before reaching a landing. These and other rules, useful as they are, have to be altered to suit circumstances. It is not always possible to make a staircase 4ft. 6in. wide, to have steps of 6in. rise and a foot in tread, and to have an uneven number of steps to a flight. A right-hand handrail is no doubt an advantage, though it cannot always be arranged. The relation between rise and tread is of far more importance in determining an easy and convenient staircase. Blondel, in his “Cours d'Architecture,” has given a method that has been found to give favourable results. He assumes a distance of 24in. as being a convenient step upon level ground, and 12in. as a convenient height to rise, and this proportion gives an agreeable grade or ascent, for the difficulty of ascending a staircase is in proportion to the rise of each step. There is a certain relation of width of step to its height that ought to be observed—the greater

the rise, the less should be the width of step; in other words, the distance travelled at each step should vary as the grade, or inversely proportioned to the angle of ascent. A good proportion of step for a dwelling can be found by the following equations where  $r$  = the rise, and  $t$  the tread;  $r = \frac{1}{2}(24 - t) = 24 - 2r$ . From these rules it is found that if the height of step be 5in. the tread must be 14in.; if the rise is 6in., the tread must be 12in.; if the rise is 6½in., the tread must be 11in., and so on. The following table gives the higher risers usually met with in dwellings.

Rise.	Tread.
6.75	10.50
7	10
7.50	9
8	8
9	6

In designing plans of staircases, the foregoing rules are rarely followed; a certain run or length, and a given height, are predetermined by the plan of house, without any regard to easy grade. The length between the extreme risers is fixed, so is the total rise from floor to floor, and in this space the stairs are made to fit: the consequence is that the number of risers is more or less than desirable for an easy ascent. Thus between the extreme risers of a flight which is limited, a certain number of steps is divided out by the compasses, the width of each tread being a mere matter of convenience. Many of our staircases are spoiled by this rule-of-thumb setting out, just for the sake of saving a little labour in extending the staircase walls. A preferable method is to adopt a height of riser, and to find a width of tread by the second equation. Thus, if the distance between the extreme risers is not limited, and a riser of 7in. is fixed upon we have  $t = 24 - 2 \times 7 = 10$ in. as a tread that will insure an easy ascent. The mistake made by many architects is to leave the staircase to be adjusted after the other part of the plan are decided, instead of first deciding upon a grade of stairs suitable to the class of building. The subject of staircases also has been treated mainly from a constructional and technical point of view in which the various kinds of stairs made by joiners, handrailing, face-moulding, and other processes are described. The consequence has been that the young architect at the threshold of his studies has become disgusted with the technicalities of the craft, and has fallen back on his own resources. In the ordinary handbooks on the principles of handrailing not a word is vouchsafed upon the art of arranging or planning staircases architecturally, and the architect is therefore compelled to seek for precedents in other buildings or to copy arrangements that are defective or unsuitable to the purpose. In the following articles we intend to present a few typical arrangements, pointing out the merits and defects of ordinary plans—our object being to show that the hall and staircase should become the germ of the plan round which the rooms can be grouped, how very much of the comfort of a residence depends upon the location and arrangement of the hall and stairs, and how considerable and important a feature they are in the architectural arrangement of the design both internally and externally.

#### THE METROPOLITAN BOARD OF WORKS INQUIRY.

THE eighteenth sitting of the Royal Commission of Inquiry into the working of the Metropolitan Board of Works was held on Friday, Lord Herschell presiding.

Mr. George Brick, builder, recalled, said Mr. Sherwood and Mr. Coxhead were present at 35 Lisson-street when witness, Mr. Brown (the owner), and Mr. Thomas (of the Dangerous Structures Department) inspected the premises. Witness had visited the premises since the last

meeting of the Commission, and he was positive that the party wall complained of had not been taken down. The fissure which was discovered in 1884 was still there. Witness put his rule into seven places, and in one pushed it through to the extent of 20 in.

Mr. E. J. Sherwood, architect, said he accompanied the last witness to 35, Lisson-street in April, 1884. He remembered seeing there Mr. Brown, who introduced Mr. Thomas as "my friend." The inspection of the wall was made in witness's presence. They examined the front, and then proceeded to the first and second floors. Mr. Thomas walked up to the fissure, put his umbrella in it, and said that nothing need come down, adding that he was surprised that anyone should condemn the wall.

Mr. Frederick John Coxhead, builder, corroborated the evidence of the previous witness relative to viewing the premises, 35, Lisson-street on the occasion referred to, in the presence of Mr. Brown, Mr. Thomas, Mr. Brick, and Mr. Sherwood.

Mr. Thomas, recalled, said he never saw Mr. Sherwood or Mr. Coxhead on the premises. Mr. Sherwood he saw before the official referee; but until now he had never, to his knowledge, seen Mr. Coxhead in his life.

Sir Joseph Bazalgette, chief engineer of the Board of Works, recalled, gave further particulars with reference to the demolition of the old Battersea Bridge, and its reconstruction on the same site as the old one. He was also examined with reference to the purchase by the Board of some land adjoining the approach to Battersea Bridge for the purpose of widening the road. Mr. Furness, he said, was contractor for the Thames Embankment from Westminster to Waterloo bridges. The contractors for the part east were Mr. Webster and Mr. Richardson. A contract for the Thames Embankment north was let to Mr. Furness in October, 1863; another contract to Mr. Richardson in January, 1864; and a contract for the roadway on the Victoria Embankment was let to Mr. Webster in April, 1872. Mr. Webster had a contract in 1868 for a part of the Embankment. Lord Herschell.—At the time Mr. Furness's contract was accepted there was a lower tender?—Yes; there was one of £495,000 by Mr. Ridley, and Mr. Furness's was £520,000. Was Mr. Furness's the highest tender?—No. Several tenders were rejected, and witness recommended the Board to readvertise the contract; but, after consideration, they determined not to do so, and gave it to Mr. Furness. A question was raised with regard to you having yourself had some financial arrangement with Mr. Furness—not about this work?—That, really, was not a financial arrangement. Sir John Rennie obtained a concession for a contract in Odessa, which he had to carry out within a given time, but he had failed to get a contractor. He offered to part with the contract on condition of his having 5 per cent. for the concession. I was thus dealing with Sir John Rennie in reference to a contract in another country, having no reference whatever to my official position. I introduced Sir John Rennie to Mr. Furness, and he agreed to take the contract. An agreement was drawn afterwards that Mr. Furness should pay to him one half and one half to me. Had that been completed at the time of this tender of Mr. Furness's?—Early in 1862 Sir John Rennie proposed it to me. Mr. Furness's contract was in October, 1863. The Odessa matter was not over at that time. What was the amount of payment made by Furness to you under that arrangement?—Not a penny. I received no benefit whatever. When I found that it was thought that my having that connection with Mr. Furness might interfere with my official duties I relinquished all benefit in it. That was subsequent to Mr. Furness's contract?—Yes. What was the amount which you would have received, and which you relinquished?—I forget the amount; but it was a large sum. In carrying out of the contract by Mr. Furness did you permit any variations from the specifications as to the mode of filling in the reclaimed ground?—The ground was to have been filled in by dredging from the river; but the Conservators did not carry out the dredging as rapidly as our work required, and consequently we had to obtain ground from other places. Was that a benefit to the contractor?—I think so, but what I don't know. I had nothing to do with it. If there was a cheaper way of

doing the work, why was not the cheaper way specified?—It was a stipulation with the Board that we should take the ground from dredging in the Thames, the object being that it might improve the bed of the river without extra cost. Have you had any interest in any lands taken for the purpose of the Board's improvements?—I have had no interest in any land or property of any kind within the metropolitan area, with the exception of one house in the West-end of London, which was left to me by will. Where did the stone come from for the Thames Embankment?—The Dalbeattie and Scotch quarries. We found that we could not get it fast enough, and eventually had to obtain it from a number of different quarries. Neither I nor my family had any interest in any of those quarries. What are the more recent works which have been carried out by your department?—The largest at the present time in hand is the northern outfall precipitation works, the estimate for which is £406,000. We have let recently to Mr. Webster, jun., a contract for the southern outfall works at a cost of £259,000. We have in hand Battersea-bridge. We have just completed Putney and Hammursmith bridges, and we have a good many minor works. The witness explained the nature of the works to be carried out in connection with the subway at Greenwich. The work would cost something under 1½ millions.

Mr. Bosanquet: The largest contracts have been taken by Mr. Webster?—Yes. Was his the lowest tender always?—Most frequently; but sometimes there were lower. Inquiries were made as to the lowest, and when not accepted they were not considered satisfactory. Did you advertise for everybody to tender who liked, or did you take a selected class of persons?—We advertised for public tenders. How are they submitted?—They are opened by the chairman at the Board. Everybody is equally at liberty to tender for all contracts?—Yes. Mr. Studd: How much were you to have received on the Odessa contract?—I don't remember. Was an inquiry held into your conduct in the matter?—Yes. At a committee meeting of the whole Board?—Yes. With closed doors?—It was a committee meeting, and of course it would be with closed doors. Was a motion made by the chairman that the report should not be sent to the vestries, as is usual, but only to the members of the Board?—I don't know. Do you remember any members of the Board stating that had they known that you were engaged in the Odessa contract they would not have voted for Mr. Furness?—I don't remember. A lower tender was that of Mr. Baker?—Yes, he withdrew. Was it because there was no arbitration clause in the contract?—I believe it was. When there was no arbitration clause it meant that you would have a perfectly arbitrary power over the way in which the contract was carried out?—I would be the arbitrator, in fact; that has been so in all the Board's contracts. I suppose that if an arbitration clause had been inserted you would have got a great many more tenders?—I should think not. Is it not a fact that most of the best building firms will not tender when there is no arbitration clause?—No; we get tenders from the best firms. Contractors know my character pretty well, and know themselves whether I should deal with them fairly or not. Mr. Webster was the contractor for the southern low-level drainage works?—Yes. Did he use, in carrying out that contract, the bricks which should have been used in accordance with the specification?—I have no doubt he did. With regard to filling-in the reclaimed land on the Thames Embankment, the witness, in answer to Mr. Studd, repeated that the Conservators could not supply the sand fast enough to go on with the works, and delay was serious. Do you remember a statement being made in the committee that his not taking the sand would make a difference of £80,000 in favour of the contractor?—No. As to Battersea Bridge, was any compensation paid to anyone in connection with the alteration of the plans?—I know of none. Who received the largest compensation?—I don't know; I have nothing to do with compensation. After the second plans had been passed by Parliament, did you not alter them so as to include property which was not previously included?—I don't know what you mean. There is a property called Little Hell?—I don't recognise the name at all. By Mr.

White: I had nothing to do with the purchase or letting of property in any way.

Mr. Horace Grundy, district surveyor for Paddington, gave evidence as to a question which was discussed in 1875 relative to the erection of a furniture warehouse in Queen's-road, Bayswater, for Mr. Whiteley. The witness had reported to the superintending architect of the Board that the building did not comply with the regulations as to subdivisions. The matter was brought before the Building Committee of the Board, and it was suggested to witness by Mr. Vulliamy that it was not necessary to take proceedings. Lord Herschell: On the 8th of April I find you write to Mr. Vulliamy: "It has been suggested to me on behalf of Mr. Whiteley that, after reporting to the Board on the irregularity, it is not my duty to take proceedings without a further order."—Witness: I don't recollect that. That suggestion must have been from Mr. Whiteley's architect. Who was his architect?—Mr. Ebenezer Saunders. Mr. Chas. Roche was Mr. Whiteley's solicitor. He was also a member of the Metropolitan Board?—Yes. So far as I understand, the Building Act Committee decided in this particular case that a building used for storing furniture for the purpose of being sold by retail was not a building used either wholly or in part for the purposes of trade? I think the effect of the notice was that it was not for storing furniture, but for exposing it for sale. As a matter of fact, other people's furniture was stored there?—Just so. And the building was burnt down?—Yes.

At Tuesday's sitting Mr. Augustus Harris, lessee of Drury-lane Theatre, recalled, said, in reply to Lord Herschell, that he had seen a statement in the evidence of Mr. Hebb to the effect that the tickets for the theatre which that gentleman obtained had been asked for at witness's request. He had never requested Mr. Hebb to ask for any tickets, and the statement was absolutely false. The letters which had been published were the only communications which he had received from Mr. Hebb, and they spoke for themselves.

Mr. Hebb said it was quite true that he had had no communication with Mr. Harris personally. When he stated that he had been invited to write he intended to say it was at the suggestion of Mr. Harris's manager, who told him expressly that he would not admit him by what he called "face presentation." If he wished to go to the theatre, he was informed, he must write to Mr. Harris. By Lord Herschell: That was when you went avowedly for the purpose of inspection?—In the daytime I had no difficulty, but this was when I went in the evening. With a friend?—Yes. Then the manager told you that if you wanted to go to the theatre you must write?—Yes. Lord Herschell: That is hardly requesting you to write for tickets.

Mr. Harris: To call it a request is putting it in a false light. Refusing admission is hardly an invitation.

Lord Magheramorne, Chairman of the Metropolitan Board of Works, was the next witness. He said that he became a member of the Board in 1867, and had been chairman since 1870, when he succeeded Sir John Thwaites in that position. The office was a salaried one. Sir John Thwaites received £2,000 a year, and witness on his election £1,500, this being raised some years afterwards to £2,000. He presided at meetings of the Board and of the Works Committee, and attended other committees as an ordinary member. By Lord Herschell: The Board had a very large amount of property to deal with in the way of buying and selling?—Oh, yes. The Works Committee consists of all the members of the Board?—Yes, sixty members. And the attendance is often as numerous as fifty?—Very often. Does it strike you that that is hardly the kind of body suited to deal with the management of the sale of a large estate and all the details connected with it?—The officers report to the Works Committee. Does that not necessarily leave the matter in the hands of the officers?—I do not think so. They make their reports to the committee, these go before the solicitor, and I must say they receive the greatest possible attention. The result seems to show that the matter was in the hands of the officials of the Board, who did very much what they liked?—I do not think so. Were you under the impression at the time that people who sent in tenders were

tendering with any knowledge of what the architect's valuation was or what was likely to be accepted?—I had not the faintest idea that they could have any knowledge. I have absolutely refused to allow the architect's valuation to be divulged to anybody. Now it rather looks as if it were divulged to anybody?—I do not know. The result was that it was communicated to certain persons whose offers the Board believed to be an entirely independent valuation?—It is an unfortunate thing that there had been one or two rogues who have been found out, and I trust we have got no more. We have at present a different plan, and, as far as I can see, it is impossible for anyone to have the information excepting the architect. Had you at any time any suspicion of the action of Mr. Goddard?—Never. I was never more surprised in my life, and could not believe my ears when I heard the statements made against him. He was trusted entirely. I had not the faintest suspicion that he could do wrong. I looked upon him as an honest and straightforward man.—Were you aware that members of the Board who were practising as architects were doing work in connection with matters that came before the Board?—Once or twice I was told that Mr. Saunders had to do with one building and Mr. Fowler with another, but I did not know it until they were erected. Once a question came before the Board with reference to the Hotel Métropole, and Mr. Saunders told me that he was interested in it, and would take no part in its discussion. He left the room. Mr. Vulliamy, the superintendent architect, fell into ill-health a year before he died?—Yes. He retired on a pension of £1,020?—Yes. After that he returned and said he found he was fit for work?—The Board had tried to get a successor, and failed. It was a mutual accommodation that he should return and do the work until a successor could be found. Was he not paid until the time of his death the usual salary and his pension as well?—He was. Why was that?—I presume the reason was that the majority of my colleagues thought they would have had to pay some one the salary and Mr. Vulliamy his pension at the same time. But it is strange that services which were only worth £1,750 when he was in full health should be worth £2,770 when he was in ill health?—Quite so. Questioned as to Mr. Hebb's applications for theatre tickets, witness said the matter was brought to his attention two years ago on a complaint by the manager of the St. James's Theatre. He told Mr. Hebb that his conduct was most reprehensible; but, believing the application to be an isolated case, he did not bring the subject before the Board. Did you make any inquiry as to whether he had asked for tickets elsewhere?—It never crossed my mind that he could do such a thing. (Laughter.) If the correspondence with Mr. Harris had been brought to my knowledge, I should have called the attention of my colleagues to it at once. By Lord Herschell: Has the balance kept at the London and Westminster Bank been increased?—No, decreased. We buy Treasury Bills if the balance at the bank is above £250,000. By Mr. Winch: The Board of Works had never kept an account at the Bank of England to witness's knowledge. The money for the coal and wine dues was paid into that bank and then transferred to the London and Westminster. All the Board's loans were brought out by the Bank of England. With regard to this land jobbing, was any suggestion made to you that it was being carried on by Mr. Robertson, or Mr. Goddard, or any one else?—No.

Mr. Thomas G. Fardell, a member of the Metropolitan Board, said he had strongly but unsuccessfully advocated the submission of the London Pavilion site to public competition, because it was one of the finest sites in London, and he did not think a music-hall suitable for such a position. He did not know at that time that Mr. Robertson, Mr. Goddard, and Mr. Villiers were mixed up in that transaction. He was a member of the committee which inquired into Mr. Robertson's conduct. Two or three days before the final report was presented he received a letter from a gentleman who had seen Mr. Robertson, expressing a hope that if he thought there was no ground for the allegations he would endeavour so to frame the report as to acquit Mr. Robertson of any wrong intentions. To the report, which partly excul-

pated and partly censured Mr. Robertson, an amendment was moved to dismiss that gentleman. This was lost by 19 to 26, witness voting in the minority. On July 29, 1887, he moved to invite the Government to appoint a Royal commission and was defeated by one vote. Mr. Saunders on that occasion voted in the majority. (Laughter.) He could not say whether Mr. Fowler voted, but that gentleman moved the adjournment of the Board before the motion was taken.

Mr. H. Bennett, assistant engineer, and Mr. John Gooding, who was employed under Mr. E. Bazalgette, assistant engineer at Battersea Bridge, stated that the bricks used in the works under their supervision were in accordance with the specifications. Bricks had been sent to the Battersea Bridge of inferior quality, but these were not allowed to be made use of. The witnesses declared that they had received no payment or consideration from any contractor. The inquiry was adjourned to Tuesday next.

## STRAINS.—II.

By G. A. T. MIDDLETON.

### SHEARING STRESSES IN CANTILEVERS AND BEAMS

THE opposition of the two forces spoken of in the last chapter—the load borne by a beam or cantilever, and the reaction of the supports—causes in the beam a strain similar to that caused in a piece of thread when exposed to the cutting edges of a pair of scissors, which strain is known as "shearing." Scissors, however, are made sufficiently powerful to overcome the resistance which thread makes to being shorn, while beams have to be designed to contain sufficient material in their webs (if they be of the flanged type) to resist the shearing effect of the load and reaction.

In the case of a cantilever carrying an end load (Fig. 8), the reaction  $R$  and the load  $W$  are

Fig. 8.

equal to one another; but their lines of action, though parallel, are opposite in direction. From this it follows that the member which enables these two forces to oppose one another, and so to produce equilibrium, is subject at each point throughout its entire length to a shearing strain equal to either one of them—not to the sum of the two, for where two equal opposing forces of any kind meet, the strain produced is the measure of one of these forces only, because there could be no strain at all unless each force were opposed by an equal and opposite one, either active or passive. This can be shown graphically, as in Fig. 8, by setting down a line under  $W$  equal to  $W$  (here assumed as 5 tons) to any scale of weights, and completing the shaded parallelogram. Ordinates drawn from beneath the cantilever to the lower limit of the parallelogram will give the shearing strain, to the same scale, at any point.

When a cantilever carries a distributed load, the shearing strain is only equal to the total load at the point of support, and uniformly diminishes as the reaction is met by one portion of the load after another, until at the end of the cantilever there is no shear at all. This can be shown graphically, as in Fig. 9.

When a cantilever extends beyond the point of application of the load, there is, of course, no shearing strain beyond that point, save that

caused by the weight of the cantilever itself; and this, though occasionally of considerable importance in practical work, is rarely taken

Fig. 9.

into account in purely theoretical investigations.

When a cantilever has to bear two or three different loads, the shearing diagrams have to be combined, as in Fig. 10, where a cantilever is represented as bearing a fixed load of three tons at one quarter of its length from the support, and a distributed load of five tons spread over the half of its length furthest from the support.

A fixed load on a beam causes a shearing

Fig. 10.

strain at all points between its point of application and either support equal to the reaction at that support. The reason for this is the same as in the case of the cantilever: at every point between the point of reaction and the point of application of the load, the reaction is endeavouring to tear its way through the beam to reach the proportion of the load which equilibrates it. In Fig. 11 the dotted outline

Fig. 11.

denotes the shearing diagram due to  $W_1$ , the dot and stroke outline the diagram due to  $W_2$ , and the firm outline the combined diagram found by adding together at all points the shears due to  $W_1$  and  $W_2$ .

It must be particularly noticed that between the loads the shear produced by the one is augmented by that produced by the other, and not diminished. At each point between these

loads, to use a simile previously employed, two pairs of scissors are acting, one with a force equal to the reaction of  $W^1$  at the abutment A, and the other with a force equal to the reaction of  $W^2$  at the abutment B, the resultant shear being the sum of these two forces.

This fact, though generally admitted in cases where there are but two or three loads under consideration, has by some strange chance been overlooked by most teachers of this subject when the number of loads is unlimited—in other words, when the beam is carrying an evenly distributed load. Thus, the fallacious conclusion has been arrived at that such a beam may be treated as two similar cantilevers of half the span meeting at the centre, thus producing a shearing stress at each support equal to half the total load, and at the centre, of nil. The shearing stress at each support certainly is equal to half the total load, for it is equal to the reaction at the support; but if two loads cause a shear in the centre, which is equal to the sum of the shears produced at that spot by each, it follows that where there are an infinite number of infinitely small loads on each side of the centre, each one of which causes a shearing strain at the centre, the sum of these must amount to something.

If, as in Fig. 12, a definite number of definite

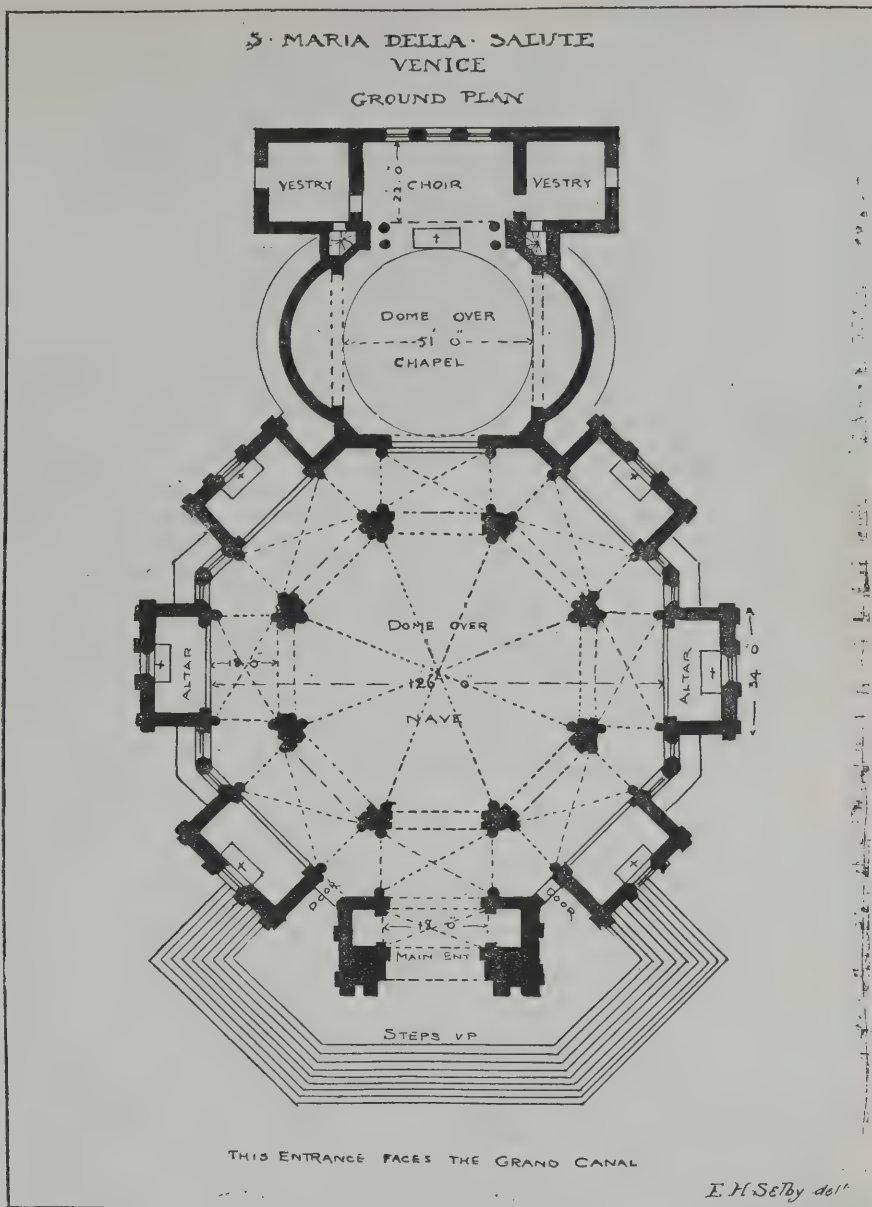

Fig. 12.

small loads be taken, making an aggregate of  $W$  (in this example taken as 10 tons), and if each load be treated separately, and the shearing stresses produced added together, it will be found that while the shear at each abutment is equal to  $\frac{W}{2}$  (5 tons), the shear at the centre is equal to  $\frac{W}{4}$  (or  $2\frac{1}{2}$  tons). The diagram for a truly distributed load may be completed by straight lines, as in Fig. 12.

That the shear in the centre is equal to  $\frac{W}{4}$  (or  $2\frac{1}{2}$  tons) is easiest proved by assuming that the load lying on each side of the centre may be represented by a fixed load of the same amount acting at its centre of gravity—i.e., by a load  $\frac{W}{2}$  (or 5 tons) acting at  $\frac{1}{4}$  the span from each abutment. One-fourth of each of these loads,  $\frac{W}{8}$  (or  $1\frac{1}{4}$  tons), is borne by the abutment furthest from it—in other words, each of these loads causes a shear of  $\frac{W}{8}$  (or  $1\frac{1}{4}$  tons) in the centre, making a total shear in the centre of  $\frac{W}{4}$  (or  $2\frac{1}{2}$  tons).

#### SANTA MARIA DELLA SALUTE, VENICE.

WE gave a photograph of this well-known church in the BUILDING NEWS for June 15th last, with a description of the building. To-day we supplement these with a plan, showing how cleverly the aisle and chapels round the dome are managed. Mr. E. H. Selby, in his sketch, gives the leading dimensions in figures for reference. In this connection it may be interesting to note a somewhat similar plan in general outline, but quite of another date and type of design—viz., the Liebfrauen Kirche, or Church of our Lady, at Treves. A square occupies the centre of the building in this case, and it is crowned by a lantern or tower. The chapels occupying the cardinal points of the plan, after the fashion

of nave and transepts, are octagonal-ended, and the two intermediate chapels diagonally situated within the triangular spaces thus formed between the ends of the transepts, nave, and choir (which has a semicircular apse) are also semi-octagonal. A similar arrangement to this is to be seen in the choir of St. Yved Braine, near Soissons, which may possibly have been the work of the same architect, being about ten years earlier than the Treves example (1227 A.D.). San Thomaso in Limine Bergamo is a well-known circular church, having an octagonal arcade within, forming an aisle all round the building; and Oster Lars Church, Bornholm, Gothland, has a solid wall inside, thus separating the aisle from the church. The roof over the main body of this building is conical. The choir is oval-shaped on plan, and the apse beyond is semicircular. Thorsager Church has a square formed by four columns in the centre of the circular nave, surmounted by a side-lighted lantern above a second church on the upper floor (Marryat's "Jutland and the Danish Isles"). Hagley Church, Gothland, should also be named as a singularly-treated circular church (Fergusson's "History of Architecture," Vol. I., Figs. 530-531). St. Lorenzo, at Milan, has an unchanged plan of great antiquity developed towards the type of domed churches of the Byzantine style, and is the earliest attempt to bring the circular church into a square shape. The diameter of the dome is 70ft., some 20ft. less than that of Sta. Maria della Salute. Ravenna possesses several circular buildings, one of the oldest of Christian origin being the baptistery of St. John; but the great church of St. Vitale furnishes one of the most remarkably complicated and beautiful circular buildings to be seen any-

where. It corresponds closely with the plan of the Minerva Medica at Rome, except being an octagon instead of a decagon. The central area is 50ft. in diameter, so that the dome here is a third less than that of its prototype. It is constructed of earthen pots and covered by a roof. The tomb of Theodoric, also at Ravenna, known as Sta. Maria Rotunda, is 45ft. in diameter, and the most singular part of this building is that the domed roof is formed by one great slab, internally measuring 30ft. in diameter, and hollowed out like a flat dome. Near the edge are a range of false dormer windows, which furnished really the handles by which the slab was originally lifted. St. Angeli, Perugia, the Baptistery at Nocera dei Pagani; the Tomb of Sta. Costanza, Rome; and the Baptistery of Constantine are instances of Romanesque circular buildings. The Chevet Notre Dame due Port Clermont, Auvergne, if doubled, would be very like the plan of Sta. Maria della Salute, only that the chapels are semi-apses.

The Council of the Surveyors' Institution have applied to the Metropolitan Board of Works Commission for an official copy of all the evidence given, or to be given, by surveyors and others during the course of the inquiry.

Memorial stones of the Wesleyan Chapel at Illogan, Redruth, were laid on the 6th inst. The internal fittings will be in pitch-pine, as well as the rostrum; the ceiling of chapel will be panelled in plaster, and the front will be in granite, with Elvin stone filling, the windows will be glazed with cathedral glass. The builders are: Mr. W. H. Moyle, of Chacewater, carpenter; and Mr. W. H. Gray, of Redruth, mason; and the architect Mr. Oliver Caldwell, M.S.A., of Penzance.

## THE NUTTER ORPHANAGE FOR BOYS, BRADFORD.

THIS building, which is intended for the maintenance and education of orphan boys in Bradford, is the outcome of a bequest of £10,000 by the late Mr. Joseph Nutter, of Halifax, formerly in business in Bradford. Mr. Nutter made it a condition that the money was only to be paid if within twelve months after his death some person or persons purchased or gave a suitable piece of land or buildings for the purpose of establishing the institution. The Town Council of Bradford felt it to be their duty to secure for the town the benefit of Mr. Nutter's munificent gift; and accordingly, with the authority of the Lords of the Treasury, they conveyed, free of charge, to trustees, the land forming the site of this building, and the grounds connected with it. The above sum has been duly invested, and the proceeds are set apart for the maintenance of the institution, the money required for the erection and furnishing of the orphanage having to be provided for by public subscriptions. The foundation stone was laid by the Mayor of Bradford (Alderman J. L. Morley) on May 31 last. The building covers an area of 99ft. by 49ft., and contains on the ground floor boys' day-room, dining-room, lesson-room, sick boys' day-room, committee room, master's room, lavatory, and ample kitchen arrangements. On the first floor are four dormitories for 40 boys, a sick boys' dormitory, master's bedroom, bathroom, w.c.'s, and linen room. A large room on the second floor will be used at present as a play-room, but may be used, if required, for 12 additional beds. As there is a higher board school within seven minutes' walk, the children will be sent there, and no provision is therefore made for teaching them in this building. The area of the site given by the town council is 3,000 square yards, and being situated between a large public recreation field and Horton public park gives exceptional advantages to the institution without burdening it with the maintenance of extensive playgrounds. The architect of the building is Mr. Thomas Campbell Hope, of Bradford. The contractors are Mr. William Holdsworth, mason; Mr. James Deacon, joiner; Mr. Richard Hill, plumber; Messrs. J. N. and A. E. Thornton, slater; and Mr. Benjamin Dixon, plasterer; all of Bradford and the neighbourhood. The amount of their contracts is £3,023. The building is faced entirely with common hammer-dressed wall stones and bosted ashlar dressings from the Bradford quarries. The interior will be well and substantially finished in every respect, and great care will be taken to insure the health and comfort of

the inmates by the use of the best warming, ventilating, and sanitary appliances. In addition to the above-named sum of £3,023, money will be required for furnishing. Nearly £3,000 has already been subscribed. One of the leading features of this institution is that friends of orphan boys will have the opportunity of sending them here on payment of a small annual contribution towards the expenses of their maintenance.

## DESIGNS FOR A GARDENER'S COTTAGE AND FURNITURE.

For description see page 90.

## OLD OAK ROOM, FROM KING'S LYNN.

THIS illustration is of a very interesting oak room, which was taken from an old house at King's Lynn, and is now erected at Mr. J. Mortlock's galleries in Oxford-street. It was made in the time of James I., is in a very good state of preservation, and beautifully carved. The house in Queen-street, where it originally came from, was inhabited by the Taylor family. Sir Simon Taylor lived there, who contested King's Lynn against Lord Keeper North. The dimensions of the mantel are about 7ft. in height and 11ft. in width. It is ornamented with ten figures in relief, representing Hercules, Medusa, &c., and bears the arms of Britain, quartered with those of France, and the mottoes "Hony Soyit Qui Maill Pences," and underneath "De it Mon Droit." There was a very curious tower at the back of the house, apparently used as a look-out on the river, and which, as it shows signs of rough usage from artillery, local tradition ascribes to Cromwell's soldiers. On removing the panelling from the adjacent room, the date "February, 1602," was found rudely cut in at the back. The mantelpiece and panelling was painted white in the last century, but has now been partially cleaned, and shows some of the good old oak. The room is well worth a visit from any one interested in genuine old work that has never been in any sense restored, and it can be seen at 31, Orchard-street, Portman-square.

## CLIEVEMERE, MAIDENHEAD.

THIS house is in course of erection on a fine natural terrace, well wooded, and facing the river, with the Cliveden woods beyond. The materials used externally are deep-coloured red Maidenhead bricks, and Bath-stone dressings, and cypress fir has been used in some of the long lintels. The rooms lead out of a triple central hall, or hall with ante-rooms so placed as to give a broad view of the gardens and woods beyond, as seen on entering from the approach drive. The architect is Mr. Edward Francis C. Clark, of 7, Westminster-chambers, and the builder is Mr. Thomas Crossley, of Bromley, Kent.

## RATHHAUS AT MOLSHEIM.

THIS picturesque building comprises an assembly hall on the upper floor, approached from the public street by means of an external staircase, and below, on the ground floor, is the Butchers' Market, to which the semicircular arches form the entrances. Our illustration is taken by permission from the last part of "Denkmaeler Deutscher Renaissance," by Herr K. E. O. Fritsch, and published by Ernst Wasmuth, of 35, Markgrafenstrasse, Berlin. We have already drawn attention to this most admirable work, which consists of an extensive series of permanent ink phototypes, equal in tone and texture to delicate silver prints, illustrating the Renaissance of Germany. Molsheim is really in France, of course, in the Lower Rhine, some ten or eleven miles W.S.W. of Strasburg, seated on the River Brusch. The town is quite small, with only from three to four thousand inhabitants; but its wine trade and manufactories of sword blades, wire, and ironmongery give it importance. The general outline of the façade of this charmingly-designed Rathhaus is very materially enhanced by the clock turret which surmounts the entrance porch in the centre of the front. The upper part above the dial is covered with small slates like the curved-shaped roof which surmounts it. A niche on the street side contains a figure of the Blessed Virgin and Child; while below this group, two boys, one on either side of the curved pediment, give dignity and interest to the composition.

An astronomical dial occupies the central panel above the time-piece, and standing on the right and left of the clock are two full-length figures of recording angels, who strike the hours and chimes on the projecting bells which hang in front of them. Two little windows in the return walls of the tower light the clock chamber, and under the main cornice is another dial, probably intended to record the four seasons, or perhaps the periods of the day. Shaped gables terminate the front, at each end of which are large wrought-metal gargoyles of grotesque design, boldly projecting diagonally with the elevation. Two small doorways from the assembly hall lead on to stone-corbelled balconies, which have open-traceried balustrades pierced in Flamboyant patterns, and corresponding with the parapet to the staircases below. The main walls are plastered, with the stone quoins at the angles and window openings shown. The long-drawn shadows of the early morning sun in the photograph furnish quite a sciographic study for the architectural draughtsman, and considerably enliven the quaint effect of the building. Molsheim is also possessed of a fine parish church, originally intended for a Jesuit College, and remarkable chiefly for the extreme lightness of its bell towers. The building contains a curious combination of Gothic and modern sculptures. It may be interesting to give a note here mentioning for reference some other notable German buildings of the class to-day illustrated; one of the most important and monumental being, of course, the richly-ornamented and arcaded Rathhaus at Bremen, which at once furnishes a typical example of the Renaissance. The notable, large porch added to Cologne Old Rathhaus in 1571 is a curious instance of the use of the pointed arch with Classical columns and cornices. It figures in Fergusson's "History of Modern Architecture." The Lubeck Rathhaus, with its inclosed external staircase, we have quite recently illustrated (see BUILDING NEWS, July 2, 1886). and the Gothic stone Rathhaus at Halle is curious for its Late German inverted arches over the window openings, and for the quaintly-shaped brick gable enriching its main façade. That at Altenberg, by Nicolaus Grohmann, the architect, has a tall tower and a square conical roof over the main building. The Rathhaus at Heilbronn is similar in general character to Molsheim having a clock turret in the centre of the front with the characteristic addition of an open arcade below. It dates from 1535 to 1596. A far richer clock, of much more interest, is to be seen in the elevation of the Rathhaus at Ulm with its Zodiac signs and other specialties of horography. A very charming timber-built Rathhaus exists at Schwabenberg in Westphalia, not far from Paderborn, erected in 1579, with carved wooden gables and an enriched arcade below of the same material. There are some good houses of a like kind at Rinteln, in the district of Schauenburg, where we see, too, a very picturesque Rathhaus worth naming. At Paderborn also is a remarkable stone-built Rathhaus, dated 1612-1616. At Halberstadt is an even more celebrated example standing in a fine open "place" surrounded by gabled houses and other buildings. The gabled Loggia and double staircase in the side façade was an addition to the older Gothic hall in 1663, and is particularly interesting for the German rendering of Italian detail which it displays. Something like this are the porch and staircases to the Rathhaus at Limgo in Lippe-Deimold. The grand old Mediæval town hall at Breslau, standing in the Grosser Ring of that busy city, is a florid specimen of 16th-century Gothic, bristling with turrets, gables, and oriels. Markt-Breit Rathhaus dates from the earlier part of the same period, with later alterations, of course, to which date of work the quaintly-devised gables are ascribed. It stands on a bridge partly over the river and partly over the street, and it is said to have been built thus to avoid removing existing buildings when a larger hall than formerly stood here was required. The picturesque effect thus secured is very characteristic of Mediæval German architects. Limburg-on-the-Lahn Rathhaus is another irregular artistic structure, and comprises by no means the least picturesque of the old buildings of that curious town. Ratisbon Rathhaus, built too entirely of stone, should be noted, and it has a projecting oriel covered by

a gable in the centre of the main façade. The conical roofed turrets which inclose oriels form the distinguishing features of the very pretty Rathhaus at Friburg in Wetteravia, a mountain townlet by the river Ussach. They stand at the two ends of the front elevation, and a stone arcade extends the whole width of the ground story. In the centre, on the first floor level, is a wooden projecting balcony. At Tübingen, in the Rathhaus there, we note an open pulpit under a roofed hood of quaint proportions, and a florid curved gable inclosing a clock dominates the centre portion of the building. Many of these buildings thus referred to are illustrated in Herr Wasmuth's delightful publication, from which our plate of Molsheim Rathhaus is taken.

THE MEISTERSINGERS' CLUB, 63, ST. JAMES'S-STREET, LONDON.

THIS building, which has just been completed on the west side of St. James's-street, occupies a site having about 50ft. frontage and 115ft. depth. The site was formerly occupied by Fenton's Hotel. The first and second floors are planned for the occupation of the Meistersingers' Club, a musical club of the same character as the Lyric, and the principal chamber in the club is the concert-room, a room about 50ft. long by 25ft. wide. The other apartments belonging to the club consist of a smoking-room, 45ft. by 24ft., small dining-room, drawing-room, and billiard-room, the usual rooms for the service of a club, and retiring rooms in connection with the concert-room. The club is reached by a staircase quite independent of the rest of the building. The ground-floor and basement have been let temporarily to the London Joint Stock Bank for their West-End branch, during the rebuilding of their premises in Pall Mall. The third and fourth floors are planned to be used or let off as bachelors' chambers, and have a separate and independent entrance from St. James's-street. The fifth floor is entirely devoted to the service of the upper rooms. The public footway leading to Blue Ball-yard runs under the south side of the building. The front, which is of Portland stone, considerably enriched by carving, has been broken up on the first and second floors by projecting bays, and on the third and fourth floors by a recessed centre. The upper floors are served by a hydraulic lift, constructed by Messrs. Archibald, Smith, and Stevens, and the carving was executed by Seale, Messrs. Colls and Sons, builders, of Moorgate-street, are the builders. The Coalbrookdale Company supplied some of the side chimney-pieces. The architects are Messrs. Davis and Emanuel, of 2, Finsbury-circus.

#### WAYSIDE NOTES.

**L**ORD HERSCHELL has taken the cream of the evidence in connection with the Board of Works Inquiry. The reports are now comparatively tame, although what may be yet divulged it is impossible to say. Many other departments of the Board have, I believe, still to be examined. The recalling of Sir Joseph Bazalgette last Tuesday did not result in anything curious, although many may think it strange that a supervising engineer should be satisfied with "sound square stocks" when "picked stocks" were particularly specified. This, however, is a point that we can understand, even if the public imagine that they have not quite had their money's worth in the new Battersea Bridge contract. So long as a brick is sound, square, and well burnt, there is nothing to be gained by constructing a wall throughout of "picked" ones. A great and new discovery this, for which the reader will give me due credit.

If the remaining evidence of the Board of Works inquiry proves to be insipid, the reader may look for some lively reports if there should be an inquiry into the working of the London School Board. The last meeting of the Board was rather stormy, individual members alluding to the "scandalous state of things that existed in the Works Department," and to the "thousands and thousands of pounds that had been squandered." Moreover, a serious charge against the late architect of the Board was made by Mr. Blousfield, who moved—"That, in the opinion of the Board, the late architect of the Board is responsible for the absence of proper footings at the Brand-street School,

Ratcliff (Tower Hamlets), and that he be called upon to make good the loss arising therefrom." I hope that Mr. Robson will immediately clear himself of this accusation, as the fault must surely lie in other quarters. Personally, I am little surprised at the incident, as I have always thought that the duties of the architect of the London School Board must be arduous at times, and prevent him giving full supervision to every building in progress. And I have further thought that the present system of employing an architect at a fixed salary is quite unsuitable for such an extensive area as that comprised in the various districts of London over which the Metropolitan School Board reigns supreme. If it be more than one can manage, it is uneconomical of the ratepayers' money; and there is certainly no doubt but that it defrauds us of much work that ought to be put out to competition. "Public money, open competitions," is my motto.

Since last noting the progress that has been made with the Imperial Institute, the Building and Finance Sub-committees have, I observe, accepted the tender of Messrs. Mowlem and Co. for the erection of the central, eastern, and western towers at eighteen thousand seven hundred and ninety-seven pounds. The total amount of the contract for the main buildings is now one hundred and sixty-one thousand five hundred and ninety-seven pounds. Work on the Imperial Institute-road has been commenced, and it is expected that it will be in a sufficiently forward state to be opened as a public thoroughfare in September.

Look out for a competition in Berlin. One day last week I observed in an evening paper that a committee had been appointed, or was about to be appointed, to consider the question of providing a cathedral for Berlin worthy of the chief city of the Fatherland. I conclude that if the idea is taken up the design will be put out to competition, though hardly an international one, as I fancy that the German is much given to Conservative principles when it comes to employing foreigners to design their ecclesiastical edifices. I do not suppose they would have a French design, even if the Parisian architects responded to an appeal for plans, sections, and elevations of proposed Cathedral at Berlin. Personal convenience might tempt M. —, *architecte*, to swallow his national pride, as, if the inhabitants of Berlin are bent on having their cathedral, it will be a pretentious building enough, and the job worth having. It will not be a "stick-in-the-mud" affair, like that at Liverpool."

Your note on the condition of Gloucester Cathedral reminds me that in *Good Words* for the current month there is a charming article on this building, by the Dean of Gloucester. It is entitled "Dreamland in History," and forms the first of a series to be given that should be read by all who love our grand old cathedrals and take an interest in their past history. Moreover, the writing is illustrated by some exceedingly beautiful vignettes by Mr. Herbert Railton. The cloisters, with their exquisite fan vaulting; the elegant Lady-chapel, the Tower, and interior of the south transept are all drawn in that feeling yet powerful style that Mr. Railton has made peculiarly his own. They show the beautiful nature of the Perpendicular work that the old builders so skilfully weaved over the original massive round-arched design. Gloucester Cathedral may, indeed, be called the birthplace of the Perpendicular style, and the monks who so successfully altered the Norman building can perhaps lay greater claim than anyone to having "invented" a new style. The Dean of Gloucester says this great undertaking was finished in 1335, or rather so much of it as is comprised in the south transept; and he concludes his pleasant essay with the following words:—"Sometimes in the late evening-tide, when all is still and quiet, when strangers and attendants are gone—when the great church is half-veiled, half-revealed in the tender grace of the long, drawn-out, soft, summer twilight—I go into that south transept, with its veil of carved stone tossed over the stern, grave Norman work, and gaze on the awful beauty which these workmen, dead and forgotten for more than 500 years, called into being. Then I think

I begin to see something of what Wigmore and his monks had in their minds when they piled their charmed stones one on the other in beautiful confusion as it seems, but really with studied order. I begin to see something of those heavenward aspirations of those monk-architects, whom the Divine and perfect Architect lodged during those long ages—(men are pleased to call dark)—in these quiet peaceful homes of prayer and thought termed monasteries." Yes, in those days they wot not of commissions, let alone those of an illicit nature. Between old church architecture and new church architecture there is a wide gulf whose span is not less than 5 per cent.

If money would produce a grand temple they should some day have one of a truly noble description in Salt Lake City. Four million dollars have been expended on a building there, and it is still far from completed.

The *Portfolio* for July continues a most instructive essay by the editor on "Book Illustration." This, the third conversation between an artist, poet, scientist, and critic, and discusses the question of "utility," and is certainly well worth perusal, as much relates to architecture and architectural drawing. The number contains a beautiful etching of Rossetti's "Ecce Ancilla Domini!" and of "A Windy Day" on what one may take to be the Zuider Zee. Among the articles is one on "Charlecote House," illustrated with some more of Mr. Railton's charming vignettes. The writer of the article, Mr. Sidney L. Lee, thrashes out the question of Shakespeare's connection with Charlecote, where, it appears, the much-abused and immortal bard practised, in the 17th century, the art of deer stealing. It is not very clear, however, whether the deer-stalking took place at Charlecote or at Fulbrooke Park, and we are at liberty to refuse point-blank to admit that the theft was committed at all.

So "Strawberry Hill" was not sold, after all. Buyers of modern-antique residences do not seem to be in anywise plentiful. The "Oaks" on Banstead Downs shared a similar fate to Horace Walpole's little vanity. Strawberry Hill, by the bye, was announced for sale as a splendid specimen of *architecture of the 15th century*, if my memory serves me right, and I do not think I made a mistake, as I cut out the announcement and put it away so carefully that it was not to be found when wanted. One would have thought that the halo of romance round the riverside building and its many associations would have insured a ready sale, even if the purchaser had a few misgivings as to the genuine nature of the architecture. There would be no confusing the architecture of the "Oaks" with that of Mediaeval times, although it is a remarkably pleasant-looking building of its kind, and charmingly situated on a pretty, shady lane on the borders of breezy Banstead Downs, from whence, it has always occurred to me, we can obtain one of the finest prospects in the country. GOTH.

#### THE NATIONAL REGISTRATION OF PLUMBERS.

**U**NDER the presidency of the Mayor of Newcastle-on-Tyne, a largely-attended public meeting was held on Monday night in the council chamber, "to consider the registration of qualified plumbers." Deputations, in most cases consisting of the mayor, medical officer of health, and town clerk, attended from the Corporations of Jarrow, Gateshead, Sunderland, North and South Shields, Durham, Darlington, Stockton, the Hartlepoons, Tynemouth, Middlesbrough, Whitby, Carlisle, Whitehaven, Kendal, Blyth, and other places.

Councillor Winter moved "That a District Council for Northumberland, Durham, Westmoreland, Cumberland, and North Yorks be formed to carry out the system of registration for that district, and that the council shall consist of master and operative plumbers and the public."

Professor Garnett seconded the motion, and gave an account of the work done in technically educating plumbers, and said he was authorised by the masters and operatives of the district to express their approval of the registration system. The motion was unanimously carried.

## "BUILDING NEWS" DESIGNING CLUB.

## A GARDENER'S COTTAGE AND FURNITURE.

NO better evidence of the popularity of our Designing Club could be deduced than the large number of contributions received for this, the last subject for competition in the present course; indeed, the interest in the several contests from month to month has been well sustained, in spite of the lead so persistently maintained at the outset by "Ghost." As at the start, so now in the final heat, he obtains the first place, which, however desirous we may have been to see others share in the honours of our class, we can but willingly accord to him. By reproducing his drawings herewith to-day in conjunction with this review our readers will be enabled, as before, to follow our remarks in detail. The instructions for these subjects were issued thus:—

K.—A Gardener's Cottage, to be used as a lodge, with carriage gateway adjoining, suitable for an entrance to a gentleman's country house of 18th century date. The cottage to comprise a living room, 16ft. by 13ft.; kitchen 12ft. square, a washhouse, larders, oven-place, w.c., ash-pit, and tool-house. An Open Porch to the cottage to form a feature in the design. Three bedrooms and store-space to be provided on the first-floor. The gate to be a wooden one, with wood posts and fence on either side. Scale, 1-6th of an inch to the foot. Elevations, section, plans, and sketch.

L.—A set of living-room and bedroom Furniture suitable for the above cottage, in varnished deal. The living-room pieces to include a bookcase-sideboard combined, 4ft. wide, 3ft. 8in. to table top, and 6ft. 3in. total height; a 4ft. 6in. circular table on tripod legs; an armchair and chimney-piece, inclosing a 15in. wide slow-combustion grate, with course of 6in. tiles round it. The bed-room suite to consist of washhand-stand, table, and 4ft. wardrobe. Scale, 1in. to the foot.

The plates now published show how the selected designs have embodied the requirements here enumerated. With so large a number of plans to notice, our critical remarks here must necessarily be brief. The style in "Ghost's" design hardly suggests quite so nearly as we intended a connection with a mansion of 18th century date. The porch and the circular window "touch in" a point of colour, no doubt, and the side windows of the living room do duty in the same direction; but, strictly speaking, the composition is not classic-like enough, considering congruity merely. As a lodge, however, there is not much to find fault with. The kitchen does not command the road sufficiently, so that the wife, when about her house duties, would hardly be so likely to see anyone outside the gates as if the arrangement of the cottage had been transposed. The entry is good and the passage is roomy, but a direct draught in front of the kitchener is a fault which the house wife would long remember "Ghost" for, and the bakery in so central a position is also a mistake. Fancy the heat in the bed-room over it, and the steam in the cottage generally, to say nothing of the inconvenience of such a plan. The w.c. would be in a warm corner, too, which would not much matter provided it were always sweet and clean, while the water would not be likely to freeze. The wash-house is good, but the bakery should have been adjoining it. Upstairs the plan is admirable. The entrance gates are not well designed for execution in wood: the arched-shaped openings look too much like masonry for our taste. "Ghost's" drawings are effectively done, and well arranged on the sheet. "Boreas" runs him, however, very closely, and for some things almost deserves to be first. For correctness of style he certainly is nearer the mark, and has given us a very pretty lodge; but on the whole "Ghost's" design is the better of the two. The porch should have been at the angle of the public highway and private road. The living room is too broken up in plan, and the entry is cramped rather. The washhouse would have been better more isolated, and the oven is awkwardly situated. The boiler, outside in the open porch, is convenient in one way, but for practical advantage the place is too small. Upstairs the rooms are well arranged. The gates are better in treatment than "Ghost's," and the small gate is a further improvement. "Uncouth Swain" is placed third, with a de-

sign studied on the lines familiar in the work of Mr. Ernest George, and drawn in his manner. The entry is very cramped, otherwise the plan is ingeniously set out, save the fact that no light can reach the landing except from below or from the open doors of the bedrooms. The cottage would otherwise make a comfortable house and a very picturesque lodge. The author has certainly improved in his work, which shows painstaking and study of good examples. "Huz" comes next, but spoils his plan by basing it too much on a villa type of dwelling—living room on one side and kitchen on the other side, with a "hall" in between. In this central distinction of plan the w.c. comes prominently in for a share, making that convenience needlessly conspicuous. The first floor is capital, with roomy chambers. The oven out of the kitchen keeps the flues together, no doubt, but otherwise is an objection. The porch is unnecessarily large, and the bay next it is too close to the greater projection, through which a view would be hardly possible. The style would not be in harmony with an 18th-century house quite. "Scottish Renaissance" tells the style of the design so distinguished, and gives us a very pretty building of a rather expensive character. We like both the elevation and the plan, which fairly well keeps to the letter of our instructions. The author should have joined our class earlier. Upstairs space is wasted by the passage-way necessary to reach No. 3 bedroom. The washhouse, bakery, and kitchen would have been improved if they had been separated. The staircase is placed in a circular tower. "Bee" has given us a diagonally-disposed plan, which has its merits, though the disadvantages preponderate in our judgment. The rooms are squarely planned, but the staircase is isolated too much from the entry and administrative part of the scheme, making too much of what ought, in so small a house, to be minimised. The drawings are fairly well delineated in brown ink. "Mayfly" drops down a stage or two in comparative merit with the funny-looking cottage, furnished with a V-shaped bay to the parlour and a timber-built store-place surmounting the porch and carried on brackets in a comical way. The gables are ugly, but the plan is rather good. "Launcelot" has sent a design which strictly follows the lines of the style stipulated in our conditions and adhering to the mode of Gibbs, Kent, or Ripley plans, the elevations with wings, central pediment, and stately blank wall spaces. The arched porch runs up into the first floor, and so lights the landing, taking at the same time all scale out of the building. The attempt has not resulted in a failure quite, and illustrates some taste, though we cannot commend the plan. The first floor is on two levels, and too much space is demanded for the "hall." The gate is out of character with the lodge. "Twig," if less mannered and more original, is hardly so good, for there is a ring of rigid propriety about "Launcelot's" design. "Twig" aims at cleverness, and succeeds in supplying a tolerably successful plan. The oven out of the kitchen jamb is a curiosity in matters of minor consequences, and the flat over the loggia-like porch, with the heraldic shield at the angle, is a poor termination to so striking a "feature." The ball on the corner of the wall only makes matters more trivial. "Apex" will have to work hard to reach the top of the ladder if this is the best he can do, with such a motto, too, as an evidence of intention. He works carefully, and we think his design shows that he means to do better. The brick built porch and brick-shaped gable we cannot admire nor compliment him on his plan, which is crude. "Spare Time Well Spent" goes in this time for the Portland cement Italian style of the "desirable residence" type, and shows his building by means of a well-drawn perspective in pen and ink. "Too consequential" is the remark naturally appropriate to this elevation from an architect's point of view; but it is not vulgar, neither does it display exactly a want of taste, and the plan is not a bad one; but the house, whatever else may be urged in its favour, is not a gardener's cottage, and that is what we asked for. Next in order ranks "Cosmos," who cannot be described as a good planner. His cottage would not be convenient, and though he gives the dimensions stipulated for, the ground-floor space is so disposed with doors and windows, borrowed lights and fireplaces, that little room

is left for furniture and comfort. His elevations look high-shouldered. "Tol Peden Penwith" has on this occasion painted in water-colours, and so finished off his picture of the cottage which bears his name. In a way this design is an improvement on former efforts, which we note with pleasure. His plan is compact, too, and convenient, though upstairs too much is made of the store place, and the passage way out of No. 2 bedroom to reach No. 3 shows want of thought. Bedroom No. 1 is over-windowed, and all for the sake of exterior effect. The lodge has nothing about it specially in harmony with a "Gentleman's Country House of the 18th Century." The designs grouped in the third order of merit are these: "Old Gold," who is better than usual, which remark means well, for he has tried his best; "H. M. S. Conway" has cramped his plan too much, and marred his elevations by the scrolls to the porch and bay. Then the oven place is absent, while the third bedroom is merely a box, and has no fireplace. "Jo's" house is ugly, and the kitchen door, first in importance on entering the external porch, is a very badly-contrived blunder. The "rustic" gate is "a terror," too. "Renaissance," "Compton," "Serge," and "Lawton" conclude the series.

Of the furniture designs suitable for this cottage "Ghost's" set is decidedly the best, and we herewith print his drawings. The bookcase-sideboard is both suitable and simple, reminding us of some Early pieces of furniture designed by Mr. C. L. Eastlake, of "Household Taste" reputation. The circular table is incorrectly drawn, and looks to be one-sided. The dressing-table is a rather original arrangement, and the wardrobe is commonsense enough, though the hanging cupboard is too short for suspending dresses in. The chair is of the High Wycombe type, and the chimneypiece will pass muster. "Boreas" is awarded the second place, and we shall illustrate both his lodge and furniture designs in an early number. His armchair is too expensive for a cottage, with its cushioned back. The tripod table we like better than "Ghost's," and the bookcase-sideboard is a practical piece, and so is the wardrobe. The washhand-stand and toilet-table are combined in one article, and the chimneypiece would look very well in execution. With these remarks our notes close for the BUILDING NEWS Designing Club, session 1887-1888.

## ASSOCIATION OF MUNICIPAL ENGINEERS.

THE 15th annual meeting of this Association was held on Thursday, the 12th inst., at the Institution of Civil Engineers, under the presidency of Mr. E. B. Ellice-Clark. The annual report showed that there were 349 members, representing the principal towns throughout the country, and there was a credit balance of £369 1s. 9d. The President in his address suggested that technical classes for sanitary engineer students should be established in connection with Owens College, Manchester, Mason's College, Birmingham, the Yorkshire College, Leeds, and similar colleges in the provinces. Referring to the work yet to be done by sanitary engineers, he expressed the opinion that there were more than 375,000 houses in London of over £100 annual value in which new drainage works were absolutely necessary. A similar state of things existed to some extent in every provincial town. Much required to be done in connection with the arterial drainage of towns, the prevention of floods in the great river valleys, and to further improve the sanitary condition of towns. The method of obtaining heat in dwelling-houses was only one step removed from the consumption of fuel in an open hearth in the tent of the savage. One-half of the effective value of fuel was wasted and the air of cities polluted. The manufacture and distribution of non-luminous gaseous fuel for heating purposes from a central station was not very far distant. By this means air pollution would be prevented, and there would be no cinders or ashes to be removed from houses. There should be no difficulty in designing such a stove, fed by gaseous fuel, as would in every house consume the decaying matter which now formed the bulk of house refuse. He also advocated a State college, or permanent commission, for making original scientific research, and held

that enormous sums would have been saved if even only the disposal of town sewage had been dealt with by such a competent body. Alluding to the Local Government Bill, he expressed great regret that it did not provide for such a readjustment of areas as he thought the exigencies of the case demanded. Papers were read by Messrs. H. U. Mackie, of Carlisle, and E. R. Strachan, of London, after which a visit was paid to the new drainage and ventilation works at the Houses of Parliament, and in the evening the annual dinner took place.

The meetings were reopened on Friday, Mr. E. B. Ellice-Clark again presiding. Lieutenant-Colonel Jones, V.C., read a paper giving 10 years' experience of the "Shone" ejector. Examples were given, including instances at Eastbourne, Henley-on-Thames, and Fenton, Staffordshire, where the system was working satisfactorily. In the course of a long discussion on the paper, the opinion was generally expressed that the "Shone" injector for ordinary purposes of pumping was not equal to existing methods on the score of either efficiency or economy. It was admitted, however, that it is useful under some exceptional circumstances, though it was strongly urged that no reliable data had been given of the actual cost of working the "Shone" in any of the places named. Mr. de Courcy Meade, of Hornsey, read a paper describing the electrical fire-alarm arrangements adopted in that district, and Mr. William Webster, F.C.S., read a paper describing the decomposition and purification of sewage by means of electricity. He passed a strong current of electricity through sewage before the meeting, and the solid matter speedily rose to the surface, leaving the fluid apparently bright. He also exhibited a sample of effluent water eight months old, and also a specimen of disinfecting fluid obtained from sewage 12 months ago. The chief expense, he stated, was the engine power, and the process could be applied to any existing tanks. Several speakers considered the process likely to be productive of great results, provided it could be economically applied to the treatment of large quantities of sewage, as the analysis submitted showed the effluent water to be absolutely free from suspended matter.

#### BRISTOL AND GLOUCESTERSHIRE ARCHÆOLOGICAL SOCIETY.

THE thirteenth annual meeting of this society commenced at Gloucester on Monday and extended to yesterday. The proceedings commenced under the presidency of Lord Sherborne, the retiring president, who introduced the president-elect, Mr. R. V. Vassar-Smith, ex-mayor of Gloucester. The President-Elect read his inaugural address, which had reference to the muniments of the Gloucester Corporation. In the afternoon the Dean received the members in the Chapter-house. The party then divided into three sections, and were taken over the building under the guidance of Mr. F. W. Waller, architect, who pointed out its various interesting features, architectural and otherwise. Subsequently the visitors were taken over the deanery.

A meeting was held at night at the Tolsey reading and discussing papers. Among these Mr. Henry Jeffs read a paper on the "Mason's Square and Masons' Marks." These abound at Gloucester, where there is also, in the south transept, a curious monument in the form of a mason's square, and underneath it figures of a man and a boy, the former having mason's tools in his apron. Tradition says that this is the monument of one John Gower, who was employed in converting the Norman work of the transept into Early English, and that he killed the boy, who was his apprentice. Mr. Jeffs showed that neither the modern fraternity of Freemasons, nor the lodges of Mark Masons, had anything to do with the masons' marks in buildings. He owned that these marks were to be found in ancient buildings in Egypt, on the Pyramids, in Greece, throughout Europe, and in Mexico, Peru, &c., while some of those in Gloucester Cathedral resembled the marks found in Carthage and in the Egyptian hieroglyphics. He suggested that these marks, which had long formed an enigma apparently not to be solved, were nothing more than marks made by the workmen, just as used to be and

was still the practice for workmen in the porcelain manufacture to put a mark on their products. He considered that the modern trade mark was simply an imitation of these masons' marks, and that many of the marks on old stones in our churches were cut by the workmen as a pastime, as men nowadays cut their names in oak benches.

Mr. Henry Medland, architect, had prepared a long and interesting paper on "St. Oswald's Priory, Gloucester." The earliest presumed foundation of this institution was given as about 660; but the more generally received account was that it was founded in 909, by Ethelred, Prince of Mercians, and his wife Ethelfleda, daughter of Alfred the Great, in honour of St. Oswald, king and martyr. Mr. Medland gave an outline of all that is reported of Oswald, traced the history of the priory, and showed that at the dissolution the seven canons who then occupied the priory were sent forth to the world with 16s. 8d. divided between them. The south aisle of the priory church became the parish church of St. Catharine, but at the siege it was greatly damaged, and the Parliament gave the building to the corporation, who used the roof and part of the material in the erection of a barley market in another part of the city. What remains of the ancient church is now a beautiful ruin, and, thanks to Mr. Medland's care, many fragments of the old priory are built into it. The other part of the priory has entirely disappeared, and some of the estates were given by King Henry VIII. to the Dean and Chapter of Bristol. One most interesting feature of Mr. Medland's paper was an account of the discovery by him, a month ago, of a beautifully sculptured stone, bedded in a wall adjoining the priory. This stone evidently formed the shaft base of a churchyard cross; the sculpture is Celtic in character, and it is suggested that it formed part of a memorial to St. Oswald, and was the work of an artificer from Iona or Lindisfarne.

#### PRACTICAL ARCHITECTURE WITH DETAILED ESTIMATES.—II.

By HENRY LOVEGROVE, F.S.I., Surveyor.

11. **MORTAR.**—The mortar to be composed of one part of freshly-burnt grey-stone lime of good quality to three parts of clean sharp sand (no mould or screenings to be used); the whole to be mixed in a mill or on a boarded platform. Good well-burnt ballast may be used, but the proportion must not exceed one-third to two-thirds of sand.
12. **Cement.**—The cement to be the best Portland cement from an approved manufacturer, one part to be mixed with three parts of clean Thames sand.
13. **Bricks.**—The whole of the brickwork is to be done with hard well-burnt grey stocks, laid with a proper bond, and well flushed up every four courses, no four courses to rise more than 12in.
14. **Facings.**—The external faces to be of the best red bricks from Messrs. Lawrence, of Bracknell, properly bonded, and with neatly-ruled weather-joints. The pends to be properly kept, and all reveals to be truly worked.
15. **Dampcourse.**—Lay in all walls, at the level of 6in. above ground level, two courses of slates laid to break joint in cement.
16. **Arches.**—The arches to be of good rubbers, gauged, set in putty, and pointed. The skewbacks to be as slight as possible. Turn half-brick trimmer arches in cement to all the fireplaces above the basement. Turn roughly-axed discharging arches over all door and window openings, those in internal walls to be the full thickness of the walls, and to spring from the ends of the lintel.
17. **Vaults.**—The vaults where shown to be in two half-brick rings.
18. **Walls.**—Lay in the footings with regular offsets, two courses to one brick, and three to the brick-and-a-half walls, and carry up the walls to the heights and dimensions shown on the drawings.
19. **Half-Brick Walls.**—All internal partitions which have not false bearings are to be of half-brick in Beart's solid bricks, set in cement.

20. **Sleeper Walls.**—Build proper fender and sleeper walls in basement, with two oversailing courses to take sleepers.
21. **Chases.**—Leave chases for soil and other pipes; cut all spalls, skewbacks, chamfers, and all other cuttings; bed all stone or wood lintels or templates; bed and point up in lime-and-hair mortar all down, and window frames.
22. **Cuttings.**—All skewbacks and other fair cuttings to be neatly executed.
23. **Weatherings.**—The four top courses of all chimney stacks to be set in cement, and all sailing courses and other external projections are to be weathered in cement.
24. **Copings.**—All walls for which a stone coping is not described (or shown) are to be finished with hard stock bricks on edge, and double tile creasing, all in cement.
25. **Wedge and Point.**—Rake out joints of flashings, and neatly point in flashings in cement.
26. **Flues.**—The flues to be very carefully carried up; pargetted with cow-dung mortar, and properly cored at the completion of the works.
27. **Chimney Bars.**—Put 2in. by 3in. wrought-iron chimney-bars (3in. by 3in. to kitchen), and 18in. longer than the openings, the ends split and turned up and down to all chimney-breasts with a relieving arch over same.
28. **Setting Stoves.**—Properly set the kitchener and the whole of the register stoves throughout the building.
29. **Fenders, &c.**—Fill in the fenders and over the trimmer arches with concrete; also to haunches of the arches.
30. **Chimney Pots.**—Provide 9in. drain pipes as chimney-pots, to stand 6in. above the top of brickwork, set and flanchied with plain tiles and cement.
31. **Limewhite.**—The walls of basement, except kitchen passages and breakfast room to be finished with a fair face, and twice limewhited, the colour to be fixed.
32. **Paving.**—The basement floors, not specified to be of wood, to be finished with Portland cement paying lin. thick, trowelled to a smooth face on 6in. concrete. The larder, scullery and cooler to be paved with 6in. square red tiles, bedded and jointed in cement on 6in. bed of concrete.
33. **Air Bricks.**—Provide and build in where directed No. 24 terracotta air bricks, 9 by 3, with short flues through walls.
34. **Ventilators.**—Provide and fix No. 8 Kite's patent ventilation inlet and outlet, 15s. p.c. each.
35. **Chimney-Pieces.**—The chimney-pieces in kitchen and scullery are to be formed in Portland cement, with jambs 9in. wide, and deal shelves 9in. wide and 1½in. thick, on proper brackets. Assist, when necessary, in fixing the chimney-pieces.
36. **Sink.**—Provide and fix in the scullery a glazed stoneware sink 3ft. 6in. by 2ft., on half-brick walls in cement.
37. **Generally.**—The bricklayer is to attend upon all other trades, to cut away when and where required, to point round plumbers' work, carefully stop putlog holes, examine brickwork throughout, and leave all brickwork and joints perfect. (Notes.)

#### EXCAVATOR.

Make a collection of the length of walls, and take by width and depth of concrete, which will give dimension of trench digging and concrete.

156.9	Dig and cart and concrete to
4.0	external walls.
1.6	

Then the odd walls and projections, casting up the squarings in each column so as to reduce the number of figures in the abstract, and we thus arrive at the dimensions, 1191'3 and 593'8.

Next take the same length :—

156.9	Dig and cart, part return, fill
4.0	and ram (followed by the other
1.0	walls as before).

Take the surface digging :—

50.9	Dig and cart to surface (and com-
41.3	plete the entire area of surface).
1.9	

Measure all the cement and tile pavings by the foot super., and take the filling-in under pavings by the foot cube.

Beattie and Son, and plans have been prepared (in competition) for another library—that of the solicitors to the Supreme Courts. The three great legal societies of Advocates, Writers to the Signet, and Solicitors will thus be each provided with its own library. The two former bodies have both been long in possession of the best collections in the country, and the public have always been generously allowed the use of them for any references, all that was required being a letter of introduction from a member. The site obtained is in the Cowgate, and any architectural display on the frontage of such a narrow street would be lost. Something, however, will be possible to make it out as a building of importance in treatment of the roof and upper story. About twenty-five plans have been sent in, and the assessors, Messrs. Burnet and Son, of Glasgow, have selected, as you mentioned last week, the design by Mr. J. B. Dunn, of George-street, Edinburgh.

The National Portrait Gallery continues, as it has done for months, to present the same unfinished aspect; but preparations are making to complete the building at its two extremities. The appearance hitherto has not been such as to give a very favourable impression of the architectural design, as an addition to the appearance of the street. It is impossible to get quit of the idea that, both in construction and proportions, it is only a huge warehouse, with a great monotony of arrangements in its windows and arches, unrelieved by any of the variety which is essential to a Gothic building of such magnitude. Probably this circumstance may have had the happy result of increasing the generous contribution of the donor, and the architecture of the finished whole will doubtless obviate, if not altogether, yet in some measure, the objections to what may be defined as the Noah's-Ark-like aspect of the work.

The large board schools in Torphichen-street and Johnstone-terrace are finished, or nearly so. They have both, and especially the former, been erected on sites somewhat awkwardly confined for such buildings; and the result has been happy, in as far as the architectural appearance of the exterior is concerned. Though a large number of these schools have been built, there is no sameness in the style, and the somewhat pronounced Gothic of the first board schools has been succeeded by a return to the Classic or Domestic style. The two schools just completing are very different, but each adapted with great skill to their position and neighbouring buildings. The interior of the Torphichen-street hall and staircases, which are finely lighted by cupolas, is imposing by its extraordinary length. The rooms on the side are *en suite*, and can all be opened from end to end. Shorland's school grate is generally in use, and great attention paid to the thorough lighting and ventilation of the crowded rooms.

The new buildings of the University will be now completed with the erection of the hall and tower, plans, in preparation by the architect, Dr. Anderson, being nearly ready for taking the usual estimates of the cost; this having been undertaken by Mr. McEwan, M.P., who has already given so largely to the scheme.

The Students' Union is well forward towards completion, and the view given lately in the BUILDING NEWS is a faithful representation of its character, the style being something between the French chateau and the Tudor castle. At present the principal front is buried somewhat by some adjacent buildings in Bristo-street, which should be swept away.

Edinburgh has had another added to the list of its statues in the monument recently erected to the late Duke of Buccleuch. It is on a larger scale and loftier pedestal than the others, and the site selected, near the west door of St. Giles Church, is in some respects an awkward one. The figure is admirably posed, from every point of view, and is, no doubt, an excellent likeness; but this unfortunately, is invisible, like all the bronze sculpture, till the sun lights up the surface which it does not do till the afternoon. The Duke is looking to the north, and turns his back on the southern border land, with which his name and that of his ancestors is most intimately associated. Possibly no other position could well be given to this statue; but there is less to be said in defence of the mistake which

Carried to summary.....

**CORRECTION.**—On page 36 I used the word "Blenkner" instead of "Bartholomew." It was the work of the latter which Mr. F. Rogers took as the basis of his book in 1873; but in a later edition (1886) the work was so entirely remodelled that very little of Bartholomew remains. I also ignored Dobson's "Student's Guide to Measuring and Valuing," which has been considerably improved by Mr. E. W. Tarn, M.A.

#### ROOF VENTILATION DURING SUMMER.

THE disfigurement caused by some forms of ventilators on the ridges of roofs has been one of the reasons why architects have not introduced these kinds of outlet more generally in buildings. As we have maintained, there is no reason why they should not be made to assist the sky line by inclosing the plates in well-designed turrets with good outlines. Cheapness has been detrimental to artistic ventilators of this class, and all kinds of inferior imitations are put up, more apologies than efficient exhausts. The "concealed roof ventilator," such as that patented by Robert Boyle and Sons, in which the deflecting plates are placed within the roof, with openings on each side just below the ridge, remove the objection to the external form, and, it appears to us, are particularly well suited for the nave roofs of churches. During the close summer season the evening services in our churches are very enervating, and in crowded town churches it is not unusual to see persons leave the service, and many ladies taken out in a fainting condition. The reason is not far to seek. It will be found that no means of outlet for the heated and vitiated air has been provided under the hot slates. The whole space of the open-timbered roof forms a receptacle for the respired air, which the open windows fail to remove. The vitiated atmosphere thus stored descends when the roof becomes cooled in the evening, to be rebreathed. The concealed roof ventilator is one of the simplest and least costly means of providing escape for this pent-up air, and when there is

should make it compulsory that every open-timbered church roof should be provided with two or three of these concealed ventilators, and then we shall have fewer cases of headache, lassitude during service-time, and of persons leaving the congregation from feeling faint, or from sheer inability to remain in a stifling atmosphere, or exposed to cold draughts from open doors and windows.

#### NOTES FROM EDINBURGH.

NO change for better or worse can be said to have marked the course of the half-year so far as the building trades are concerned. The city is still extending to south and west, the demand for suburban and semi-rural dwellings being apparently still unsatisfied. The desire for such residences, characteristic of the growth of modern towns everywhere, has doubtless had an immense impetus given it by the diffusion of the ordinary information and statistics of mortality in connection with sanitary matters, &c. The tendency to over-populate the towns and the depopulation of the country have made people naturally seek to escape from the evils of overcrowded districts, the noise and smoke and doubtful atmosphere of the city, to the suburban villa, with its garden ground and sky. The scheme is practicable for the ordinary householder only by reason of the great facilities of transit afforded by the rail and tramway. The mushroom-like rapidity with which such suburban buildings cover the ground, and the large proportion they bear to the compacter portions of the city, is very apparent to anyone from lower altitudes than that of Arthur Seat. At present the popular field for this emigration is, as for years past it has been, the southern and south-western districts. The outermost buildings of this extension are now climbing the slopes of Pentland range, and the distance from the business heart of the city must be measured by the mile. The district is credited with a much milder temperature than that of the valley lying northwards. But it has been ascertained that the average temperature of the neighbourhood of Stockbridge is only 2 degrees below that of Morningside, and the temperature of the higher lands on the south cannot fail to be affected by loss of the shelter from the east wind afforded by Arthur Seat and the Salisbury Crags. A splendid field for the speculative builder lies ready for occupation on the north, in the grounds mostly belonging to the Fettes Trust, where the air, whether the wind blows east or west, is always pure, from the mountains or the sea. The most of it is within wholesome, if not very easy, walking distance from the business centre of the town, and the northern tramways, when extended, will put it in respect of facilities of transit, on a par with the southern suburbs. There seems nothing impracticable in hoping for the time when blocks of country cottages, as well as country villas, may be a safe speculation for the suburbs.

The heavy under-building of the Free Library is making good progress under the hands of the energetic contractors, Messrs.

has been made in placing the Ramsay Memorial Cross so as to face the north, instead of in its natural and canonical position, facing east and west. The consequence is that the bronze sculpture on the shaft, which is the best part of it, is hopelessly illegible for the greater portion of the day; whilst the form of the monument itself—a Celtic cross—would have been seen from a much greater distance, and would have been more noticeable had the ordinary position been maintained.

The Buccleuch Monument, as a whole, has far too much stonecutting and filigree ornament in bronze work for a monument in the open street, and such a public thoroughfare. The stags couchant at the corner, &c., will run fearful risks if they are to survive another century. The whole is covered with bronze panels of incidents, historical and private, which only perplexes the spectator—not easily legible—and miniature racers, like good-sized rats, are chasing each other round the feet, giving the design far too much of the silversmith's trophy; in contrast with the simple and severe outlines of the principal figure.

Nothing very noticeable has been done in the way of alterations in the chief thoroughfare of the city. Extensive improvements, mostly internal, have been made on the Clarendon Hotel, and the Edinburgh, which had begun to look squat beside its loftier rivals, has overtopped them all by its late addition of a story and Mansard roof, with a huge *pièce de résistance* in the shape of a four-sided pyramid in slate surmounted by a flagstaff turret.

The negotiations for purchase of the gas companies have been successfully completed, after long discussion of the scheme, and the citizens, it is to be hoped, will have cheaper, if they cannot expect better, light. The water supply, though abundant, has not improved under the city management, and imperfectly constructed filters have not infrequently allowed water with much mineral and vegetable impurity to find its way into the houses. The impurity forces itself on the notice by green deposit on the water-bottles. People are even wishing for St. Mary's Loch, but probably the "fleas" and other insects of that source of supply might be no better, and less easily remedied as a nuisance.

#### AMERICAN SCHEDULE OF CHARGES.

THE American Institute of Architects have endorsed the schedule of professional charges adopted by the Western Association of Architects, which will be found to agree in the main with that adopted by English architects. The following is the text:—For full professional services, including supervision, the commission is five per cent. upon the cost of the work. The charge for partial services is as follows:—Preliminary studies, 1 per cent.; preliminary studies, general drawings, and specifications, 2½ per cent.; preliminary studies, general drawings, specifications, and details, 3½ per cent. For works that cost less than 10,000 dollars, or for monumental and decorative work and designs for furniture, a special value in excess of the above; for alterations and additions, an additional charge to be made for surveys and measurements; an additional charge to be made for alterations and additions in contracts and plans, which will be valued in proportion to the additional time and services employed; necessary travelling expenses to be paid by the client. Time spent by the architect in visiting for professional consultation and in the accompanying travel, whether by day or night, will be charged for, whether or not any commission either for office work or supervising work is given. The architect's fees are successively due as his work is completed in the above classifications. Until an actual estimate is received the charges are based on the proposed cost of the works, and the payments are received as instalments of the entire fee, which is based upon the actual cost. The architect bases his professional charge upon the entire cost to the owner of the building when completed, including all the fixtures necessary to render it fit for occupation, and is entitled to additional compensation for furniture or other articles designed or purchased by the architect. If any material or work used in the construction of the building be already upon the ground or come into possession of the owner without

expense to him, the value of said material or work is to be added to the sum actually to be expended upon the building before the architect's commission is computed. This regulation of the charges is generally followed in England; the schedule adopted here does not define what is reasonable for preliminary sketches, which is left to the architect in each case. We shall be glad to hear how the schedule adopted by the Western Association is found to work in actual practice.

#### UNIVERSITY COLLEGE, LONDON.

##### CLASSES IN ARCHITECTURE.

THE following prizes and certificates have been awarded:—

Fine Art: Donaldson Silver Medal, E. A. Runtz, of London. Certificate, 2, Alan C. Walker, of Tasmania. 3 and 2nd Prize, Harold R. Luck, of London. Second Class: B. F. Fletcher, of London; J. W. Little, of London; P. D. Smith, of London. Third Class: M. A. Green, of Bath; E. A. Williams, of Upper Norwood; F. E. Williams, of London. Construction: Donaldson Silver Medal, Horace Helsdon, of London. 2nd Prize, Harold R. Luck, of London. Certificates, 3, Alan C. Walker, of Tasmania. 4, Wm D. Claridge, of London. 5, J. W. Little, of London. 6, J. Borrowman, of Godalming. Second Class: A. W. Carne, of St. Agnes; M. A. Green, of Bath; E. C. Hanson, of London; H. C. Lander, of London. Third Class: A. Sealy-Allin, of co. Cork; E. Finch, of Southampton; A. G. Turner, of Anerley; E. A. Williams, of Upper Norwood; F. E. Williams, of London. Modern Practice:—Prizes, equal: Gordon P. G. Hills, of London; Alan C. Walker, of Tasmania. Certificates, 3 equal, Harold R. Luck, of London; Oscar Oertel, of London. 5, E. A. Hellicar, of Bromley. Second Class: E. A. Williams, of Upper Norwood. Third Class: M. A. Green, of Bath; H. Lazarack, of Aldershot; W. W. Wilson, of Leytonstone.

Professor Roger Smith's prizes for drawings illustrative of the work of the classes were awarded as follows:—Fine Art Prize divided between E. Runtz and A. C. Walker; Construction Prize divided between John Borrowman and H. C. Lander.

#### COMPETITIONS.

EDINBURGH. — CHAMBERS MEMORIAL STATUE.—The report by Mr. Brook, A.R.A., the assessor on the designs for the Chambers memorial statue, has been adopted by a committee of the Edinburgh Town Council. The awards are as follows:—1, "Nothing Hazard Nothing Have," by Mr. John Rhind; 2, "St. Columba," by Mr. W. Birnie Rhind; and 3, "Fiat Justitia," by Mr. J. Massey Rhind. In the successful model, the right hand rests on the thigh and holds back the civic robe, while the left comes in front to support, on the upper half of the left limb, the municipal cocked hat. The pedestal exhibited shows panellings with symbolical figures of "Perseverance," "Industry," "Liberality," and "Literature." It is suggested that it should be in red Corsehill freestone, with granite steps. If it is wished to be in granite, the details could be modified. The conditions of the competition, it will be remembered, were that the author of the design judged first in order of merit was to be employed to carry the work into execution; and premiums of £50 and £25 are to be awarded to the authors of the designs judged second and third in merit respectively. The pedestals of the three statues of Messrs. Rhind have been executed from designs prepared by Messrs. Blanc and Gordon, architects, George-street, Edinburgh.

#### CHIPS.

The Morecambe Local Board having applied to the Local Government Board for sanction to borrow the sum of £9,000 for works of promenade and street improvements, &c., Major-General C. Phipps Carey, R.E., Inspector for the Department, held an inquiry into the subject-matter of the application on Wednesday.

Alterations and repairs are now proceeding at St. Luke's Church, Wolverhampton, comprising structural alterations, heating with low-pressure hot-water pipes, and ventilation. The whole of the works are being carried out under the superintendence of Mr. Joseph Lavender, A.R.I.B.A., of Wolverhampton, who has adopted Messrs. C. Kite and Co.'s system of concealed roof ventilation.

The western end of the parish church of St. Mary, Bridgwater, was reopened on the 12th inst. after having been opened up and renovated. The total cost amounts to £1,200. The architect was Mr. Geddings, and Messrs. Trask and Sons, of Ilminster, were the builders.

#### ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—The annual general meeting of this association was held on the 5th inst., in the Architectural Hall, George-street, Mr. Hippolyte J. Blanc, president, in the chair. The secretary (Mr. T. Fairbairn) submitted the annual report, which contained the record of a year of successful work by the association. During the year the association had added 34 members to its roll, while the withdrawals had been considerably less. The treasurer (Mr. Whitelaw) submitted the financial statement, which showed a balance in favour of the association amounting to £146, compared with £170 last year. It was explained, however, that there had been £36 of extraordinary expenditure on account of the furnishing of the new hall and additions to the library, so that the association was financially in as good a position as last year. Reports submitted on behalf of the sketchbook committee by Mr. Gordon, and the work class committee by the President, indicated continued success. In the work class there had been 23 students, whose work, and the quality of it, showed an advance on the previous year, and prizes gained at the class, and in connection with the sketchbook competition, were presented in the course of the evening. Professor Baldwin Brown was elected president for the ensuing year, with Mr. Blanc as past-president; Mr. John Kinross and Mr. Archibald Macpherson were appointed vice-presidents. Mr. T. A. Fairbairn was continued in the office of honorary secretary, and Mr. A. D. Fairbairn was appointed treasurer. The retiring president then delivered his address, in which he reviewed the work of the session. In speaking of the work classes, he pointed out how invaluable these were as a supplement to the work of the office; and he thought it was a matter of credit that with so little encouragement so much was being done, and so well. The number of students attending the classes was increasing, and they were a fit subject for special effort to secure external help for their endowment. The other leading topic in the address was the subject of registration, and Mr. Blanc argued that the architect could not be brought to the level of test examination. There were, doubtless, minor qualities which went to make up the architect which could form the subject of academic test, but registration could not invest the constructor in the garb of an artist. Architecture should be free, if it would have a healthy, vigorous growth, and in that view it seemed unnatural to make it a close profession. In closing, Mr. Blanc spoke of the greatness of the architect's profession, which had raised monuments which time itself seemed powerless to destroy. It was fortunate that the art was being fostered again under somewhat favoured conditions; for there was an increasing section of the community which had risen to a sense of healthy artistic feeling which was daily increasing. It was for them accordingly to enlarge that appreciation through the means of their profession.—On Saturday last, the association had their annual excursion, the locality selected being the East Neuk of Fife. There was a large muster of the members of the association and their friends, and the party, after reaching Leith, proceeded by steamboat to Elie, from which point the journey was continued in conveyances to St. Monan's Church, where they were received by the Rev. Mr. Turnbull. Notes were read by Mr. Hippolyte J. Blanc, on the edifice, which was described as an example of the "Middle Pointed period" of Gothic work in Scotland. Its foundation, it was explained, was attributed to David II. in 1369. It had become ruinous during the 18th century, but had been restored to its present condition in 1828 by the late William Burn, architect. The edifice consisted of choir and transepts, without nave, and central tower and steeple. The company resumed their drive to Abercrombie Church, a simple rectangular building, with any features remaining quite obscured with ivy. The antiquity of the edifice was, however, as Mr. Blanc explained, verified by scattered pieces of carved stones in the patched-up ruin. Balcaskie Castle was next reached, and was described by Mr. Blanc as a fair type of the average mansion of the 18th century. On Kellie Castle notes were read by Mr. Lorimer.

## Engineering Notes.

**CONCRETE WORKS AT ABERDEEN HARBOUR.**—Mr. Philip J. Messent, M.Inst.C.E., Tyne-mouth, submitted a report on Tuesday to the Aberdeen Harbour Commissioners on the quay walls and the repairs which have just been completed in the graving dock. He states that the concrete in the walls, from 11½ ft. below to about 3½ ft. above low water, was executed and deposited on what is termed the "plastic system." This mode of using concrete is of comparatively modern introduction, and is, Mr. Messent says, at variance with the long-adopted practice of engineers and their opinion that cement, concrete, or mortar, when it had once commenced to set, was injured or deteriorated by being disturbed, and was so prevented from ever attaining strength, such as it would have attained had it been undisturbed. In a paper by the author or inventor of the system describing certain experiments, he says that they "show that 3½ to 1 concrete, after setting out of water for 18 hours, and then rammed into moulds, will form a monolithic mass when afterwards placed in water; but the strength of this mass will very much depend upon the time allowed for setting before deposition. If only eight hours elapse between mixing and deposition, there is practically no reduction in strength, but with a longer interval the strength is gradually reduced, until, at about 18 hours, it is little more than one-half." Mr. Messent's experience is not confirmatory of the above, and he believes that a considerable reduction in the strength of concrete will result if even less "than eight hours elapse between the mixing and deposition." The engineer states that it appears probable the submerged portion of the wall has not suffered from the chemical action of the sea, but he regrets that this most probable assumption has not been indisputably verified by chemical analysis.

## Building Intelligence.

**ESSENDINE.**—The curious and interesting little Norman church at Essendine was reopened on Friday, after restoration under the supervision of Mr. Traylen, diocesan architect, Stamford. The church, which is built within the precincts of what was once a double-moated castle, consists of chancel and nave and turret with two bells, and is a small building. It was repaired in 1835 and 1845. The most ancient part about the church is the south doorway, of the time of Henry I., the tympanum of which contains three carved figures—our Saviour, with His left hand resting on a book and the other raised in the attitude of benediction, and on each side of Him angels, with hands lifted in the attitude of worship. On the right hand of the central figure are the letters "I.H.C." The jambs of the door are also richly carved: there are monkeys beneath a tree, an owl, a stag, and other figures nearly effaced. Drawings of the doorway have often been made, and it is illustrated in the *Glossary of Architecture*. There is also some Norman carved work placed horizontally over the north door. The chancel arch is curious: it contains Norman details, but the arch itself is pointed. The present work comprises the lowering of the floors of the nave and chancel a foot, paving with stone in the passages and with wood block flooring under the seats, removing a buttress at the west end, opening out a narrow lancet Early English window which had been blocked up thereby, taking down the entire west wall with the belfry, and rebuilding it stone for stone with its characteristic double bell gable. Faint traces of painted decoration were found on the ancient plastering, which have been preserved. The ground at the west end has been lowered about 3 ft. The old square box pews have been cleared away, and new seats provided. The font has been placed on a step, and the old cover cleaned and replaced. The stonework of the windows and arch has been removed, and new woodwork to the north and south doors provided. An organ has been built by Messrs. Bishop and Son, of London. Mr. John Spurr, of Belmistrorpe, has done the general builder's

work in the church, and Mr. Fenn, of Ryhall, executed the woodwork.

**LONDON SCHOOL BOARD.**—At the meeting last week of the Board a heated discussion arose on a statement by Mr. Gover that another member, Mr. Helby, had stated that "matters were quite as bad, or worse, at the School Board than at the Metropolitan Board of Works." Mr. Helby, in justification, stated that if Mr. Gover had looked into the matters before the Works Committee he would have found that the ratepayers had, through the Board, paid for what they had not received in the matter of foundations to school buildings. He did not mean to say that this was attributable to members of the Board, and he did not impugn the honour of members of the Board; but he said that those who took the position of membership of the Board should watch over the interests of the ratepayers, and if they had all taken the interest in the Board's work thousands of pounds would not have been paid without value being received for the payment. Mr. Gover moved that a special committee be appointed to investigate any allegations of corruption affecting any member or officer of the Board and report. This was carried by 21 to 10 votes. Mr. Bousfield moved, as chairman of the special committee on the work of the works department—"That, in the opinion of the Board, the late architect of the Board is responsible for the absence of proper foundations at the Brand-street School, Ratcliff (Tower Hamlets), and that he be called upon to make good the loss arising therefrom." This was carried by 17 to 10 votes.

**MAPPLEBOROUGH GREEN, STUDLEY.**—The Church of the Holy Ascension was recently opened by the Lord Bishop of Worcester. The church has been erected at the cost of Mr. William Jaffray, in memory of his wife. The building, which is from the designs of Mr. J. A. Chatwin, of Birmingham, and has been erected under his superintendence, is Early English of the purest type. It consists of nave, 48 ft. 8 in. by 21 ft., and 40 ft. high; chancel, 32 ft. 6 in., and 36 ft. high; north and south aisles, 48 ft. 8 in. by 6 ft.; and north and south chancel aisles, each 15 ft. by 10 ft.—that on the north being an organ chamber, and that on the south a memorial chapel. At the west end is a tower, 21 ft. in the square and 70 ft. high, with a belfry turret on the north side. The entrance is by a deep oak porch on the south side, closed by an oak door, with floriated hinges in wrought iron. The materials of the building are Bromsgrove stone for the exterior, and for the interior Hasbury stone, with Bromsgrove stone dressings; the space between the walls being filled with concrete, in which a so the floor is bedded. The woodwork throughout is of oak. The roofs are tiled. The nave is divided into four bays, with circular and octagonal columns, alternately, having moulded caps and bases. The aisle windows have traceried heads. The roofs of the nave and aisles are trussed and rafted; in the aisle roofs the principals rest upon bracket corbels, and at each end the nave arches are finished with string courses terminating in carved corbels. The sitting spaces in the nave—to receive 120 chairs—are laid with wood blocks; the rest of the floor throughout is of red Ruabon tiles, with a narrow edging of black tiles. The aisle windows are filled with cathedral glass. The chancel is separated from the nave by a low stone screen, enriched with a band of carved work; at the north side of the screen is placed the pulpit, which is of oak open work, decorated with carving, and resting on a stone base, forming part of the chancel screen. The chancel is raised three steps above the nave, the sacrum rises again three steps from the chancel floor. On each side of the chancel are oak stalls, with carved ends, for clergy and choir. On the south, by the side of the altar, are sedilia and a credence table, with piscina, recessed into the wall. The east window is a triple lancet, and filled with stained glass, the subject being the Passion of Our Lord. The east window of the Memorial Chapel is also filled with stained glass, illustrating the text "Now abideth Faith, Hope, and Charity, these three; but the greatest of these is Charity." These windows, designed by Mr. John Powell, were made by Messrs. Hardman and Powell, who have also executed the metalwork in the church. The carving in stone

and wood has been executed by Mr. R. Bridgman, of Lichfield, and the organ is the work of Messrs. Nicholson and Co., of Worcester. The builders are Messrs. John Smallwood and Sons, of Wootton Wawen.

**NEWCASTLE-ON-TYNE.**—Services in connection with the dedication of the new building which has just been added to St. Matthew's parish church, Summerhill-place, Newcastle, and the reopening of the church after enlargement have just taken place. The building is of unusual plan and arrangement. It stands on an awkwardly shaped piece of ground, which will be almost entirely covered when the church is completed. It consists of chancel and nave, under a continuous roof, with western tower, and two aisles on each side of the nave. The Bishop of Durham, in consecrating the church in 1880, described it as "a fragment." At that time the only permanent roof was that over the sanctuary, and although four of the pillars were built, they supported a roof of the commonest and most temporary character. Two years ago the contract was signed for the work now completed. This comprises the construction of aisles and clerestories, on each side, and the making of the permanent roof, all of which was done from the outside, while the regular services in the church proceeded without interruption. When the work was completed, the dividing walls were taken down, and the old and new portions joined together; and during the few weeks that this has occupied the church has been closed. The whole lower stage of the tower is built coming out to the street. The west window is of five lights, with tracery, and on each side there is a continuous clerestory of twelve two-light windows, and a second clerestory to the inner aisle. The font stands elevated on marble steps in the centre of the base of the tower, and a dwarf screen of stone has been put up to enclose the western end of the chancel. The western bays of the aisles still remain to be built before the ground plan of the church is completed, and the upper stages of the tower are also required. The works have been done by Mr. F. Caldcleugh, of Durham, under the personal supervision of the architect, Mr. Robert J. Johnson, of Newcastle.

**NEWCASTLE-UNDER-LYNE.**—The foundation stone of the new public buildings in the Ironmarket, comprising free library, a splendid assembly-room, council chamber, and municipal offices, and a school of art was laid on Friday. A competition of architects for supplying the designs of the new buildings ended in the plans of Messrs. Sugden, of Leek, and Blood, of Newcastle, being accepted conjointly with those of Messrs. Chapman and Snape, of Newcastle. The contract of Mr. J. Gallimore, of Newcastle, has been accepted for the erection of the buildings at £12,000, but the total cost, including site, will probably be nearer £14,000. The plans show an edifice of Renaissance character: the Ironmarket front, where stone dressings abound, being—with its tower—treated in sympathy with severer Classic precedent; whilst the other portions of the structure, which are entirely in brick, relax into the quainter handling seen in Flemish towns. The council chamber will be on the ground floor, 38 ft. wide, 50 ft. long, and 18 ft. high. It has three embayed recesses, each containing a wide window of three compartments with window seat, divided from each other by the pillars under the colonnade above. At each end of the room is a richly-decorated fire-place, displaying in its overmantel the arms of the borough. The free library is about 24 ft. wide, 40 ft. long, and 33 ft. high, lighted from the roof and by a three-light window in the north end. It has light iron galleries every 8 ft. or so in height, connected by spiral stairs, dispensing with long ladders. The general newsroom and the reference reading-room are each 25 ft. wide, 30 ft. long, and 16 ft. high. In the basement an area is secured for storage of newspaper files, unbound magazines, patent specifications, and blue books. The school of art rooms are obtained in the lower ground stories. The elementary and antique schools are each 25 ft. by 30 ft., and the lecture hall (with art master's stores) is 24 ft. by 44 ft. Including the stage or orchestra, the full dimensions of the assembly-room are—length, 100 ft.; width, 50 ft.; and height, 25 ft. It is lighted from the top, so securing uninterrupted wall space for picture

exhibitions, &c. The ceiling is deeply coffered in plaster work, with a deep cove bringing it down to the walls, into which are groined a number of small windows. The main entrance to this hall (which is on the first floor) is by a wide double staircase of stone, with wrought-iron lamps and palisadings. The floors throughout are fire-proof, of cement concrete, supported by British steel girders and joists, from the works of Messrs. Dorman, Long, and Co., of Middlesbrough. Most of the floors are to be laid with wood blocks on his patent system by Mr. Roger Lowe, of Farnworth. The bricks are all made by Mr. Platt, of Newcastle, those for facing the exterior being thin ones, laid in with mortar. The stone is chiefly from "Beggars Well" Quarries, near Alton, the more exposed parts from the Roches beyond Leek. The carving is being done by Mr. Millson, of Manchester, and the clerk of works is Mr. Pattison, the borough surveyor.

STOKE ST. GREGORY.—The parish church of Stoke St. Gregory, near Taunton, was reopened on the 12th inst., after undergoing restoration. The tower has been freed from plaster and pointed. The arch at the east end of the north aisle has been reopened and rebuilt, as well as the pier on the nave adjoining. A piscina has been brought to light in the south wall of the chancel, and another in the east wall of the north transept, where also two doorways have been reopened, as well as the north doorway in the north aisle. The 15th-century wagon-headed roof of the nave has had the plaster removed from it, and the timbers have been repaired. The roof of the north transept has been repaired, and oak boards substituted for plaster. The south transept has been covered with a new roof of oak, and a new floor and joists have been placed in the church. The modern reredos has been relieved by carving and columns of red sandstone. The architect was Mr. J. Houghton Spencer, of Taunton; and the builder Mr. H. J. Spiller, of the same town. The cost has been about £900.

#### CHIPS.

The summer meeting of the Westmoreland and Cumberland Archaeological and Antiquarian Society was held at Kendal on Wednesday and Thursday in last week. On the former day the party assembled in the town hall, Kendal, where they were welcomed by the Mayor (Mr. Titus Wilson), who is the secretary to the society. Several papers were read. On Thursday the members visited Shap and Penrith.

At the meeting of the Leeds School Board, Messrs. Kelly and Birchall were appointed architects for the Bramley school extension, at a remuneration at the rate of 4 per cent. on the contracts, this to include all charges for plans, quantities, and supervision.

Mr. E. H. Shorland, of Manchester and London, has recently supplied his Manchester grates and Manchester stove, amongst other places, to the following post-offices:—Buckingham post-office, Amptill post-office, St. Leonard's-on-Sea post-office, Guildford post-office, Southampton post-office, &c.

The new railway line from Sutton-on-Sea to Mablethorpe, completed a fortnight since by the contractor, Mr. James Dickson, of St. Albans, has been inspected by Major-General Hutchinson, on behalf of the Board of Trade. The opening took place on Saturday last. The line is a single one, is in length 2 miles 57 chains, and has been constructed by the Sutton and Willoughby Railway Company, the cost being about £10,000.

Additions have been made to the fittings of Berkhamstead Parish Church in the form of a rood cross for the chancel screen, the first portion or framework of the screen, and communicant's rails to the altar in St. Katherine's Chapel. The cross stands over the centre of the chancel gates. It is nearly 6ft. in height, is of English oak, and is worked on both faces, the edges being moulded with conventional leaf ornaments. Towards the nave are medallions containing the emblems of the Passion, with an "Agnus Dei" in the centre. The cross was designed by Mr. C. H. Rew, M.S.A., and the work was executed by Mr. H. Hems, of Exeter.

In the annual competition for measured drawings held in connection with the Edinburgh Architectural Association, the first prize has been awarded to Mr. R. S. Lorimer for measured drawings of Kellie Castle, Fife, including drawings of the elaborate plaster ceilings of which the castle contains many interesting examples.

#### TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

#### TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.). To India (via Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

#### ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

#### SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after.

All Situation Advertisements must be prepaid. Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

#### NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., LI., LII., and LIII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

CLERK OF WORKS AND JAMES THORNELOE. (The system of drainage illustrated is both thoroughly well ventilated and effectively disconnected. Indeed, the same system exactly has been in practical working for several years in many instances, and has answered perfectly in all of them. A more careful study of the plan will be found useful. Every branch drain is in straight lines and of immediate access throughout by means of the inspection chambers, which, be it noted, are purposely minimised in number. There is not an inaccessible bend or trap in the whole system. Not a single pipe is placed inside the house, and each closet-pan and sink-waste empties virtually into the open air before passing into the drains. A special up-cast and air inlet are provided to thoroughly ventilate the manhole chamber, and every stack-pipe is open.)

#### GLOUCESTER BATHS COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—Is this yet another to be added to the long list of unsatisfactory public competitions? It appears so, by your recent notices of proceedings with regard to it.

The committee in their Instructions asked for certain accommodation, but also stated the price they were willing to pay, irrespective of its being unobtainable for the money. This, I know, was clearly pointed out to them by at least one competitor (who has had experience in this class of work), and in his report it was distinctly mentioned as impossible to give the accommodation for less than £8,000; and the tenders obtained for carrying out the first premiated design have fully proved the correctness of his statement.

I should like to ask, in fairness to all the competitors whose designs were rejected owing to their estimate being above £6,000, what the committee intend to do to remunerate them for their loss of time and trouble? If the first premiated design, estimated to cost £5,680, is tendered for at £8,000, and which the committee

do not seem able to reduce below £7,500, by the same rule the second premiated will cost about £9,000. Have the authors of either of these designs had any practical experience in such work before?

I examined all the designs for some three hours when on exhibition, and certainly my award would not have agreed with the referee's, neither can I see on what basis the referee calculated his estimate of cost of the design he recommended for acceptance. Did he go into this question at all? If not, how could he make such recommendations with the committee's Instructions before him?—I am, &c., A COMPETITOR.

#### A CASE FOR THE S.P.A.B.

SIR,—I inclose a cutting from *Glasgow Herald* of 11th instant. This seems to be a matter in which the Society for the Protection of Ancient Buildings might well interfere.

KIRKCUDBRIGHT.—The authorities have resolved to erect a new gateway to the extended churchyard, and a suggestion has been made that the pillar stones be taken from Dundrennan Abbey. The present gateway was erected in 1644, the pillars being of stone from the Abbey ruins.

Dundrennan Abbey is one of our finest Scottish abbeys, and from a personal knowledge of it, gained on a sketching-tour last year, I am convinced that much harm and no good must result to it from such action as is contemplated by the authorities of Kirkcudbright.—I am, &c.

JAMES K. HUNTER.

46, Newmarket-street, Ayr, July 17.

## Intercommunication.

#### QUESTIONS.

[9687.]—Strains.—I can understand the formula—

$$Z \times \frac{y}{2} = W \times l$$

or—

$$Z = \frac{2Wl}{y}$$

in the first column on page 6 of current volume of the BUILDING NEWS; but I fail to comprehend that following figure 3 in second column on the same page, which reads—

$$Z \times \frac{y}{2} = W \times \frac{l}{2}$$

or—

$$2 = \frac{4Wl}{y}$$

Should it not be—

$$Z \times \frac{y}{2} = W \times \frac{l}{2}$$

or—

$$Z = \frac{2Wl}{2y}$$

—W. J. P.

[9688.]—Sewers and Sewage.—1. Is there any way to gauge the flow of a sewer when the fall is unknown than by means of an instrument? 2. What advantages and disadvantages temporary and structural has concrete in comparison with brickwork in the construction of sewers in a large town? 3. What chemicals are used in the treatment of sewage, and how are they applied?—SANITARY.

[9689.]—Shaky Floor.—The floor is of yellow battens 6in. by 2in., 13ft. bearing, and disagreeably shaky. What can I do to stiffen it with as little disturbance as possible of the floor-boards over, and the lath-and-plaster ceiling and cornice under?—W.

[9690.]—Architects' Charges.—When an architect has arranged for drawings, specifications, and superintendence at so much per cent., and for quantities at an additional percentage specially with the proprietor, is he, the employer, justified in not allowing for quantities, having employed his own men and two contractors to do the carpenters' and joiners' work, and let other trades, such as painting and gas-fitting, without the intervention of the architect, thus depriving the latter of his quantity money, as stipulated, and in the case of painting, deferring the letting apparently for the purpose of saving the architect's commission altogether?—FAIRPLAY.

An Imperial order has been issued by the German Government directing the special committee appointed by the late Emperor Frederick to study the question of erecting in Berlin a new cathedral worthy of the Prussian capital to commence its labours forthwith.

The Duke of Cambridge will, on August 10, unveil the memorial which the Corps of Royal Engineers are placing in Rochester Cathedral in memory of the late General Gordon and the officers and men who fell in the Relief Column to Khartoum.

The trustees of the Centenary Wesley Chapel, Camborne, have instructed Mr. Oliver Caldwell, M.S.A., of Penzance, to prepare drawings and specifications for the reseating, enlarging, and altering the above chapel, as well as renovation and decorating.

## LEGAL INTELLIGENCE.

**ELECTRIC LIGHTING.—IMPORTANT DECISION.—**EDISON AND SWAN UNITED ELECTRIC LIGHT COMPANY (LIMITED) V. HOLLAND AND OTHERS.—(Chancery Division).—This action was brought by the plaintiffs, the Edison and Swan Company, to restrain the infringement by the defendants of two patents—(1) the Edison No. 4576, obtained in 1879, for the incandescent lamp; (2) the Cheesbrough patent, No. 4874, 1878, amended in 1884, for a mode of making uniform the carbon thread, which forms the light-giving portions of the lamp. The defendants were Mr. William Holland, the manager of the Albert Palace; the Jablochkoff Company, and the General Electricity Company, who supplied the installations, and the Anglo-American Brush Company, who supplied the lamps. The Attorney-General (Sir R. Webster, Q.C.), Mr. Aston, Q.C., Mr. Moulton, Q.C., and Mr. Bremner appeared for the plaintiffs; Sir Horace Davey, Q.C., Mr. Finlay, Q.C., and Mr. J. C. Graham appeared for the defendants. Mr. Justice Kay said, on Monday last, that, after careful consideration of the evidence, he came to the conclusion that the Edison patent, No. 4576, taken out in 1879, was invalid, and that the Cheesbrough patent, No. 4874, taken out in 1878, and amended in 1884, was valid. He therefore, as to Edison's patent, dismissed the action with costs; and as to Cheesbrough's patent, granted an injunction, with costs, the costs to be on the higher scale, and to be set off against one another, the costs in the Cheesbrough case to be as between solicitor and client.

**BAD MORTAR.**—George Ford, a builder, was summoned at Hammersmith Police-court on Friday for using materials in the construction of two houses in Abdale-road other than mortar. Mr. Knightley, the district surveyor, produced a sample of the mortar, and said it contained earthy matter. Mortar should be composed of fresh-burnt lime and clean, sharp sand, without earthy matter, in proportion of one of lime and three of sand or grit. He had remonstrated many times, but without effect. He took the sample from the lower part of the wall, and it contained about 50 per cent. of earthy matter, probably garden mould. Mr. Curtis-Bennett made an order for all the work up to a certain day to be pulled down, and the defendant to pay three guineas costs.

**THE "PROPER REMUNERATION" OF AUCTIONEERS.—**IN RE WALFORD—WALFORD V. WALFORD.—In this case, tried in the High Court of Justice, Chancery Division, before Mr. Justice Kay, his lordship made some important observations on the right asserted by auctioneers to settle among themselves the scale of their remuneration for sales of estates, and to exact charges under that scale from the persons who employ their services. As will be seen, all they are strictly entitled to, beyond expenses for outgoings, is a "proper remuneration," according to the scale allowed by the Court in sales of property under its control. The action was for the administration of an estate of the late Mr. Cornelius Walford, who died in 1885, having by his will disposed of real and personal estate to a considerable amount. His will contained provisions (which, however, failed) for establishing an institution to be called "The Walford Chronological Institute," also for the preservation in suitable rooms of his accumulations of literary matter, and his silver testimonials presented to him by the American journalists in 1874. The testator's real estate was subject to a mortgage to certain persons for £3,000. Subsequently to the judgment in the action the mortgage was, with the consent of the Chief Clerk, transferred to certain other persons, who were to sell the property under the power of sale, it being represented to the Chief Clerk that, under the particular circumstances of the case, a sale by the transferees would be a more economical way of effecting a sale. The property was then, upon the instructions of the transferees, put up for sale by auction by Messrs. Beadel and Co., the well-known auctioneers; but owing to the reserve price, £7,000, not being reached, it was not sold. Subsequently, Messrs. Beadel sold the property by private contract for the reserve price. On the mortgages bringing their accounts of the sale before the Chief Clerk in the usual way, he allowed the auctioneers only the charges usually allowed in cases of sales in Court, and struck £62 10s. off the charge in their bill for commission. The action now came on for further consideration, together with a summons by the mortgagees, to vary the chief clerk's certificate by restoring the £62 10s. he had disallowed. Mr. Renshaw, Q.C., and Mr. B. B. Rogers, for the applicants, the mortgagees, contended that the auctioneers' charges ought to be measured by the scale prevalent among and acted upon by auctioneers in cases of sales by free owners, and not by the scale adopted in cases of Court sales. Mr. Justice Kay, after stating that he had seen the Chief Clerk upon the matter since it was last before the Court, said that the Chief Clerks, not only in his Chambers, but

also in the Chambers of the other Judges of the Chancery Division, had agreed to settle what they considered a proper remuneration to auctioneers for doing that which the auctioneers in the present case had done. There had been an attempted sale by auction, and the sale not being effected, the auctioneers afterwards sold by private contract to a purchaser. There was in his Lordship's Chambers a regular fixed scale of charges upon which auctioneers were remunerated for work of this kind. His lordship had heard with the greatest surprise that auctioneers had agreed among themselves to fix a certain scale of remuneration upon which they chose to charge the persons who employed them. They had no more right to do that than any other body of persons in the kingdom; and his lordship hoped that no judge would allow auctioneers more than their proper remuneration merely because they had agreed among themselves to charge more. For his own part, his lordship would not recognise any such arrangement. In his opinion, the Chief Clerk was perfectly right, and had allowed to the auctioneers in this case quite as much as they ought to have. Besides the amount of remuneration, the auctioneers had been allowed a sum for various outgoings, and yet they had charged about £130 for commission alone. The Chief Clerk was quite right to disallow the £62 10s., and therefore the application must be refused, with costs.

## WATER SUPPLY AND SANITARY MATTERS.

**MILTON, BURSLEM.**—Mr. S. J. Smith, C.E. one of the inspectors of the Local Government Board, held an inquiry at the Board schools, Milton, on the 12th inst., with respect to an application by the rural sanitary authority of the Wolstanton and Burslem Union for the sanction of the Local Government Board to their raising a loan of £900 for works of sewerage and sewage disposal at Milton. Mr. J. Lowndes, clerk to the rural sanitary authority, explained that he had obtained a portion of the Abbey Farm, containing nearly 8½ acres, as a site for a sewage farm. The scheme of sewerage proposed would deal with 284 houses, comprising a population of 1,420. The assessable value of the district was £7,303. Mr. G. B. Ford, surveyor to the authority, submitted plans of the proposed scheme, and the inquiry terminated. Mr. Smith subsequently inspected the proposed site of the irrigation works.

**YORK.**—At a special meeting of the York City Council held on Monday, the adoption of the joint report of the Streets and Buildings and Sanitary Committee, embodying the revised sewerage scheme for the city, drawn up by Mr. Mansergh and the city surveyor (Mr. Mawbey), was carried. Mr. Tripp considered it a matter for congratulation that the original estimate of £106,000 should have been, with the assistance of the city surveyor, reduced to £93,000. Alderman Agar moved that the salary of Mr. Mawbey, city surveyor, be increased from £350 to £500 per annum, and commented on the valuable services Mr. Mawbey had rendered in connection with the sewerage scheme. Sir J. Terry seconded the motion. Mr. Dickinson moved and Mr. Mann seconded, as an amendment, that Mr. Mawbey's salary be increased from £350 to £400 per annum, the question of salary for services rendered in connection with the new sewerage works to be referred to the joint committee for further consideration. Ultimately the amendment was lost, eight voting for it and twenty-five against.

## STATUES, MEMORIALS, &amp;c.

**WALSALL.**—During the past week another step towards the completion of the statue of Sister Dora has been taken, the three reliefs which Mr. F. J. Williamson, of Esher, was commissioned to produce having been put in position in the pedestal under Mr. Williamson's personal superintendence. They are in white marble, and in high relief. The first panel represents the tyure explosion at the Birchills Furnaces 14 years ago, with Sister Dora directing the removal of some of the injured men, and the blast furnaces forming the background. The second represents one of the hospital wards, with Sister Dora tending an injured man, the doctor being on the other side of the bed and a sister at the foot. The third represents the children's ward at the hospital, with Sister Dora seated, holding a child on her knee with one hand and with the other touching a cradle by her side, a couple of convalescent children being at play at her feet, and the late Mr. S. Cox being seated in the background.

The Dewsbury Town Council have decided that electric light shall be adopted for the lighting of all the rooms in the new town hall, and Mr. William Hartnell, of Leeds, was appointed to make a complete installation, at a cost of £2,000.

## Our Office Table.

So the reredos at St. Paul's Cathedral is to be brought into the law-courts, after all. Sir Henry James last Friday obtained from the Queen's Bench Division a rule *nisi* calling upon the Bishop of London to show cause why a mandamus should not be issued against him to compel him to hear the case against the alleged superstitious and idolatrous figures; but the Court did not seem to be of opinion that after the Bishop had been heard, it would order an ecclesiastical trial. Lord Coleridge told Sir Henry James that he might take a rule if he pleased, but that he was to hold himself responsible for the results. This is an evident indication on Lord Coleridge's part that he believes in the episcopal veto.

The employes of Messrs. Jones and Willis, church furnishers and art workers in metal, wood, and stone, to the number of 200, and representing the various sections of their works in London and Birmingham, met at Oxford on Saturday, the 7th inst., for their annual picnic. After a round of visits to numerous colleges and public buildings, the party proceeded by steamer from Folly Bridge to the Isis Hotel at Ifley, where, after dinner, a cricket match between the two branches of the firm, and a programme of sports were decided. The remainder of the day was occupied in other outdoor amusements, boating, quoits, &c., and, after a most enjoyable time, the party went back to Oxford. About one-half returned to London, and the remainder to Birmingham.

M. ANTOINE ETEX, a sculptor, who formerly enjoyed great renown, has just died. He was born in 1808. Antoine Etex was also a painter of considerable merit, and one of his pictures is hung in the Luxembourg. Art was not, however, sufficient for the feverish activity of this extraordinary man. He was the author of numerous articles in periodicals, and also occupied himself with politics. He took an active part in the events of July, 1830, and in 1848 was a candidate at the election for the Constituent Assembly.

The building and finance sub-committees of the Imperial Institute, acting under authority specially delegated to them by the organising committee, have accepted the tender of Messrs. Mowlem and Co. for the erection of the central, eastern, and western towers of the institute, at £18,797, thus making the total value of the contract for the main buildings £161,597. The works connected with the Imperial Institute-road have been commenced, and will be sufficiently advanced for a public thoroughfare to be opened in September.

ON Wednesday the Princess Louise distributed the prizes to the students of the National Art Training School. The report stated that the National Art Training School was before all the rest of the art schools in the country, sometimes to the extent of double and treble their percentage of successes, in every subject of third-grade examination except one (scio-graphy), in which alone the schools in the country were before it. The Princess of Wales's Scholarship was awarded to Miss Hilda K. A. Robinson, and three travelling scholarships of £50 each were awarded to Messrs. John Lee, with the gold medal; Alfred L. Watherstone, with the silver medal; and Fred. Stead, with the bronze medal. The Marquis of Lorne, in responding on behalf of the Princess, said as regarded London itself, its architectural aspect had greatly improved during the last few years, and there was an immense improvement in the statues which had been erected in the squares and other public places in the metropolis.

Alterations have been made at the County Lunatic Asylum, Devon, embracing the ventilation—Robert Boyle and Sons' latest improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

Crowland Abbey, situate in the Lincolnshire Fens, near Spalding, has been found to be in a dangerous condition, and steps are being taken with a view of carrying out extensive works of restoration, which will be of an expensive character. It has also been found necessary to begin the restoration of the abbey at Thorney, which will be closed for a considerable time.

## THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LV.—No. 1751.

FRIDAY, JULY 27, 1888.

## THE REMASKING OF PUBLIC BUILDINGS.

THE idea that a building may possess only one façade, and that to the street, has happily been allowed to pass into the limbo of forgotten things. Our most costly structures of the earlier part of the present century, including most of the classical churches with temple fronts in the style of St. John's, Waterloo-road, were designed with the notion that if one good façade was presented the remaining three sides could go bare, and be shorn of all decorative detail. Even the elder Smirke in his design for the British Museum did not scruple to make the return and rear sides of that edifice quite plain; the National Gallery by Wilkins is another example of a costly front with plain brick walls behind, and the reader will recall to his mind numerous other edifices in which the one care has been to present an imposing façade, quite regardless of the other sides. In towns this practice is, perhaps, somewhat defensible; only the entrance front is seen by the public, the other sides are concealed by buildings, and it would be throwing money away to make façades all round. In those days it was not imagined that any such a clearance of old houses would ever have been made as that recently effected in the rear of the National Gallery, unexpectedly opening up the back of that edifice. The lesson is one to be taken to heart by the architect. Even economy may go to the verge of parsimony in these matters, and future generations may have thrown upon their hands the duty of re-façading the sides of edifices which may be exposed to view in the course of a few years. Thus the rear walls of the National Gallery, as seen from Charing Cross-road, are too unredeeming in their hideous bareness to remain without some attempt at relief or recasing. Something must be done to bring the walls into harmony with new buildings. The architects of the school to which we have been referring were content to carry their stone entablature and parapets just round the corner, and there leave them, the most commonplace brickwork of the "hole-in-the-wall" style taking up the return sides, without internal guttering, the eaves simply finishing the walls. To carry round the façades in their integrity would in many instances be costly and undesirable; it would be better to continue the lines of cornices and horizontal members along the walls, and to depend on plain breaks or panels for relief of the wall faces. But the question of the remasking of our public edifices is a large one. In many cases the original design has not been made with any anticipation of future changes; the window openings have been allowed to come where they will regardless of any distribution or symmetry; in short, only a frontispiece of respectable architecture has been put on a building of merely engineering character. It is not easy to do anything with such a building to make it presentable except to rebuild or mask the sides. Where the plan has been arranged with regard to the spacing of the openings, or the buildings have been blocked out in an architectural manner, the case is different; it is possible with a comparatively small outlay to produce a decent ensemble. Of course the environment of the original building has not allowed the architect in every case to choose his own plan. Surrounded closely on every side he has had to form areas for light and

air, and to place windows where he could, so that when the surrounding buildings are demolished a very irregular mass of walling is revealed. There is less excuse when the site is not so hampered. Though a stone façade to each front would be extravagant, there should at least be a study of each elevation, in anticipation of any alteration in the surroundings. Mr. W. Butterfield's fine brick church of St. Alban's, Holborn, blocked in as it was for many years, is an example worthy of following. When the houses were demolished in Gray's Inn-road they did not uncover a bare, barn-like structure, but a gabled end of surpassing merit, an ornament to the widened thoroughfare. The one-front sites are too often, it must be confessed, a temptation to the designer of pretentious façades. Three sides can be built of barn-like plainness, while on the outside façade is lavished all the ornamentation. The public authorities who make street alterations ought to have a voice in the design of public buildings erected on any inclosed site. They could at least insist that the other elevations should be designed with some reference to future remodelling and demolition; but we suppose that this would be carrying the interests of art farther than necessary or consistent with the principles which appear to have actuated the conduct of the Metropolitan Board of Works. Sites have been bought and sold for buildings on terms that would not justify the expenditure of more money on elevations than was absolutely necessary. Certainly the great cost of sites and their cramped surroundings have been prejudicial to the development of more than one-façade buildings. A splendid opportunity was afforded when the Victoria Embankment site was open for building, but here, too, the same desire to rob the sides and back for the façade is evident. We are in the secret now of the readiness with which designs for large buildings have been passed, and how very much more had to be done by fees than by honest compliance with the Building Act. A future Municipal or County Council would be removing a reproach from our national architecture by making it compulsory that every site should be occupied by buildings with more than one façade. Take, for instance, our Metropolitan theatres. Hardly one of them can show two decent façades, many are mere sheds directly one turns the corner, the stage is uncouth in its hideous proportions, backed up to houses above which it peers like a mammoth factory shed. As soon as the authorities in whom are vested the powers of the Building Act require these buildings to have good elevations all round, we shall see a marked improvement in their design and structure. If it is necessary that at least two sides should be open, both those sides ought to have elevations of a suitable character.

One-façade buildings are generally shams, and their tendency is to degrade the character of architecture. The practice reduces the art to one of making elevations for one front of a building, disregarding plan, skill in grouping, and modelling. Our forefathers thought if they could give us an elevation founded upon Vitruvian or Palladian canons, and an interior in accordance therewith, the other sides of the building could be left without any decoration. With us, cost has more to do with the matter. A large amount of money is expended on one front—say, of a theatre, a town hall, or a bank—costly materials and carved ornament and sculpture in stone are employed. We turn the corner street, and behold! all the grandness has vanished; it is a bare wall, with or without openings—not even a line of string course or cornice to carry the design through; the façade, in short, is merely tacked on to a very plain building—it is merely skin deep. This sort of architecture has been preached against often

enough. Architects and the intelligent public are aware of the sham, yet it is still the rule in towns where there is little inducement to build solidly—where only one front is rendered visible. No one knows how high his neighbour will carry up his new building, so he is not desirous of erecting ornamental gable ends or chimney shafts; but the same excuse cannot hold for the back or rear side, which may command one day a view, and be seen from a new street. What applies to domestic buildings applies with greater force to public edifices, and cost does not operate so largely. There are plenty of the new sites opened out by the demolition of old houses under the Acts for Metropolitan Street Improvements. The Piccadilly improvement scheme, the Upper-street, Islington, remodelling, the Hammersmith and Walworth-road improvements, have created new sites for buildings of a popular character, and it ought to be one of the conditions of building that the exposed elevations should be approved, having reference to the widening of, or contemplation of, new streets.

## THE EMPLOYERS' LIABILITY BILL.

THE Government Bill to consolidate and amend the law relating to the liability of employers for injuries to their workmen has come out of the Standing Committee on Law a much better measure than it went in. It will be a grievous waste of good work if the Bill is not passed this Session and all this ground has to be gone over again. The Government, however, have pledged themselves to do their utmost to get this Bill through, along with that upon Railway Rates, which is now in much the same position, and has been in a similar manner thoroughly revised and worked up in the Standing Committee on Trade, even if it is necessary to hold an autumn Session for that purpose. As to our present subject, the Bill in its amended form strikes us as a fair and satisfactory compromise between the two extremes that were pressed for by the opposing advocates of masters and men. It repeals the Act of 1880 altogether, and re-enacts the best portions of that statute, with many bold and statesmanlike additions, framed, as we believe, in the true interests of both employers and employed. We do not consider that it will lead to an increase of litigation, although it must most assuredly bring about an improvement in the position of workmen and a reduction in the risks they have to run in the course of their employment. The building trades are especially concerned with some of the changes proposed by the Bill in regard to defective plant and machinery, and more particularly as to working by means of sub-contracts.

The clause as to an employer's liability for defective plant has been redrawn in wider terms, and it now makes him responsible for an accident happening "by reason of any defect in the condition or arrangement of the ways, works, machinery, plant, buildings, or premises connected with, intended for, or used in the business of the employer," where such arose from negligence. There have been many cases in which the meaning of this word "defect" had to be considered by the Courts; and, curiously enough, the Court of Appeal has just (19th July) given judgment once more upon its application. In the action of Walsh v. Whiteley and another, the plaintiff was employed by the defendants at their mill at Blackburn as a card grinder on a carding machine. It was his duty to pass a strap over a revolving wheel in which there were certain holes made for the purpose of lightening the wheel by using less metal. In one of these holes his thumb was caught and cut off. It seems there are some 11,000 machines with similar wheels used in Lancashire, so that the case was of very general importance. The

point was whether the wheel was defective within the meaning of the Act. In the County Court the plaintiff got a verdict with damages. In the Queen's Bench the judges were divided; and now in the Court of Appeal Lords Justices Lindley and Lopes held there was no such "defect" in the wheel as to make the defendant liable, while the Master of the Rolls took the opposite view. This division of opinion fairly represents the two schools of thought which have all along existed in the Courts upon the construction of this statute, and which have naturally led to conflicting decisions: one taking wide and liberal views from the side of the men, the other looking more at its technical and narrower meaning, from the side of the masters. In this case, however, seeing that the plaintiff had himself used the machine for 13 years without accident, and seeing that the wheels were generally made that way everywhere, we must agree with the majority of the Court of Appeal in thinking that there was no such "defect in the condition" of the defendants' machinery as would bring it within the Act of 1880. It would seem to us, however, that this machine would be covered by the words "defect in the arrangement," as contained in the new Bill; and that the effect of this addition may be to compel employers to use the best machinery obtainable, and to cease using that which is dangerous, even though usual or general in their business.

The whole series of clauses defining an employer's liability have been strengthened in the new Bill in favour of the employed. Thus it is proposed that the mere fact of a workman continuing to use defective plant or the like shall not cause him to be deemed to have voluntarily incurred the risk of injury, though it will still be his duty to inform his employer or foreman of any such defect or negligence. This clause is directly aimed at some judicial views as to running the risks of the service which are based upon the old common law, and have lately been propounded on the Bench. So, again, as to the word "superintendence," we have here a wider interpretation, and an employer will be liable for the negligence of any foreman or the like exercising a general superintendence over workmen, "whether he is, or is not, ordinarily engaged in manual labour," which removes yet another judicial objection, and lets in some common sense where it was greatly needed. The new clause dealing with the position of workmen who are under contractors or sub-contractors, is, of course, of much interest and importance to the building trades, to which, indeed, it is mainly applicable. The object of the proposed change in the law is to make the responsibility for injuries fall upon the real employer, and to prevent his being able to shelter himself behind a nominal contractor, where the accident arose from negligence for which he should be liable. To enable such a workman to recover damages against the actual employer or "the person for whom the work or any part thereof is done," as the Bill has it, he will have to prove three things. First, that this person "owns or supplies any ways, works, machinery, plant, buildings, or premises used for the purpose of executing the work." Second, that the injury to the workman arose from a defect in the condition or arrangement of such plant, &c. Thirdly, that this defect, or the failure to discover and remedy it, arose from the negligence of the person for whom the work is done or any part thereof, or of some person being in his service and intrusted by him with the duty of seeing that such condition or arrangement is proper. It is obvious that, when a workman who is engaged by a contractor or sub-contractor has proved these three things, he has also proved that the nominal contract is a sham, and that the employer is really con-

trolling the works, and so should be individually responsible. But if the plant or machinery is neither owned nor supplied by this employer, then he will be in no way liable. Nor will he be liable even if this is so, unless the defect causing the accident is shown in some way to have arisen from his own negligence or that of an authorised agent or foreman in his service. It follows, from this consideration, that the Bill does not in any way alter the law whenever there is a genuine contract or sub-contract, over the carrying out of which the real employer has no control; and this is as it should be, for such contractors are usually substantial men, to whom workmen can look for compensation in case of injury. The Bill, of course, saves the liability of contractors as employers, so that double compensation shall not be received for the same accident, and it also saves all rights and liabilities as between the person for whom the work is done and his contractor or sub-contractor.

The main contest over the Bill has been upon the question of contracting out of the Act. As now amended, a reasonable compromise between the extreme views of those who would avoid all such contracts and those who would allow them in the ordinary way without any restriction, has been effected. It is proposed that any contract by which a workman deprives himself of any right under the Act shall be void, unless made in pursuance of his written request, and unless made in consideration of the employer's undertaking as to insurance, and which has been fulfilled. It is declared that this undertaking shall be to make, so long as the workman continues in his employment, an adequate contribution towards an insurance fund against every accident occurring in the course of the service, and to make good all sums payable in respect of the insurance but not paid. By an adequate insurance is meant such an amount as will insure to the workman or his representatives a benefit equivalent to the compensation recoverable under the Act. The employer's contribution may be either a capital sum or an annual or other periodical payment. Evidence of similar contracts in similar trades may be given to prove the sufficiency of the contribution, and the Home Secretary or the Board of Trade are to be empowered to consider and decide the question upon application by either employer or employed. The operation of these insurance clauses cannot be judged of until it is seen how they work out in practice; but, in effect, they make general the system already adopted by the large railway companies, in many collieries, and by other employers of labour, and there seems no reason why it should not prove equally satisfactory all round.

Amongst the minor alterations there are several of much utility and importance. Thus, the time within which notice of injury must be given is extended from six weeks, as at present, to three months, while there is a general proviso that its absence or insufficiency shall not be a bar to an action if the Court is of opinion that there was reasonable excuse, and that the defendant had not been prejudiced. This clause sets at rest some judicial doubting, and will prevent actual injustice being done by technical objections. The limit of amount recoverable is here put at three years' estimated earnings, or £250, whichever is larger, which practically raises the limit to the sum stated; but from this is to be deducted any money paid to the workman or his representative by way of insurance on account of a contribution from his employer. There is also a very useful clause providing that if an employer intends to defend on the ground of want of, or insufficiency of, notice, or that he was not the employer of the workman, he must give notice of these special defences to the Court

and the plaintiff seven days before the hearing. The effect of this necessary amendment will be that unless an employer does give the notice it will be taken as admitted that proper notice of injury was served in time, and that the plaintiff was in the defendant's employment. Where compensation is awarded for the death of a workman, power is given to the judge or the jury to apportion the amount between the wife, husband, parent, or child of the deceased as they may determine. The definition of a workman is redrawn, and it now covers, besides the ordinary class, every person employed in or about a public conveyance by land, or about a vessel engaged in inland navigation. This will remedy the injustice of excluding bus and tramcar men, and those working upon steamboats and the like. But all domestic and menial servants, clerks, and agents are still left outside the statute. Existing contracts are saved, subject to the right to determine them. There are special clauses applying the Act to seamen, and dealing with its carrying out in the Scotch Courts, which we have not thought it needful to explain. Altogether, the Bill as it now stands is a sound and businesslike measure, and one which has about it every appearance of working out well in practice.

### LAND SURVEYING.—III.

#### OBSTACLES AND INACCESSIBLE DISTANCES.

HAVING given examples of chaining and the method of keeping the field-book, we may direct the reader's attention to a few of the obstacles encountered in chain surveying. Unless a base or chain-line has been examined beforehand and poled out, the surveyor or chainman may unexpectedly encounter an obstruction to his progress. The natural undulations of the ground often make it difficult to see what impediments are in the way. One of these which we met with in conducting a survey will explain to the reader the kind of obstacle which often obstructs a base-line of some length. The survey was in a hilly part of the country, the undulations of the ground frequent and sometimes abrupt, and the line chosen lay over several fields from an elevated station to a chimney on the brow of a distant hill. Midway there was a deep depression or hollow, which was obscured by a low line of trees. Nothing could be seen of any obstruction to the line, but on descending the declivity a large pond and some farm-buildings, whose roofs were not higher than the brows of the hills on either side, blocked the way. As we descended the hill, the forward object—the chimney—disappeared from view, and it was first of all necessary to sight our line through the obstruction. We fixed a pole and flag at A, at a position from which a sight of the distant chimney could be had. We walked round the farm to B, where we could get a glimpse of A, and the station from which we started in line with it. At B we put in a pole and flag ranging with A and distant station O. The distance from A to B had to be found. To do this, the surveyor should proceed to the right or left of the obstruction, and at convenient points erect perpendiculars from A and B of such a length as to clear the obstruction, and so allow the chaining to be continued. In the case referred to we found three chains sufficient, and staves were fixed at *a* and *b* (see plan) perpendicular to the stations at A and B. Then the distance *a* to *b* gave the length of the interrupted line, because it was parallel by construction to A B. The perpendiculars may be set out with the sextant, cross-staff, or by the chain in the manner we have already described.

There is another case of obstruction. Let us suppose a house or other building is on the same level as the chain-line, and that we cannot see the poles or any distant mark beyond it. In other words, no poles can be

ranged forward; but we want to continue the chain-line beyond the obstructing building. To do this, we (see Fig. 9) erect a perpendicular at  $Aa$ , say four chains from the building, and another near the building at  $Bb$ , and make them each long enough to clear it. The perpendiculars must be accurately set out, and staves put up at  $a$  and  $b$  exactly at the same distance. Then we range the staves beyond the house, fixing one at  $c$  to clear it, and another four or more chains away at  $d$ . Erect perpendiculars  $cC$  and  $dD$ , and make them exactly equal to  $Bb$  and  $Aa$ . Then it is evident that  $C$  and  $D$  are in line with  $A$  and  $B$ , and the chaining may be continued after taking the interrupted length  $bc$ , and any offsets to the building. Often the obstruction is only a few feet, and the offset staff is then sufficient to take the perpendiculars till the house is cleared.

When the sight is not obstructed by the object, a very simple geometrical construction on the ground will suffice. Suppose a pond or a lake obstructs the chain: Take the chain to the edge of pond at  $b$  (Fig. 7), at 50 links or half a chain-length put in an arrow at  $a$ , and fasten the ends of chain to these points  $a$  and  $b$ . Extend the 50th link of chain so that the sides may be stretched equally to  $c$  (which has been omitted by the engraver), then an equilateral triangle is formed. Measure in the direction of the side  $ad$  till the pond is passed, and construct a similar triangle at  $d$ , giving the side  $de$ , which must equal the side  $ad$ , forming two sides of a larger equilateral triangle. Then  $e$  will give the point in the

direction of the line  $AB$ , and the distance  $ae$  will equal the side  $ad$  or  $de$ , because the triangles  $abc$  and  $ade$  are, by construction, both equilateral. Another method is founded on the theorem that angles vertically opposite are equal (see Fig. 8). Arriving at the edge of the pond, or some distance from it,  $a$ , sight a line to the right or left hand to clear it ( $ab$ ), also another that will cross this line,  $cde$ , at, say, a right angle, and make a mark at  $d$ . Measure  $db$ , and make it equal to  $ad$ , also make  $de$  equal to  $dc$ . Then  $eb$  will equal in length the line  $ac$  to which it is parallel.

Let us suppose a river has to be crossed at right angles by a chain-line—a very common experience. The river is too wide to throw the chain over. Resort in such a case must be had to the principle of similar triangles. One easy method of proceeding is as follows:—Chain up to a convenient point on the banks of river, where a "perpendicular" can be erected, say, at  $a$  (Fig. 10). Fix a pole at that point, also at  $c$ , 4 chains back, and erect a perpendicular  $ab$ , 3 chains long; then if the hypotenuse  $bc$  measures exactly 5 chains, the right-angled triangle is correct. Set up a pole at  $b$ . Next, from  $c$  erect another perpendicular of 6 chains,  $cd$ , and fix a pole at  $d$ ; then  $db$  should measure also 5 chains exactly. If correct, send across the river a pole to fix at the intersection of the chain-lines  $AB$  and  $db$ . By construction  $AB$ , the width of river required will equal 4 chains, and the hypotenusal line  $Bb$  5 chains. Observe that the base of the first triangle  $ac$  should be made of sufficient length, or be fully equal to the width of river. If the river looks wider than 4 chains, go back from  $a$  8 or more

chains, making the other sides in the same proportion, or multiples of 3, 4, and 5. Fig. 11 gives a simpler method.  $AC$  is erected perpendicular and bisected at  $a$ ;  $CD$  is also erected perpendicular upon  $AC$ ; then poles at  $B$  and  $a$  are sighted to cut  $CD$  in  $D$ . By similar triangles,  $CD$  equals the distance  $AB$ .

An important observation ought to be made here. These interruptions frequently cause confusion in chaining by the arrows being counted wrong, unless the following rule is observed:—Enter in the field-book the distance measured to edge of pond or river, and note how many arrows the leader has in hand before any further chain-work is undertaken. After finding the width of river or obstruction, add it to the chainage previously noted, taking care to make the necessary allowance before starting again on the other side of the river. For example, if the distance across is 400 links or four chains, the leader must have four arrows less in hand than when he was on the first side of river, and the follower four more arrows. Should the whole chainage plus the river width be a broken number, say, 2,360, begin chaining at the 60th link. It is safer when the line is interrupted to make a sketch plan of the river and constructional lines, carefully noting the distances measured as a check on the field-book.

We have already noticed the rule as to the fence and ditch, but a few words more are necessary in considering the subject of obstructions. Let us suppose we are surveying a field, and have come up to a fence or hedge, the ditch being on the other side. The

general rule is that the ditch belongs to the field in which we are standing, so that the chain must be passed through or dragged through the hedge to the brow of the ditch on the other side, an allowance of five or six links being made for the width of ditch from the quick of hedge. This allowance is necessary, as it is often difficult to find out the brow of a ditch, it being usually trodden down, and is often the side of a footpath. In some parts of the country a wider ditch is allowed, varying from seven to ten links, so that it is necessary to inquire of some farmer the local custom. If we are chaining the other way, having to cross the ditch to reach

the hedge, the chain must be dragged up to the "quick" of hedge, and a deduction of six or more links made from it. Thus if the chain crossed the quick or centre of hedge at 56, we deduct six links and enter 50 in the field-book. Should there be no ditch on either side of the hedge or fence, the chainage is measured to the quick or centre, and the fence marked in the field-book thus . When growing crops only are to be measured, the boundaries are those of the crops. Sometimes the fence is not at right angles to the chain line, and in this case a greater allowance than six links is necessary. The most expeditious way of finding the boundary is to run the chain through the fence, and

see where six links of the offset-staff placed square with the fence will cut the chain. A paling has usually the nails driven from home, the fair side being inwards. With regard to walls, the ownership should be inquired into; if it is a party-wall, the centre line is the boundary.

As in chaining by obstructions a right angle or perpendicular has often to be set out from the chain or base line, it may be of service to point out an expeditious method of doing so when a cross-staff or sextant is not carried. Set off on the chain-line 40 links from any point C (Fig. 19), to another d fix one end of the chain at C. Then take 80 links and hold it at a firmly. Take the chain at 50 links from the first end and pull

PLAN N° 5

it tight both ways until the sides form two sides of a triangle, putting down an arrow at the angle b, which will be the perpendicular to the second point.

As a further example of chain surveying, we give a plan of the windings of a river through flat country, showing the best method of setting out the lines. We may assume the river forms the boundary of an estate, and that it is required to plot it with accuracy and despatch. We also assume there is no plantation to interfere with the ranging of the lines which form the main triangle. The first thing is to walk over the ground and pole out the most desirable stations for the lines which will best form the sides of triangles, and take up the offsets to the river's brink. A little care and attention to this preliminary work will be amply

repaid. The triangulation we show is self-proving and very simple. The two large intersecting triangles which take up the chief bend in the river are easily chained and well "tied." The main line 1 forms the base, and should be accurately measured, its direction being determined on the ground, and the four stations carefully noted in the field-book; the direction of the second chain line is determined by lines 1 and 3, though it might also be found by the aid of an angular instrument the use of which we shall refer to by-and-by. We indicate by the numbers in circles the order in which the lines ought to be chained. The offsets along the river may be taken every half chain or so apart, if great accuracy is required. The largest triangles should be laid down first in the plan, their accuracy being proved by the intersection. If the bends are much more than a chain in curvature, minor lines or triangles can be run to take up the detail. We have been supposing the ground on the margin of the river is open; but if the sight is obstructed by woods, the bends of the river must be determined by taking the angles with an instrument.

Our plan is accompanied by the field-book for the main lines, the others being entered in the same manner; but we prefer, in small surveys of this kind, to obtain a map or make a sketch plan of the river with the chain lines entering the distances and offsets as they occur. At any rate, it is a good plan to enter all the station distances on the plan, and take any offsets where the irregularities of the river render it necessary. One or two rules about setting out triangles for surveys of this kind may be given here.

(1) A well-conditioned triangle is that in which the three angles are more or less nearly equal; therefore, a triangle that has its angles about 60° is the most desirable to adopt in laying down a system of lines. (2) All diagonals for a like reason ought to intersect as nearly as possible in the centre of the ground if it is quadrilateral in shape. (3) Acute and obtuse angles are to be avoided, as it is difficult to obtain very exactly the intersection of such lines, and the plotting is liable to error. (4) The fewer the triangles into which the area is divided the better.

## THE METROPOLITAN BOARD OF WORKS INQUIRY.

THE Royal Commission appointed to inquire into the alleged irregularities of the Metropolitan Board of Works resumed its sittings on Tuesday.

Mr. Arthur Cates, architect to the department of Woods and Forests, said he had observed that a statement had been made to the effect that Mr. Vulliamy's opinion of the value of the Pavilion site was supported by the view of Mr. Cates. He presumed that this referred to himself, because he was aware of no other surveyor of that name. In private conversation with Mr. Vulliamy he had informed him what he had obtained for land in Piccadilly, but he was in no way consulted as to the Pavilion site. If he had seen a plan of that site he should have certainly expressed a different view.

Mr. F. H. Fowler, architect, and late a member of the Board of Works, was again called. He explained in detail the cases in which he had advised clients on questions affecting property over which the Board had jurisdiction. In the course of seventeen years the total amount of fees which he had received in such cases was £550. He wished to deny that there was any arrangement made by him with Mr. Sefton Parry under which it was suggested that he was to supplant Mr. Emden as architect of the Avenue Theatre. No communication was made to him with regard to becoming joint-architect of Terry's Theatre. He also emphatically denied that there was any truth in the statement that he requested Mr. Snelling to introduce him to the syndicate who were carrying out the improvements at Brixton. By Mr. Bosanquet: Mr. Snelling said, "I met Mr. Fowler

and he asked me to introduce him to the syndicate. I told him that it would be of no use, as I had introduced an architect of my own whom I had known many years." Do you say that nothing of that kind passed?—No, I never thought of acting as architect. Mr. Snelling goes on to say that you remarked, "Oh, it would be advisable, because I could make things go so easy for you. I could make a nice promenade in front for you." What do you say to that?—I certainly said, "Here is a public disgrace and scandal in Brixton, and if you can make an improvement, I will do all I can to assist you," but not as an architect—as a public man. What scandal?—I was referring to the forecourts not being built upon close to the railway station.

Mr. Robert Evans, surveyor, recalled, said that he had suffered considerable injury by reason of a statement that he had only just started in practice as an architect when he laid out the Albany-road Estate, at Walworth, and that in consequence Mr. Fowler was called in. The fact was that he had been in practice 28 years.

Mr. Snelling, recalled, adhered to his account of his interview with Mr. Fowler, and said that he told the members of the syndicate of it at the time.

Mr. Geo. Edwards, a member of the Board of Works since 1873, and deputy-chairman from 1886 to 1888, was the next witness. By Lord Herschell: At a recent meeting of the Board you used these words, "I hope we are not going to drift back into what used to exist here—an inner cabinet." What did you refer to?—My feeling was that there was a certain party at the Board which wished indirectly to rule it, and conferred together prior to the meetings. Whom did that inner cabinet consist of?—It was merely a surmise. I thought Colonel Munro, Mr. Runtz, Mr. Selway, and two or three others sitting round the same corner. You speak of "drifting back" into it, as if it were a thing which had existed and had ceased?—Since the Board had increased in numbers I think it would not tolerate that sort of thing as much as it did before. Your idea was that the Board was led more or less by a certain number who acted together!—Yes, certainly. Who were the two or three others?—I should say Mr. Fowler was one of them. They were the moving parties, and used to have great influence in getting members to vote on questions which they took up. Was Mr. Saunders one?—He would not be so much at the Board, but certainly he would be consulted afterwards. Did you support the letting of the Pavilion site to Mr. Villiers?—No; I was directly opposed to it. By Mr. Meadows White: Had you any suspicion of Mr. Goddard's honesty?—The first suspicion I had was when a reference was made to him as to whether Mr. Villiers would advance his offer. Putting one or two things together—first the fact that he had introduced Mr. Villiers, and then that he had committed the Board to Mr. Villiers—I began to have very grave suspicion. Lord Herschell: How did it come before the Board that Mr. Goddard had done this? I thought it was Mr. Vulliamy. Witness: We used to read between the lines. Mr. Vulliamy was a weak official, and I always looked upon Mr. Goddard and Mr. Robertson as Mr. Vulliamy. Did it not occur to you that if Mr. Vulliamy was so weak that he was merely Mr. Goddard and Mr. Robertson's voice, some steps ought to be taken with regard to it?—Well, you know what boards are. They are minorities and majorities. (Laughter.) I for years endeavoured to persuade my colleagues that we ought to insist on the resignation of Mr. Vulliamy, and was unsuccessful. When Mr. Vulliamy was pensioned and was afterwards allowed to come back, was there any opposition?—I considered it most ridiculous. By Mr. Bosanquet: Had you ever any suspicion of Mr. Robertson?—Oh yes, from his extravagant living. When did that suspicion first arise?—Five or six years ago. By Mr. Winch: I suppose you were not one of those who voted that Mr. Vulliamy in addition to his salary should have his pension running concurrently?—Certainly not.

Mr. Selway hoped the commissioners would allow him to disclaim any knowledge of an inner cabinet in the Metropolitan Board of Works. He declined to accept the honour which Mr. Edwards wished to confer on him.

Mr. Winch: I understand that this cabinet was without emolument, which is rather unusual. (Laughter.)

Mr. G. B. Richardson, who had been a member of the Board of Works since 1862, said that Mr. Vulliamy was formerly a very excellent officer, but of late years was very inefficient. He had urged the chairman not to allow the department to fall off, as it was becoming a disgrace to the Board. Had you suspicion of Mr. Robertson?—Since 1875 I never had any faith in him, and he knew that perfectly well. The evidence taken then in respect of Mr. Fuller's complaint about the book of reference was sufficient to show that he was dishonest. There were two Messrs. Fuller in London constantly seeking for compensation cases. One of them got a great many, the other very few. They were relatives. The one who was successful in getting many believed there was something wrong, and laid a trap. He wrote to Mr. Robertson, offering him a couple of guineas for a copy of the reference book which contains the addresses of all claimants against the Board and the character of the property. The bait took. Then Mr. Fuller wrote to the chairman, informing him of what had taken place. A committee of the Board instructed the then solicitor (Mr. Smith) to see Mr. Fuller. Mr. Smith was shown the book which had been received from Mr. Robertson, and the cheque drawn out in that gentleman's favour. Mr. Robertson did not wish to pass the cheque through an account of his own, and had asked that it might be cashed. He was sharp enough not to put his name on the back. There was not absolute evidence, but it was stated distinctly and clearly that Robertson went down to the office, received the two guineas, and left. In reply to Mr. Winch, the witness said that a report was made by Mr. Goddard to his chief, Mr. Vulliamy, that he had reason to believe that Mr. Robertson was living beyond his means. Mr. Robertson was keeping two carriages and a livery servant. He used to drive to the Board's offices in a carriage, with a livery servant behind him, like a gentleman in the highest degree. According to Mr. Goddard's statement, Mr. Vulliamy said that he knew that some property had been left to Mr. Robertson, and he would therefore take no notice of it.

The inquiry was adjourned to Friday (to-day).

#### THE SOCIETY OF ARCHITECTS.

BY the courtesy of Mr. J. H. Greathead, the engineer, a visit was paid on Thursday week by the members of the Society of Architects to the subway now in course of construction for the purpose of providing the inhabitants of South London with underground railway communication with the City. The members assembled upon the spot where the Kennington Station is to be built, and were conducted over the works by the resident engineer, Mr. Basil T. Mott. They descended by a cage down the shaft, 60ft. deep, which is eventually to be fitted with an hydraulic elevator to convey fifty passengers at a time between the over and underground stations. From the foot of the lift passages branch off at easy gradients to the up and down platforms, which, however, have not yet been constructed. At the present time temporary headings have been driven on either side, where the station is to be built, to meet the permanent tunnelling beyond, which is constructed of cast-iron rings, previously coated with Angus Smith's anti-rust solution, built up in segments. The up and down lines have been kept perfectly distinct, running in different tunnels, mostly side by side, but occasionally one beneath the other. To avoid the expense of settling claims for compensation, such as have proved a heavy burden to other undertakings of a similar nature, the railway is being constructed, wherever possible, beneath the public roads. The principal attraction to the visitors was the method adopted for driving the headings. This consists of a steel shield slightly larger than the rings, with knife edge around its circumference, driven forward at the rate of 13ft. a day by hydraulic rams worked by hand. The earth in front of the shield is first loosened to a small extent by manual labour, and yet more by a series of iron shod piles attached to the

press and pushed forward in front of the cutting edge. The space between the earth and the casing left upon the shield being moved forward is subsequently filled with liquid hydraulic lime injected by means of compressed air. Great care, the visitors were informed, has to be taken in setting out the directions and gradients of the tunnels, the line of route having to be first carefully surveyed above ground and the same measurements and angles having been obtained below with absolute exactitude. The cars will, it was understood, be propelled either by cables and fixed engines or by electricity to avoid vitiation of the air, and will act on the principle of piston rods in the tunnel, producing a perfect system of automatic ventilation. At the conclusion of the visit, the President of the Society of Architects, Mr. W. H. Seth-Smith, proposed a vote of thanks to Mr. Greathead for permission to go over the works.

A special general meeting of the Society was held at St. James's Hall on Tuesday, the 24th inst., under the presidency of Mr. W. H. Seth-Smith.

Messrs. Charles Edward Butcher (Colchester), Fred. Cartwright (Bromley, Kent), Harry Clayton (Barborton, S.A.R.), David Morgan Davis (Neath), Fred Harrison (Lytham, Lancs.), William Hope (North Shields), Thomas Kershaw (Huddersfield), William King (Bakewell, Derbyshire), Frank Morton Palmer (Horwich, Lancs.), Thomas William Turnbull Richardson (Stockton-on-Tees), Michael Shelborne (Grant-ham), and Frederick Chapman Tyos (Headingley, Leeds) were duly elected as members of this Society, and three other gentlemen were nominated for election at the next meeting.

After the rules passed on June 19th had been confirmed, a long discussion arose upon a proposed new rule giving the Council power to deal with the members proved guilty of unprofessional conduct, which eventually passed in a considerably amended form.

The inventor of the system of ventilation used in the meeting-room, Mr. F. H. Smith, then explained its action, the meeting concluding with a few experiments.

#### LONDON BOARD SCHOOLS AND MUD FOUNDATIONS.

A MOST discreditable state of things is being brought to light with respect to the London Board Schools. In no single instance where investigation has followed complaints, have things been found according to specifications certified.

As a test case, the condition of the school in Broad-street, Radcliffe, was brought before the Board. This building was begun in 1884 and finished in the autumn of 1886. In May last Mr. Bailey, the new architect to the School Board, reported that "the foundations, instead of resting upon hard ground, as they should do, stand immediately upon a soft bottom of foundry ashes." Mr. Murray, the measuring surveyor, made a further examination, which showed that whereas the contract depth of the foundations for the walls was 10ft., the depth paid for varied from 11ft. 9in. to 15ft. 6in., while the actual work executed was only 7ft. 3in. to 9ft. 9in., and one wall carried down to a depth of 3ft. below the ground-floor line rests upon what appears to be a thin layer of concrete 6 or 7in. thick, under which is a mass of rubbish having no binding qualities. "The concrete generally is composed of grey-stone lime, ballast, large flints, old bricks, and brick-bats. The footings seem to be built principally of old bricks."

On this the committee addressed a letter to Mr. E. R. Robson, the late architect, inclosing the reports, and stating that "they propose to recommend the Board to call upon you to make good the loss occasioned to the Board owing to their payment on your certificate for work which has not really been done. They will be glad to know, before submitting this report to the Board, whether you have any observations to make." Mr. Robson replied on the 19th June, saying, among other things:—

The committee appear to have it in their minds that it was the duty of the architect to see everything personally, and that he should be held personally liable for the mistakes or misconduct of the officials acting under him, as well as of the builder. From the nature of my appoint-

ment, and the enormous pressure devolving upon me, the first was always known to be impossible in my case; and the second is, I venture to think, an unreasonable view. In addition to the clerk of works, an inspector of works had been appointed by the Board with the distinct object of relieving me from the bulk of the inspection, and he devoted his entire time to the work. My own inspections were directed more particularly to points of light, ventilation, and other matters affecting the daily life of the school, of which the inspector could not be expected to judge. My certificate, when given, was based on the results arrived at by the surveyor. . . . I cannot for one moment believe that the Board, under the circumstances, and with a full knowledge of the facts, will call upon me to make good the loss in such cases, even if I were liable, knowing as they do that I have not been personally blameable.

In the mean time the committee had directed a further and more complete investigation by Mr. Rickman, quantity surveyor, who has been specially acting as their adviser, who, on 22nd June, sent in a report, from which the following are extracts:—

"There are a number of cracks in that part of the school which has no basement." "The concrete has unbroken brickbats and large lumps of slag. The mortar of footings is like black mud. The bottom appears good." "Concrete bad; it looks like muddy river sand and large lumps of unbroken slag. The mortar bad. The bottom seems good, and may be old concrete from pre-existing building." "Water was found in hole standing 6in. to 8in. above the bottom, the foundation bad; a bar buried easily 2ft. 6in. deep." "Bottom bad and soft." Concrete made with brickbats and large lumps of slag. The mortar better, but the joints not flushed in. Some of the footings are old red bricks." "It would appear as if the concrete were not good enough to be carried on piers (which under some circumstances might have been inserted and carried down to firm ground), but that when the building comes to be underpinned both the concrete and the footings would have to be removed; but this must depend on further investigation as the work proceeds."

On investigating the various returns it appears that the final certificate of the architect was given in December, 1886, and the account was then paid. Within less than a year cracks appeared in the main walls of the school.

The resolution fixing responsibility upon Mr. Robson, the architect, and calling upon him to make good the loss, formed the subject of an excited discussion at the last meeting but one of the Board. It was, however, ultimately carried by a large majority. What the architect's reply to this official demand will be remains to be seen.

If this case stood alone it would be sufficient to disclose a gross amount of laxity and carelessness—if nothing worse—in the department. But the committee have had to inquire into complaints respecting schools in every quarter, and similar conditions have been disclosed. Of the Queen's Head Schools, Islington, Mr. Robson himself writes that a visit he paid "reveals a case of wilful misrepresentation on the part of the clerk of works. The concrete shown on the plan (of foundations) does not exist under the building to the amount there figured. . . . It will be necessary forthwith to underpin and build two piers in cement."

Out of a total expenditure for the year ending 25th March last of £1,052,224, the net cost of educating the 328,405 children in average attendance was only about £630,000. The whole balance was devoted to enforcing compulsion, to industrial schools, to office charges, and to interest on loans expended in purchase of land and erecting these buildings.

## THE TURKISH BATH: ITS DESIGN AND CONSTRUCTION.

By R. OWEN ALLSOP, Architect.

### V.—CONCLUSION OF DETAILED CONSIDERATION OF FEATURES PECULIAR TO THE BATH.

**D**RESSING and cooling accommodation in a public bath may, I should have observed in my last article, be provided in one of the following ways: 1.—A separate frigidarium and distinct dressing-room, arranged (a) in direct communication with one another, or (b) connected by a lobby, corridor, or passage; 2.—A combination apartment arranged (a) with dressing-boxes around the walls and couches in the centre, or vice versa; (b) with Oriental divans; (c) with couches screened off in pairs by dwarf wood screens; (d) with a few private dressing-boxes, a few couches, and a few lounges, and easy, cushioned chairs; and (e) as a simple room with couches placed therein, by the side of which the bather will undress, and on which he will recline after his bath.

The first of these arrangements may be admirably adapted to unpretentious establishments, where, however, it is wished to employ separate rooms; the second (1, b) is only suitable for elaborate baths of the highest class, in which it may be adopted with excellent and with practical results. Of the combination arrangements (a) has little to recommend it, (b) is expensive and extravagant of space, though it may be made very effective in appearance, (c) is suitable for ladies' baths; (d) is very practical, and gives the apartment a pleasant, homely look; and (e) is best for cheap baths, being the simplest arrangement possible, wholly unsuited, however, to establishments of any pretension.

Of the requirements of the separate cooling and dressing-room I have already spoken. It may be as well to add, however, that in the case where the two apartments do not immediately adjoin, the means of communication be carefully studied; that it be free from cross draughts of cold air; and that it be dignified and room-like—not a mere passage. It may have the air of an ante-room, but must not be crossed by entering bathers who have not divested themselves of their boots or shoes. Slamming doors should be avoided, having regard to the exposed condition of the bathers.

Personally, I would gladly enter a protest against the employment of the combined cooling and dressing-room as a decidedly uncleanly habit. It is certainly not pleasant to know that, having obtained perfect physical cleanliness, both inwardly and outwardly, one must return to couches whereon previous bathers may, as likely as not, have, however temporarily, deposited more or less of their underclothing or superimposed raiment. Moreover, the garments of a score or more of bathers depending from the walls of a cooling room do not, theoretically, at least, tend to sweeten its atmosphere. But economy of construction is nowadays a question that must be considered at every step, and the combination apartment saves both space and materials, and is also economical as regards attendance.

In arranging the plan of a combined cooling and dressing-room it is necessary to first decide as to how the apartment will be furnished—viz., which of the plans above mentioned shall be adopted. This is much a matter of individual taste, though the demands of decency suggest the provision of screens. It is often the best course to provide a cooling-room of what may be called the "picturesque" order, or the reverse of stiff formality. By this I mean such an arrangement as 2 d. The bather can then choose between reclining in semi-privacy or in the open, or, again, resting in an easy-chair. With a handsome plunge-bath and a pretty little fountain, such rooms may be rendered very attractive.

Whatever be the plan decided upon, it must, I repeat, be carefully thought out previously, and not left as an after-thought. The size of the reclining couch will be found to be the governing feature. This should be 6ft. 6in. long by 2ft. 6in. wide, or 6ft. by 2ft., according as luxury or economy is the end aimed at. Next to this must be considered the space allowed for each bather to dress in, and also the routes for bathers and attendants. Four feet between the couches is a sufficient space where couches are screened off in pairs—a distance I have elsewhere named as proper in a separate cooling-room; but this was an oversight, as in such places less than 3ft. will suffice, as the bather never dresses or undresses therein.

Couches may be arranged in pairs or singly. Two pairs of couches screened off with only a small space between of 4ft. or so is an objectionable arrangement. It is difficult to explain why this is so; but the bather who has made one of four strangers thus closely penned up will appreciate it. An arrangement of four couches must expand into a spacious divan.

The floor of a cooling-room must be boarded. In a bath where cost is subordinate to excellence, a parquetry floor may be provided, and mats employed, as cleaner than fixed carpets. The walls and ceilings may be treated in any manner that may be chosen—plastered, papered, or decorated with colour.

Any shaped room may be adapted as a combined frigidarium and apodyterium, so long as it fulfils the essential points—i.e., that it be spacious, capable of easy and perfect ventila-

tion, and of being kept cool, light, and cheerful. In the cooling-room the bather will stay longer than in any other apartment, and no pains should be spared to render it healthy, comfortable, and attractive. The hygienic points to be attended to are that there be an abundant supply of fresh cool air and an effective withdrawal of vitiated air, just as in the hot rooms was done with the hot air; for the cold-air bath in the cooling-room is, in its way, as all-important as the bath of hot air. The freshness of the air is of equally vital importance, as much of the invigorating effect of the bath—that effect which to the minds of the unformed is *weakening*—results from submitting the heated skin to currents of cold air.\* In arranging any screens, or screen walls in the cooling-room, therefore, regard must be had to the method of ventilation, that there be no stagnant corners and recesses. The scheme of ventilation must be decided by the nature of the apartment and its position. In most cases the air is best admitted through the windows, fitted with fan-lights falling backwards from the top, and extracted by powerful self-acting exhausts at the ceiling level. In some positions extraction flues will have to be built, and, in others, flues of large area must conduct to the source from which the fresh air is drawn. Under certain circumstances a perfect supply of fresh air will not be obtainable without the aid of a powerful blowing fan-wheel driven by a motor of some sort. The means does not so much matter so long as the end be gained, and an ample supply of cool air obtained. A warm, close "cooling-room" is worse than useless. In such places the bather will break out into renewed perspiration, and lie perspiring for hours, and become greatly weakened thereby, with a good chance of taking a chill on leaving the establishment.

Cooling-rooms will always remain sufficiently warm in all weathers if they be in any ordinary relation to the heated apartments; but in the height of summer care is required to keep them sufficiently cool. Where simple, everyday precautions will not suffice, the air itself must be cooled either by passing it through a cold-chamber or over ice-boxes in inlet tubes, or through a waterspray. Only in exceptional cases, however, is it necessary to resort to such measures, as, contrary to the teachings of theorists, it has been found in practice that the proper temperature for the cooling-room of a hot-air bath varies in different states of the weather, and should not remain constant all the year round.

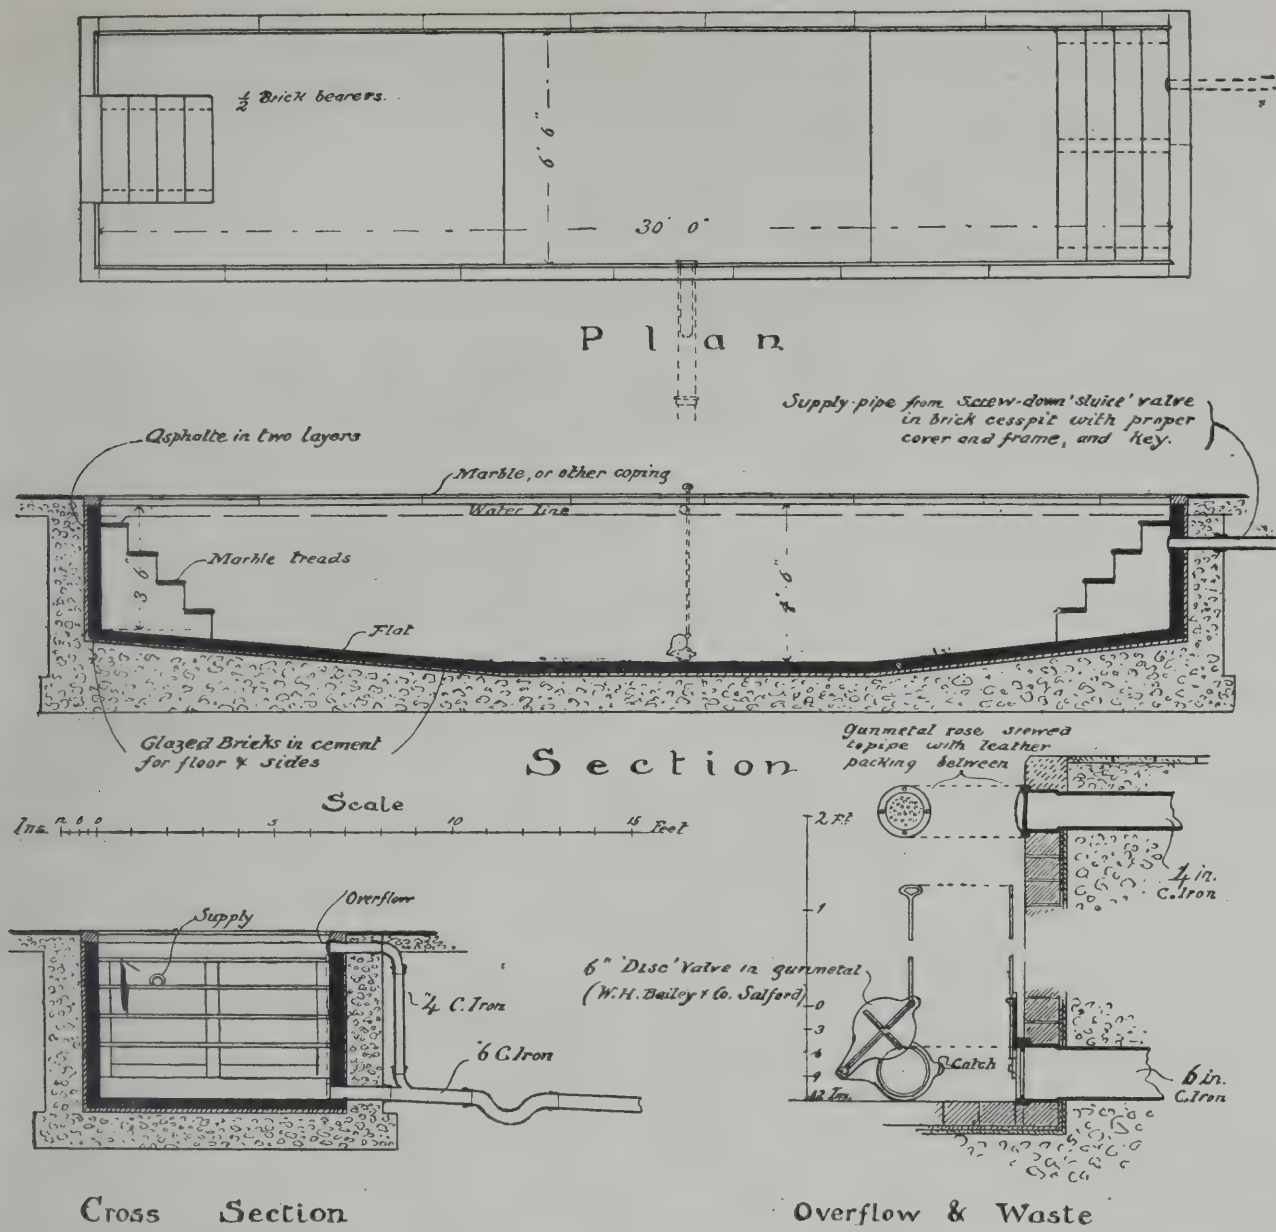

### CONSTRUCTIONAL DIFFICULTIES.

A few possible sources of difficulty may arise during the construction of a bath. At the outset, dampness may be feared in the basement. In such cases vertical layers of damp-proof material must be employed on the outside of the walls, or the latter may be constructed wholly of concrete, except for a facing of glazed brick. In the hottest of the hot rooms, dampness is impossible, as the heat will permeate the surrounding earth.

The construction of cavities and flues for the extraction of the vitiated air from the sudatory chambers does not ordinarily present any difficulties. If a bath be constructed in the lower floors at one and the same time as the rest of the building, the provision is easily made. So, also, in cases where the sudorific chambers are constructed at the back of the main building. But where the bath is adapted to an existing building, some scheming is requisite. Advantage must be taken of any suitable existing flues. It will, however, generally be necessary to construct a large shaft against one of the exterior walls of the old building, and into this to collect the vitiated air. In the case of a sudatory at the back of an existing building, the flues may run to the coping and be finished with ventilators or windguards, or they may be collected and run into a flue of large section bonded to the old back wall. Where, in cases as above, the walls are hollow the vitiated air may be turned into the space between the curtain light and the skylight—between the ceiling and roof. From hence it may be drawn by a patent extraction ventilator.

\* Not draughts. The ancient Romans, it is curious to note, would walk in the open air after the bath; and both the *Frigidarium* of the Romans and the *Mistabiy* of the Turks were, and are, open to the heavens.—R. O. A.

The flues might be turned into the same space, and the air similarly treated.\*

Fireproof floors over hot rooms may be of any design that is also heat-proof. The main point is to have a sufficient thickness of concrete, and that the iron joists and cross girders are well buried therein. Ordinary floors may be rendered heat-proof by partially filling the space between ceiling and floorboards with sawdust laid on boarding nailed to fillets on joists. The sawdust should be filled up to level of top of joists; over this a layer of thick felt, and the boarding above. This, however, is only a makeshift when compared with a solid floor of concrete.

Heat permeating other apartments and neighbouring premises is a frequent source of trouble to the builder of a Turkish bath, but is always the result of want of study of the subject on the part of the designer. The evil may be successfully combated if it be resolved that no hot room, shampooing-room, or lavatorium shall be constructed without a thick concrete floor above, and that the furnace chamber be constructed below the laconicum. Should the walls of the hot rooms adjoin in any part apartments where it is urgently necessary that the heat should be prevented from being transmitted to—they may be rendered heat-proof by building them hollow and filling the cavity with soot.

Double doors and lobbies must be employed to prevent the transmission of the heated air to rooms where its presence would be injurious. To keep the hot air of the bath-rooms from the cooling-rooms, &c., should be the great aim of the architect. Many baths are rendered quite

repulsive by what I may perhaps term the "sudorific smell" which assails the nostrils of the visitor entering the vestibule.

As regards thickness of walls, in constructing a bath in an old building, all that will be often necessary in some parts is to line the existing walls with a half-brick wall with glazed face, a cavity being left for the vitiated air. The walls of the hot rooms of a small bath, where in the basement away from main building, may be 14in., built with 2in. cavity, or, if preferred, 9in. with flues.

A hollow 18in. wall will suffice in a bath of ordinary dimensions, where the hot-rooms are built above ground and isolated.

Specifications, when alluding to cavity walls and air-flues in Turkish baths, must provide for their being neatly finished and truly and carefully constructed, and not left with lumps of mortar choking them up, as so frequently done in the case of the cavity walls in ordinary building.

Floors of ordinary-sized baths, where the soil is reliable, may be of 6in. of concrete, with mosaics or tiles laid in cement. The benches for reclining and shampooing must be built up from this with half-brick risers, with glazed fronts, with weathered marble slabs with rounded nosings, as illustrated in my last article.

The plunge-bath is at times a source of two difficulties—it may leak, and it may be below the level of drain. The first evil is the result of an error in design, or of bad workmanship; the latter is unavoidable. The following method of constructing a plunge-bath has been adopted with perfect success:—On the bed of concrete prepared for its floor, erect side walls of concrete, and on the floors and walls thus formed

spread two distinct layers of asphalt, covering all and running up to the underside of coping. Against the sides build half-brick walls in cement, with glazed face, and lay the floor with glazed bricks flat. The general principles of this construction I show in the accompanying illustration.

Where the bath is lower than the drain, all that can be done is to drain out as much as possible and pump the remaining water from a "sump" provided in the bath.

Glazing in the hot rooms requires care. The glass will expand considerably with the heat, and, what is more, if the furnace fire die out rapidly at any time, will contract and fracture. This difficulty, however, is the result of bad management, and not to do with the architect, unless, indeed, it be the result of improper fixing. Even moderate-sized sheets of glass should be carefully fixed in chamois leather with screwed beading, putty being wholly inadmissible. The sheets of glass should not be of too large dimensions. Rolled glass will be found the cheapest in the end, as inferior qualities, where homogeneity of texture is wanting, will crack and split in all directions. Lead glazing in small panes may be adopted for partitions.

Horizontal and inclined flues for conducting hot or cold air may be carried from point to point on rolled iron joints having tooled York slabs set thereon, the flues being constructed of 4½in. brickwork with glazed face internally, built in cement, and covered with tooled York slabs. Provision must be made, in such flues, for effective cleansing by means of iron, air-tight doors.

(To be continued.)

\* In my next article—on "Heating and Ventilation"—I shall explain by diagrams the methods of arranging extraction flues, &c.—R. O. A.

## ILLUSTRATIONS

"JUSTICE" AND "PLENTY."—OAKDENE, FINCHLEY,—DEWSBURY TECHNICAL SCHOOL AND SCHOOL OF SCIENCE AND ART.—NEW CHURCH AT KILTIMAGH.—ASYLUM FOR DEAF AND DUMB CHILDREN, OLD KENT-ROAD.—SCULPTURED PANEL FROM TRAJAN'S FORUM, ROME.—A CORNER HOUSE AT HAMFSTEAD.

## OUR LITHOGRAPHIC ILLUSTRATIONS.

## "JUSTICE" AND "PLENTY."

These statues are by Mr. C. B. Birch, A.R.A., sculptor, and are for the Australian Joint Stock Bank, Sydney, New South Wales.

## OAKDENE, FINCHLEY.

THIS house has just been completed for Mr. J. Westwood Thompson. It is situated on about 4 acres of ground running down to the Dollis brook, and has extensive views all round. The materials used are Heather red-pressed bricks and Corsehill stone dressings, the upper stories and roof being covered with Broseley tiles. The staircase and hall are in wainscot oak, and the sitting-rooms are panelled with pine, painted. The builder is Mr. S. J. Scott, of Blomfield-street, E.C.—PERCY STONE.

## DEWSBURY TECHNICAL SCHOOL.

THE building, which is the outcome of the Queen Victoria Jubilee celebration in Dewsbury, is now in course of erection upon a commanding site in Halifax-road. The site is very convenient to the populous parts of the town, and is central to the out districts that are expected to make use of the institution. Besides the accommodation shown upon the small plans, provision is made for chemical laboratory and dyehouse. The materials used are Delph wall-stones from the Brighouse quarries for all external walls. The woodwork of committee-room, library, and secretary's office is to be executed in the best Baltic wainscot oak. All remaining work to be selected yellow pine, stained and varnished. The slates to be used are the best green slates from the Buttermere quarries. The works are being carried out by local contractors, under the supervision of the architect, Mr. J. Lane Fox, whose design, submitted in a competition of local architects, was unanimously adopted by the committee.

## KILTIMAGH CHURCH, IRELAND.

THIS church is about to be erected, with a new presbytery adjoining it, for the Very Rev. Denis O'Hara, the parish priest, on a county side site at Kiltimagh, to replace the older building which is possessed of no architectural interest. The ground-plan with the view will explain the arrangements of the church, which will be carried out in local-quarried stone, with dressed quoins and copings. Mr. William H. Byrne, of Suffolk-street, Dublin, is the architect.

## ASYLUM FOR DEAF AND DUMB CHILDREN, OLD KENT-ROAD, S.E.

THE old asylum premises in the Old Kent-road (so familiar to many from the fine trees in the forecourt), which were erected at the close of the last century, having been found to be in want of considerable repair, and being un-

adapted to the requirements of the modern system of teaching now pursued with the deaf and dumb, the committee of management decided to pull down and rebuild, rather than alter and amend, and accordingly the present building now occupies a portion of the site of the old. The new building—which is designed to accommodate 80 children on their election to the benefits of the charity, and is a sort of nursery for their early training before being drafted to the large establishment at Margate—is a plain and substantial structure of brick, with facings of red-pressed bricks and Bath stone dressings. The floors and staircases are of fireproof construction, by Messrs. W. B. Wilkinson. The corridor, class-rooms, and dining-rooms and dormitories are heated with hot water. The ventilation was carried out by Robert Boyle and Son. The contract for the whole of the works was in the hands of Messrs. J. and J. Greenwood; Mr. A. R. Mullins is the architect.

## SCULPTURED PANEL FROM TRAJAN'S FORUM, ROME.

AMONG the many specimens of the Roman antique which enrich the grand collections of the Lateran Palace Museum none exemplify the special characteristics of Roman ornamentation more fully than this unrestored panel of a frieze, which we illustrate to-day in photographic detail, from the Forum of Trajan at Rome. It is singled out in the "Grammar of Ornament" by Owen Jones as worthy of special attention, together with another corresponding example of the same period, exhibited also in the second gallery on entering the Lateran. Its design is thus alluded to particularly because the sculpture illustrates the Romans' favourite method of introducing the human form in conjunction with foliations and scrolls, terminating the body in foliage, which in turn branches off into conventional ornament. This style of composition, too, really formed the basis of the then universal method among Roman artists for their painted decorations. One scroll is made to grow out of another scroll, which generally encircles a flower or group of leaves, very cleverly exhibiting a power of drawing and skill in carving, though seldom adapted really to the ornamental accessories of strictly designed architectural forms. The acanthus is rendered with more naturalesque precision than in Greek work, and the leaves become more flattened out, laying, as it were, one over the other in close confusion. Instances can be quoted where this objection is not so evident as in others. Thus the fragments of sculpture from the Museo Bresciano are more elegant and refined than those from the Villa Medici. The Trajan panel here represented has another common feature to be noted as a favourite with the Romans—viz., the introduction of the cinerary urn, which forms the centre of the composition. So typical a specimen of work from so grand a period of historic art cannot fail to be of value to all students.

## COMPETITIONS.

TAMWORTH.—An adjourned meeting of the Town Council was held on the 19th inst., the Mayor presiding. The principal object of the meeting was to examine the various plans for the proposed new municipal buildings. Eventually, Alderman Shaw proposed that the plan of Mr. Joyce, of Stafford, be accepted, subject to any alteration the council might decide upon. This was seconded by the Mayor, and carried.

The work in connection with the restoration of Moberley parish church is being pushed forward with great vigour. Already the greater portion of the chancel and vestry has been taken down, and it is expected that building operations will be commenced shortly. The decayed beams and rafters which have been discovered show how greatly the restoration was needed. Mr. Crowther, of Alderley Edge, is the architect, and the builder is Mr. Brown, of Chester.

The foundation stone of a new church, to be erected at the village of Scotton, near Knaresborough, was laid on Thursday week. The church is to be erected from the designs prepared by Mr. Fowler, of Durham, architect. He estimates the cost at £1,000.

## SOCIETY OF ENGINEERS.

ON Tuesday the Society of Engineers visited the new precipitation works at Barking sewage outfall. They were received by Mr. Geo. Marshall, on behalf of Sir J. W. Bazalge, C.B., engineer to the Metropolitan Board of Works, and luncheon was provided by the contractors, Messrs. John Mowlem and Co.

At the present time the whole of the sewage of the metropolis north of the Thames is conveyed to Barking Creek by three culverts, each 9ft. high by 9ft. wide, and is, in the first instance, delivered into a covered reservoir divided into four apartments, and altogether extending over an area of nine acres. The sewage is stored in this reservoir during eight hours of each tide, and discharged into the river at high water at the top of the ebb. This reservoir is situated on the east side of the sewer, and immediately adjacent to the river bank.

The new works consist of covered precipitation tanks adjacent to this reservoir on the north side, and occupying the ground between the outfall sewer and Barking Creek, an area between ten and eleven acres.

There will be thirteen of such tanks, each 31ft. 6in. wide, and averaging about 1,000 long. Communications will be made between the outfall sewer and each of these tanks, each fitted with two penstocks, so that communication may be opened or shut off at pleasure.

The sewage will be admitted into each of the tanks in succession, and after being allowed to remain quiescent for a sufficient time to admit of the deposit of the solids in the sewage, the precipitation of which will be expedited by the admixture of 3·7 grains of lime and 1 grain of proto-sulphate of iron per gallon, the effluent will be run off over a weir which will fall the water in the tank lowers, so that the film of the effluent only will be taken off, and the tank emptied gradually so as to prevent any disturbance of the solids by the operation.

The effluent after flowing over the weirs (of which there will be ten in each tank) will pass into culverts carried transversely under the tanks and extended—some into the compartments of the existing reservoir—and some into a chamber under the outfall sewer through which, at present, the sewage is discharged into the river from the existing reservoir. When the level of the tide will admit, the effluent will be discharged through the chamber direct into the river, but when the water in the river is too high to admit of this the effluent will be conveyed by the other culverts into the several compartments of the present reservoir, and stored there until the level of the water in the river will admit of discharge.

When each compartment is emptied of the effluent, the sludge, which will be in a semi-liquid state, will be discharged through culverts passing under the outfall sewers into a collecting culvert, from which it will be conveyed by pipes into a receiving well or sump and pumped into a series of 12 tanks placed side by side and situate between the outfall sewer and the river. These tanks will each be 20ft. wide and 140ft. long, will cover an area of over an acre and a half, and, like the precipitation-tanks, will be covered so as to prevent nuisance.

The sludge will be allowed to remain quiescent in them so as to allow of a further precipitation, and the effluent water will be discharged over weirs into a culvert which will convey it into a store under the tanks, from whence it will be lifted and discharged through pipes to the liming station, there to be mixed with lime, which is used for precipitation.

The settled sludge remaining after the further precipitation will be discharged through culverts into a sludge store situated under the tanks, and will be lifted thence and conveyed by pipes along a jetty, and to a laning stage to be erected in the river, and the discharged into ships which will convey the sludge to sea. In the event of the ships being detained by stress of weather, there is a further store for sludge at a lower level, extending under the whole of the area occupied by the upper stores.

On the north side of these sludge settling tanks will be erected engine and boiler houses and workshops in connection, to contain engine and machinery for lifting the sludge into the

settling tanks, and the settled sludge into the ships, as well as for pumping the sludge effluent to the liming station.

The lime for assisting the precipitation of the solids of the sewage is introduced into the outfall sewers at a point about 700 yards and the proto-sulphate of iron about 530 yards above the precipitation channels.

The liming station will comprise a lime store, floors for slaking the lime, and six tanks for mixing the slaked lime with the effluent water from the sludge settling tanks or with sewage taken direct from the outfall sewers; an elevated lime-water tank or reservoir built above the lime store, and into which the lime-water will be lifted by pumps, for which machinery and the requisite engine and boiler-houses will be erected adjacent to the lime stores. From this elevated tank the lime-water will be conveyed to and injected into the sewage passing along the outfall sewers, through cast-iron injectors placed in the sewers.

There will be means of turning the lime-water into any one of the three lines of sewers and of regulating the supply by means of sluice-valves fitted to the pipes leading to the injectors. The injectors consist of cast-iron chambers 4ft. 6in. in length, 6in. wide, and 6ft. in height, fitted with a number of nozzles, through which the lime-water will be injected and mixed with the volume of the sewage as it flows past.

The iron-water station comprises timber sheds for storing the proto-sulphate of iron, a mixing shed in which the iron will be crushed and mixed with water, an engine-shed to contain engines and machinery for crushing the iron and mixing it with water, as well as for raising water for boilers and into mixing tanks. The iron-water will be conveyed by stoneware pipes, carried underground and along the top of the outfall sewer into a service tank, from which it will be carried by pipes into each of the three outfall sewers, and injected into the sewage through perforations in a pipe fixed vertically in each of the sewers. As with the lime-water, there will be appliances for regulating the supply of iron-water to each of the sewers, to meet the varying requirements of the discharge.

There will be a large settling-pond, covering an area of  $1\frac{1}{2}$  acres, situate near the river, divided into six compartments, each 60ft. by 60ft., and about 7ft. deep, into which water will be received from the river and allowed to settle; the clear water being afterwards filtered and used for the supply of the several boilers, for slaking the lime, and for mixing with the proto-sulphate of iron.

The works extend over an area of about 50 acres, the quantity of sewage to be dealt with will amount to about 90,000,000 gallons per day, and the quantity of lime to be used in precipitation to 23 tons per day.

Two contracts have been entered into for the execution of the works, one with Messrs. Mowlem and Co. for the general work, for £406,000, and the other with the Glenfield Company, of Kilmarnock, for engines and machinery, for £42,567.

#### CHIPS.

It has been finally decided, after many years' consideration, to construct a marine drive to connect the two cliffs at Ramsgate, at a cost of £50,000. A deputation waited upon the mayor of the town on Monday night, and urged upon him the desirability of the authorities proceeding with the work at once. It was stated, in reply, that favourable terms had been offered by the Board of Trade for the property required. A large model of the road was on view, showing the entire transformation of the sea front, including the removal of the harbour offices, the construction of a new quay for yachts, &c., and a new and improved approach to the sands and the London, Chatham, and Dover Railway.

Mr. E. H. Shorland, of Manchester and London, has recently supplied his inlet and outlet ventilators, amongst other places, to the following:—Fire brigade station, Oldham; new Wesleyan chapel and schools, Watersheddings, Oldham; and the Methodist Free Church Schools, Oldham; Messrs. Potts, Picup, and Dixon being the architects for the whole of same.

Under the direction of Mr. Blomfield, A.R.A., Mr. Harry Hems has just placed twelve more statues *in situ* at St. Alban's Abbey. There are now 58 of the 70 there.

#### WAYSIDE NOTES.

MY note of alarm at the possible action to be taken by the Corporation of the Church House in respect to the design of their proposed building appears to have been unwarranted. Although the corporation intend at first only to alter the buildings existing on the site in Dean's-yard, they have every intention of ultimately erecting a new "house" worthy of its objects. The hints thrown out by speakers at the recent conference in a marquee in Dean's-yard seem to point to a fine building in the near future. Lord Justice Cotton said that the site was not what the corporation hoped to show the world, but that for the present the existing buildings would serve as the Church House until they could erect one worthy of the corporation and of the purposes in view. For this it was stated large funds would be required. We may, therefore, look hopefully forward to the day when we shall take up our "B.N.," and find an announcement requesting us to compete for the new building—unless, indeed, the work be given to any architect in the meantime.

*Punch's* design for the Church House will have been noticed with amusement by many. In the main it consisted of a tower, in which different parties were to be arranged in varying altitudes, according as they were "high" or "low" Churchmen. The Evangelical section in the lower portion of the tower, had very narrow windows, as, it was explained, very little light is admitted at this elevation. The Broad Churchman's apartments above were fitted with spacious windows, having a liberal outlook, whilst the High Churchman was to be located in the roof with comparatively narrow windows. I can only suggest, by way of an improvement, that gentlemen of the Church Association stamp should be accommodated in the cellars, where the light of day would be excluded altogether.

"The Church Association's last move" formed the title of an article in the *Spectator* of last week. Said the writer: "The attack upon the reredos of St. Paul's is the expiring effort of the party, well-meaning and sincere, however short-sighted and narrow-minded, which, in its day of power, placed Shakespeare under ban, and forbade tailors to sit cross-legged, for fear of superstition, and sent mothers to prison for kissing their children on Sunday. The spirit of the age and the common sense of the public are against the Church Association in this matter. Those who have made war on the St. Paul's reredos because it contains the figure of the Saviour on the Cross do not propose to destroy all the painted windows on which the Crucifixion is depicted. How do they justify this inconsistency? Their spiritual progenitors were more logical. They saw no difference between painted windows and sculptured marble, and they destroyed both with indiscriminate ruthlessness. The mind which is stupid enough to pay Divine worship to an image in sculpture is not likely to recoil from worshipping the same image in painted glass or on canvas." We do not want a modern Puritanical attack on new churches. The bigoted old Puritans have done quite enough in old buildings. Further argument on this subject, however, is superfluous, since, as you observe, the Church Association have no chance of winning the day. The legality of the Exeter and Denbigh cases—very similar to the present one—having been established, there seems little reason why the reredos of St. Paul's should be mutilated at the hands of the modern descendants of those persons who, in days gone by, destroyed a few acres or so of beautiful stained glass, and chopped off the heads of some thousands of statues, the gems of workmanship and sculpture of those ages, which, as the Dean of Gloucester says, we are pleased to call Dark.

"Practical Architecture" should be well read. The series you are giving is just what is wanted by students—and by a good many more than students; and the excellent illustrations will render them of the greatest service to such. I really think these articles should supply a long-felt want. Whilst on the subject of illustrations, I should like to express my indebtedness for the photo-tints of Ely and Lichfield. One feels infinitely thankful for anything that will take one's thoughts off the

professional side of architecture for a moment, now that the air is thick with scandals and the name of "architect" appears to be synonymous with business ways which, to say the least, are peculiar, like those of Ah Sin. Thanks to the guilty ones and the M. B. W. inquiry, architects are now on the stock list of the comic papers. "There being always some difficulty in drawing the line," said one of these journals last week, "the architects at the Metropolitan Board of Works draw three, so as to make sure of one being correct." This is certainly not a very brilliant joke, but may be taken as a type of the class.

Having been staying for two or three days in the Isle of Thanet, I have taken the opportunity of refreshing my memories of Canterbury Cathedral, and visiting other "lions" of the interesting old city. I was somewhat curious to find out what had been done with the bones of St. Thomas-a-Becket, as the remains recently discovered were alleged to have been. With this end in view, I submitted to the usual ordeal of following a verger through the choir, chapels, cloisters, and crypt, and listening to his old, old story. I find that the bones have been placed in a rough sarcophagus in the crypt of Becket's "crown." The theory that they are in truth the remains of the saint does not seem to find very great favour with the worthy vergers. The old gentleman who showed us round seemed very little inclined to give ear to the assertion, from whatever quarter it comes. Neither, I can only conclude, does anyone else, or the bones would not have been shovelled into a clumsy coffin, cemented up, and left to the darkness and dankness of their present position.

St. Martin's Church, at Canterbury, generally supposed to be the first Christian temple in England, I had hitherto left unvisited; but on Monday last I critically inspected the exterior and interior. There seems little reason for doubting that the priest's door at this church is the oldest of its kind extant. So far as I could judge, the jambs are of Roman workmanship, while the arch above has been turned by Saxon hands, as it is not constructed of shaped voussoirs, but long, parallel-sided stones kept in their place by the cementing material. At any rate, I fondly hope that I have seen the oldest priest's door, as I am particularly interested in such features. They are often of such delicate proportions—veritable architectural tit-bits. The other interesting object at St. Martin's is a font of reputed Saxon design, whose mass and outline resembles nothing so much as a homely water-butt. Its appearance certainly excuses one's assigning it to so remote a date.

St. Augustine's College I also visited for the first time. One cannot but think that the late Mr. Beresford-Hope secured this site not a moment too late. It is sad to remember what a grand old building was destroyed when, early in the present century, the church of St. Augustine's monastery was pulled down. Old prints in the college library show that a comparatively small portion of the church remained then; but the towers of fine Norman work existed. All that now remains indicates that the architecture of this building must have been of a singularly massive type. The ruined base of the north tower still remains, as also does a portion of the north aisle. In some places fragments of tile pavement have been unearthed, and other curious things might be found if some of the more architecturally-inclined students would excavate a little in their spare hours. A small hole or two they have scraped in places; but want of perseverance is only too plainly evidenced. This is not to the credit of those who have attempted to discover fresh remains. The obstacle to further progress appears to be a layer of stones from the old building—the result of falling arches and piers. If I were one of those who have thus easily been disheartened I would quickly fill up the insignificant holes that have been scratched in the soft earth, and not leave them to be unintentionally pointed out to the visitor as monuments of apathy. GOTH.

The Plumbers' Company have made a grant of five guineas, to be awarded as prizes to the students attending the plumbing classes at the Polytechnic Y.M.C.I., London, for the session 1888-9.

# PRACTICAL ARCHITECTURE WITH DETAILED ESTIMATES.—III. By HENRY LOVEGROVE, F.S.I., Surveyor.

## NOTES ON BRICKLAYER.

BRICKWORK is measured superficially, and the thickness of wall is written against the dimension, thus :

20.0	15.0	2½ B. foot
9		
20.0	180.0	1½ B. wall
9.0		
3.0		
3.6		Brickwork
10.0		

The latter item is taken cube because it is the rule to do so for thick or irregular walls, angle chimney breasts, and the like. The whole is reduced, as the abstract shows, to the superficial rod of 272ft., 1½ brick thick.

Measure the walls, first dividing the various thicknesses, and afterwards take all projections, such as chimney breasts. Any portions in cement are taken as "brickwork extra only in cement," unless the quantity is very large.

The publication of the dimensions for this trade *in extenso* would tend to confuse rather than to instruct the student; but in some simpler building following, I shall be able to illustrate the whole process, and enter more fully into the details of labour on brickwork. The form of abstract is complete, but in some cases the first figures only are given to avoid repetition.

## BRICKLAYER.

Carried to summary.....

## WATER ENGINEERING.\*

THE storage and conveyance of water for the supply of towns and other purposes call for a large and varied knowledge on the part of the engineer. Not many in the profession have had the opportunity of acquiring a practical knowledge of hydraulic engineering in its various branches, and few books have been published on the subject. Mr. Charles Slagg, water and drainage engineer, Associate Member of the Inst. of Civil Engineers, has written a useful little book on the subject, which has appeared in a series of articles on the water question in the BUILDING NEWS. At the request of several readers, the articles have been reprinted, with much additional matter. The preliminary sections are devoted to storage reservoirs, embankments, and kindred details of a practical nature. The failure of reservoir embankments—notably, the Bradfield and Holmfirth—is noticed, and the causes of the slips. The quantity of water to be stored is considered at some length.

Mr. Slagg enters into the various conditions, such as rainfall, absorption in ground, evaporation, &c., that have to be considered, and gives a practical example of the mode of dealing with the subject. The experience gained by observation has been that in order to equalise the flow of water during three or four years of least rainfall, the capacity of a reservoir ought to yield about 120 days' supply where the rainfall is frequent, as in the western side of the country, and 240 days' where it is less frequent, as in the eastern side. The details of reservoirs are discussed; the reader will find references to the opinions of eminent engineers. Some practical remarks are given as to the length of waste-weir per 1,000 acres, and the drainage area; also as to the cost of reservoirs, the concrete for embankments and dams, and other details. Stream gauges, rainfall, conduits, head of water, pressure, strength of cast-iron pipes, the rules for calculating the water flowing down a river channel, are valuable sections of the book. Water power, and the various forms of water wheels, are discussed. In the concluding section the author deals with the important question of county boards and watershed areas, and the maintenance and repair of the banks of a river. The necessity of forming district watershed areas is evident for rating. Where the boundaries of the counties follow the watershed lines there is no difficulty, but where these run through parts of counties only there would be. In this case Mr. Slagg says the principle of the majority might be acted on—"either a majority of votes or the greater part of the rateable value of property within these outlying parts. The inhabitants, if any, of

such parts might have the choice, to which county they will contribute, for the amount would be comparatively small." A still more difficult question is to determine the liability where the river forms the boundary or the centre of its course in this case. The author makes some sensible remarks on this subject. He says, "Where the boundary is, and must remain, in the centre of the river, it may probably be found advisable to give control of both banks to one authority, or half the whole length to each adjoining one. A post on each bank directly opposite each other, distinctly marks the division of jurisdiction, while the centre of the river is but a vague and uncertain division, and even if the two adjoining authorities could always agree to carry on the work of protection or repair of the banks, so that no injury should be done by one to the other side, there are other though less important difficulties which would arise out of such a boundary, irrespective of any question concerning the banks." As Mr. Slagg says, many advantages would result if the county boundaries were made coincident with the watershed lines, which can be accurately determined. The book will be found a thoroughly practical one, the work done by water-wheels, and the modes of calculation, service reservoirs and tanks, floods, and the means of relieving lands from them, are considered.

## Building Intelligence.

**BOOTLE.**—A vacant space abutting on to the Liverpool and Southport line and having a frontage in Oriol-road, has been secured by Messrs. F. W. Soames and Co., brewers, of Wrexham, as a site on which they purport constructing a large general depot. The façade will be of a substantial character, the Liverpool and district agent's offices occupying the ground floor, whilst the rear of the building will be so constructed that the greater portion of the loading and unloading will be done on the railway platform. The new building will be ready at the beginning of the new year, and will, when completed and in working order, cost about £15,000. The architect is Mr. Doyle, and the greater portion of the work will be carried out by Messrs. Dransfield and Smith.

**BRAUNTON.**—The grand old oak roof of the church of St. Brannock, at Braunton, near Barnstaple, has just been restored under the direction of Mr. William White, F.S.A. The length of the nave is nearly 80ft., and, being a span of 34ft. without a tie beam, the roof had spread as much as 24in., partly slipping upon the walls, and partly carrying the walls with it on each side, to the extent of from 8in. to 10in. The rafter couples have been drawn together one by one, and repaired with new English oak piece by piece, and secured with iron ties. The plaster ceiling put up some years ago has been removed, and the roof boarded beneath the new slating. The old carved bosses have been replaced with the moulded ribs, some of which have been renewed. One large boss in the centre of the roof represents the ancient legend of St. Brannock, having for its subject a sow with a litter of pigs. The Saint was told that he would meet with these, and that he should erect his church on the spot where they should rest at night. The roof is of the 15th century. The bells also have been rehung.

**CATERHAM.**—The Duchess of Albany distributed the prizes to the children of the Warehousemen's, Clerks', and Drapers' Schools at Russell Hill, Caterham, on Saturday, July 7. This institution has been honoured by royal visits—the foundation-stone was laid by the Prince of Wales, the patron of the schools; the addition which is known as the Leaf Memorial wing being inaugurated by the Princess Louise and the Marquis of Lorne in 1878. At present certain works and decoration are being performed at the institution by Messrs. Wall Bros., of Kentish Town, and the fine dining-hall has been renovated, and two 48in. exhaust ventilators have been placed in the roof. The works are being done under the superintendence of Mr. J. Kingwell Cole, M.S.A., architect, of 28, Mount-street, Grosvenor-square, W.

**DARTMOUTH.**—The famous old church of St. Saviour's at Dartmouth is now being restored from the designs of Messrs. Ashworth and Sedding, joint architects. The work at present is confined to the chancel. The vestries are being enlarged and the chancel galleries taken down. The chancel windows are mostly new. There will be new stalls in carved oak, and the organ will be placed in the north chancel transept. All the old latten memorials in the chancel are being carefully preserved. There is a new oak roof. The carving of the roof is entrusted to Mr. Harry Hems, of Exeter. The exterior masonry is, in the main, of Dartmoor granite and Wadstray stone. The general contractor is Mr. Rundle, of Kingsbridge.

**HALIFAX.**—The new buildings which have just been completed in Waterhouse-street, Halifax, for the Yorkshire Penny Bank were opened on Monday afternoon. The new premises have been built from the plans of Messrs. Perkin and Bulmer, architects, of Leeds, and the general design is Early Gothic. There is a frontage of 55ft., with basement, ground floor, and three upper stories. The ground floor and basement will be used for the purposes of the bank, while the upper floors will be let as offices, there being several suites. The bank itself is appointed with walnut fittings.

**HARROGATE.**—The memorial stone of the New Town Mission Hall, Harrogate, was laid on Thursday, July 19th. The buildings consist of a hall 48ft. by 32ft., and 45ft. across transepts, having porch and vestibule, with octagonal tower rising 40ft., in which is placed stairs to gallery; on ground floor of tower are two vestries. The walls are of yellow sandstone to the plinth level, and blue wall stones and white dressings above, with red Broseley tiles on roof, which is over 25ft. to collar beam, having Boyle's concealed roof ventilators. Accommodation is provided for 350 persons, at a cost, with missioner's residence, of £1,450. Mr. J. Dickinson is the contractor, and Mr. T. Butler Wilson, of Leeds and Harrogate, the architect.

**WOLVERHAMPTON.**—On Thursday week a private inspection of the new Dunstall Park racecourse, Wolverhampton, was made. The area is about 130 acres. The new buildings, which are elaborate in design, are situated on the south-east side. There are three stands, with their appurtenant buildings. There are, first, the saddling and weighing rooms, and next to these are situated the jockey and press stand. This building is furnished with lavatories, refreshment, and writing rooms, and on the balcony at the top are arranged two divisions for the jockeys and the representatives of the press. There will also be a railed enclosure in front. Next to this is situated a post and telegraph office, and a few yards further is the grand-stand, fitted up with every necessary requirement. The next structure is the ordinary stand, capable of accommodating 1,500 persons. From the winning post there will be a run in of a quarter of a mile to the railway arches and back along the brook which runs in the rear of the buildings. The erection of the buildings is being executed by Mr. H. Willcock, builder, Wolverhampton, whose contract is nearly £5,000; and the making of the new six-furlong course and other earthworks has been carried out by Mr. A. Turner, of Coseley.

On Sunday, July 22nd, a very large chiming clock was started in St. Peter's Church, Hindley, near Wigan. The clock has four dials, each six feet across, of very chaste but simple design; the quarters are chimed upon four bells, and the hours struck upon the largest bell in the tower. The movement is constructed with every modern improvement, so to maintain perfect accuracy, and chiefly to the designs of Lord Grimthorpe. It has a gravity escapement with a compensated pendulum. The work has been carried out by John Smith and Sons, Midland Clock Works, Derby, who have also in hand a similar but somewhat larger clock for Rawtenstall Church, Lancashire.

The shareholders of the Airedale Co-operative Building and Manufacturing Company, Limited, have held their fifty-fourth half-yearly meeting. The secretary read the report and balance-sheet, which showed the society to be in a sound position. The net disburseable profit was £222, which will pay a dividend of 2s. 6d. per share.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (via Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

## NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX, XL, XLI, XLIV, XLV, XLVII, XLVIII, XLIX, L, LI, LII, and LIII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—J. F. and Co.—B. S. and Co.—B. L. Co.—B. of L.—T. G.—T. C. H.—S. P.—C. H.—L. W. and V. Co. J. C. and Son.—H. S. Co.—D. S. Son and Co.

A. F. SOMERVILLE. (We have asked the makers of Field's flushing tanks to send you particulars.)—X. AND F. G. E. (Mr. Middleton defends his statement, which he maintains, although contrary to generally-received opinion, is correct. He will reply to you both in a footnote to his next article.)

## Correspondence.

### RESTORED FONT AT ST. MARY CHURCH, NEAR TORQUAY.

To the Editor of the BUILDING NEWS.

SIR,—A few days ago, whilst staying in Devonshire, I made a long journey especially to see the old Norman font at St. Mary Church, near Torquay, with the existence of which I had long been familiar from description. Imagine, then, my disgust, on finding that it had been restored in the worst possible taste.

The old font is cylindrical in shape, and decorated with a series of sculptured medallions representing a hunting scene, together with other subjects of the greatest interest to the antiquary. Of course the rational treatment for such a font, if it required meddling with at all, would have been to place it on a simple base corresponding in style with the rest, and not to have interfered in any way with the old work. Instead of this, however, the original font has been surmounted by a hideous new top, and the old bowl surmounted by arading of feeble design. The pillars of the arading come so close to the bowl within, that the sculpture is almost entirely hidden, so that it is quite impossible to take a satisfactory photograph, drawing, or rubbing. The recessed portions of the carving have been filled in with a brown substance resembling Roman cement, with what object it is difficult to imagine, as the disfigurement produced thereby is very great.

Vulgar so-called restorations of the kind just described are calculated to bring the utmost discredit on the architectural profession generally, and some attempt should certainly be made to put a stop to them by those who have its welfare at heart. I would suggest that the ecclesiastical authorities should step in and prevent incompetent architects from making havoc of our ancient buildings, and insist that with regard to purely archaeological matters a committee of experts should be consulted.

It is not now too late to strip the fine old Norman font at St. Mary Church of its absurd modern additions, and I hope that public opinion may be brought to bear upon the persons who are responsible for having committed this act of desecration, so as to compel them to have it brought back again to its original state. The font is now all that remains of the old church, which was entirely pulled down, although it had a good tower and other features of interest.

According to Murray's "Handbook of Devon" (p. 158), the architect of the new building was Mr. S. W. Hugall.—I am, &c.,

J. ROMILLY ALLEN, F.S.A. (Scot.)  
20, Bloomsbury-square, London, W.C.

#### ARCHITECTURAL ANTIQUITIES OF THE ISLE OF WIGHT.

SIR,—May I address myself to the readers of your paper? I am getting together the architectural antiquities of the Isle of Wight, and should be glad of any assistance in the way of drawings or notes, which would be *duly acknowledged* and carefully returned. It so often happens that notes, &c., arrive after publication, and, though of value, cannot be inserted without great extra cost. All I desire is to make the work as complete as possible, as no book exists on this special subject.

Trusting your readers will understand the spirit of my letter—I am, &c.,

PERCY G. STONE.  
16, Great Marlborough-street, W.

#### WATER SUPPLY AND SANITARY MATTERS.

**HOLMFIRTH.**—Last week Mr. Arnold Taylor held an inquiry at Hinchcliffe Mill, regarding the application of the Austonley local board to borrow the sum of £4,000 for the purposes of supplying their district with water. Mr. Joshua Barraclough, engineer, gave evidence to the effect that £4,000 would be sufficient to pay for the proposed undertaking. He also thought that there would be an ample supply of water at the proposed site, and was of the opinion that part of Holmfirth district could be supplied with the surplus water. Mr. Henry Roberts (chairman of the Austonley local board) opposed the application of the board, and advocated a joint scheme and amalgamation of the board's district with the district of Holmfirth as far more beneficial to the ratepayers. Mr. Henry Butterworth, chairman of the Holmfirth local board and a ratepayer in the Austonley district, also opposed the scheme. After hearing the evidence, the inspector visited the site of the proposed waterworks.

**SWINTON.**—Mr. Arnold Taylor, an inspector from the Local Government Board, opened an inquiry last week at the offices of the Swinton and Pendlebury local board into that board's application for sanction to borrow £8,129 for works of sewage and sewage disposal. The clerk (Mr. Hewitson) explained that the Swinton and Pendlebury local board, being threatened with litigation in respect of the pollution of Slack Brook and the river Irwell, had, with the advice and assistance of Mr. Vawser, C.E., adopted a scheme for the treatment of sewage, which the board proposed to carry out on land at the Carrs, Pendlebury, now belonging to Messrs. A. Knowles and Sons. Mr. Mountain and Mr. Vawser explained the nature of the proposed works, and the inspector, having heard further evidence for and against the scheme, afterwards visited the site in question.

The Wesleyans are erecting new Sunday-schools at Levenshulme. On Saturday afternoon nine foundation-stones were laid. The building will cost about £1,850. Mr. J. H. Maybury, of Booth-street, Manchester, is the architect; and Mr. Jonathan Swallow, of Levenshulme, the builder.

The Bradford Brick and Tile Company's report for the last half-year shows a profit on trade of £1,012 3s. 6d. The adverse balance of £388 18s. 9d. is extinguished, and £623 4s. 9d. remains as a credit balance. A division is announced of 2s. per share.

## Intercommunication.

### QUESTIONS.

[9691].—**Statue to Giordano Bruno.**—I think I observed it stated some two years or so ago that a statue was erecting, or to be erected, in Rome to Giordano Bruno. I shall feel obliged for information if it has been erected, and for a description of it if so.—W. P. BUCHAN.

[9692].—**Californian Red Wood.**—In the Irish Exhibition is a piece of this wood, with other specimens, illustrating a case of wood specimens for school use. It is quite distinct from pitch-pine or Oregon pine, and looks like a piece of American pine (of the kind known in America as "white" but which we call "yellow" pine), stained with lake colour. It is marked "For internal use." Is this regularly in the London market, and in what forms and sizes, and at what prices? I remember reading of an American red wood (pine or fir) many years since, then said to be good for all purposes, timbering, joinery, external or internal, and even for piles for water work. Is this the same timber?—W. R.

[9693].—**Window and Door Heads.**—Would someone kindly explain by a sketch the right way to carry out the following instructions—"All door and window heads to be protected by 3lb. lead, extending from the outside of the wall to the inside of the cavity and there turned up."—PARSONAGE.

[9694].—**Load for Roof Principals.**—I wish to know the safe load of the roof principal and the method of calculating same, as I can come across no like example in any book on strains, &c. Principals, 9ft. apart;

roof, 45.0; bearing, 21ft.; timber, spruce. Ridge, 7 x 2; rafters, 4 x 2; purlins, 8 x 4; P. rafter, 7 x 4; tie beam, 11 x 4; K. post, 4 x 3; struts, 3 x 2; braces out of 14 x 3.—ENQUIRER.

### REPLIES.

[9685].—**Quality of Doors Fixed.**—Proprietor can require the joiner to hang doors of the size intended for the frames. The joiner has, I take it, agreed to carry out the work to the satisfaction of the employer. If the latter allows the doors to remain, he can certainly ask that an allowance be made.—A.

[9687].—**Strains.**—"W. J. P." is right. I am obliged for his correction, and ought to have noticed the error myself when looking over the proofs. If similar slips occur again, I trust they will also be pointed out.—G. A. T. MIDDLETON.

[9689].—**Shaky Floor.**—Take up two rows of floor boards, at equal distances apart, and stiffen the joists by herring-bone bracing. Another way would be to bolt on to two or more joists wrought-iron plates 1/2 in. thick. I should prefer the former method.—G. H. G.

[9690].—**Architects' Charges.**—If quantities were prepared with the knowledge of the employer, he is certainly liable for the surveyors' commission. "Fairation" can also charge his commission on the work executed and 2 1/2 per cent. on the painting and other work deferred.—G. H. G.

### PARLIAMENTARY NOTES.

**ASSISTANT CLERKSHIPS OF WORKS.**—Mr. Lawson on Monday asked the President of the Board of Trade whether it was possible so to modify the regulations of the Civil Service Commission as to examining for appointment to assistant clerkships of works as to admit skilled artisans to the competition who might show adequate knowledge of the practical requirements of the post, and why such conditions were enforced as specially to exclude them on account of their status. Mr. Plunket, who replied, said—Appointments to clerkships of the works (there are no assistant clerkships under my office) are open to all skilled artisans as well as to others who may succeed in the open competitive examinations held by the Civil Service Commissioners. But skill as an artisan in any one branch of labour would not be a sufficient qualification, and we require, as a condition from all candidates, that they should have had five years' practical experience in the general superintendence of building work.

Yet another Jubilee statue was unveiled at Bristol on Wednesday. It is the work of Mr. J. E. Boehm, R.A., and carved from one block of Carrara marble. The pedestal is Portland, and the curb and granite from the Penryn quarries.

### LEGAL INTELLIGENCE.

**CARPENTER — BUILDER — CONTRACTOR — ARCHITECT AT WESTON-SUPER-MARE.**—At Weston-super-Mare last week F. S. Durston, carpenter, of Clevedon-road, Weston-super-Mare, sought to recover £7 5s. 6d. for work done for William Lever, stationer, High-street, who had paid £2 and costs into court. Plaintiff said in the month of June, 1887, defendant informed him that he intended to make some alterations to his premises, and asked him to prepare plans and specifications. He told defendant that he would submit the work to public competition, and that his charge for plan and specifications would be £5 5s. Some time after this defendant informed him that he did not think that he would submit the work for public competition, and asked him to give a price for doing a certain amount of work, and also superintending certain other work in the course of construction. Defendant also asked him to help him to select the necessary timber, and to accompany him to Highbridge for the purpose. The day was named; but defendant informed him that he could not see his way clear to begin the job that year. In the month of February of this year defendant again sent for him and asked him whether he would do the work at the same price as arranged in the previous June. He said he could not, but that he would do the work for £30, exclusive of the different items mentioned last year. Plaintiff went to Highbridge in company with the defendant and made a selection of the timber, and he also superintended the work and used materials according to his specifications. Matters went on pleasantly until the 7th of June, when he asked for the payment of 50s. As defendant was paying him the money he said he wanted the front bay window finished. Plaintiff said that part of the work was not in his contract. Defendant then ordered him out of the shop, and requested him not to put his foot inside his premises any more. In about a month's time he presented defendant with his bill, when defendant again ordered him off his premises, and said he would put the bill in the fire. His Honour: How much money have you received on account? Plaintiff: £26 10s. I have not completed the sashes and frames. Cross-examined: In addition to being a carpenter, builder, and contractor, he was also an architect. He had prepared a plan and specifications, and also drawn up an agreement. He was sometimes paid 6d., 10d., and 1s. per hour for carpentry work. He agreed to work for Mr. Lever for 7d. per hour. He was also to receive one per cent. on the total cost of the outlay. He charged 15s. for his journey to Highbridge and 10s. for preparing quantities. He never told Mr. Stradling not to sign the agreement. The plaintiff then called his brother and a lad to prove that they had always been referred by defendant to the plaintiff as to the work they had to do. In defence Mr. Reed pointed out that plaintiff had appeared in court that day in the character of a carpenter, builder, contractor, and architect, and he should not be surprised to hear plaintiff say that he was a lawyer. In dealing seriously with the charges made by the plaintiff, Mr. Reed pointed out that plaintiff had admitted in his evidence that he had charged 10s. for preparing quantities, and 15s. for his journey to Highbridge as an architect, although his train expenses were paid by defendant. Plaintiff was simply employed by defendant to give orders as contractor. His Honour: It means that he superintended his own work. I consider the £2 paid into court ample, and I give judgment for defendant.

**AN IRISH JUDGE'S OPINION ABOUT ARCHITECTS.**—FLYNN V. DOLLARD.—The Irish Master of the Rolls gave judgment last week in this case for the defendant. We do not propose to recapitulate the evidence in the action, which was a light and air case, but note the fact that the Master obligingly stated that "A number of architects had made affidavits on behalf of the defendant. He (Master of the Rolls) did not consider an architect's evidence on a question of air more important than that of any ordinary intelligent person using his powers of observation."

**A CARPENTER'S CONTRACT.**—The plaintiff, Alfred James Pollard, carpenter and joiner, of Weston-super-Mare, sued the defendant, Richard Fear, a builder, of the same place, for £67 17s. 9d., for balance of contract, work, and extras carried out in completing three newly-erected houses in the Walliscote-road, Weston-super-Mare. Plaintiff's case was that he had entered into a contract to do the carpenter's and joiner's work of the buildings for £265, as per plans and specifications prepared by Messrs. Lingen-Barker and Cross, architects, Weston-super-Mare, and that by reason of certain deviations from the plans and specifications the contract had ceased to operate, and he therefore applied that the matter might be referred to arbitration. For the defence Mr. Masters referred to the clause contained in the contract that "all matters and things in dispute between the said parties relative to the above building shall

settled by the said architects, whose decision in such cases shall be binding upon and final to the said parties," and urged that unless it was intended to establish fraud on the part of the architects, the certificate given by them was final, and could not be reopened, and in support quoted the case of "Saphorne and another v. St. Aubyn." In Honour, in summing up, occurred in the new adopted for the defence, and a counterclaim which had been put in having been withdrawn, judgment was given for the defendant, with costs.

**SANITARY AUTHORITIES AND DRAINS.**—A case which affects the powers of sanitary authorities, and therefore the interests of the general body of ratepayers, was decided on Monday by the stipendiary magistrate sitting at West Bromwich. Section 23 of the Public Health Act, 1875, provides that where a house is without sufficient drainage the local authority may call upon the owner or occupier to make a covered drain or drains emptying into a public sewer where there is such a sewer within 100ft. from the house. Failing compliance with this notice, the authority may do the work itself, and charge the cost to the owner. Under this section the Corporation of West Bromwich sued Edward Phipps for the sum of £8 7s. 4d., the cost of making a drain from a house belonging to him in Fisher-street. Under the old commissioners, whose right and duties are now inherited by the corporation, the drainage from the property had been approved. The sewage ran in an open drain from the house into an open channel in the street, and from thence into a covered drain or sewer which emptied itself into the river Tame. In 1882, in consequence of complaints made by the Corporation of Birmingham that the sewage of West Bromwich polluted the river, a new system of sewerage was commenced. In pursuance of this scheme a new sewer was constructed within a reasonable distance from the house in question, the owner of which was served with a notice to lay drains to connect his property with it. The notices were not complied with, the corporation did the work, and proceeded against the defendant for the recovery of the cost. The stipendiary decided against the corporation on grounds which raise very important questions. There was a preliminary objection raised as to the form of the notice, on which the complainants were technically thrown; but although this might have closed the case the magistrate proceeded to give his judgment on the main issue which had been raised. He held that the open drains, which had once been approved by the commissioners, were sufficient for the effectual drainage of the premises, and that therefore the owner could not be called upon to alter them. Now, this decision opens two questions—one as to jurisdiction, and one as to the merits of the decision. As to the first point, it is to be noted that the clause itself does not define who is to be the judge of the efficiency of existing drains. It has been generally held that the sanitary authority is invested with this power, and this view is supported by Mr. Vesey Fitzgerald, whose annotated edition of the Local Government Act is regarded as of great value. That writer, speaking of this clause, says "the local authority are the sole judges of what constitutes a sufficient drain, including therein what materials are to be used in its construction." The opinion thus given is the one usually received, and it is scarcely possible that it can be allowed to be finally refuted by the decision of a stipendiary sitting in petty sessions. Apart from the legal point, the view taken by the magistrate is, of course, open to objection.

**COMPENSATION FOR CHEAPSIDE PROPERTY.**—**GUILDHALL, JULY 21.**—This was a case where the Commissioners of Sewers acquired a corner of Nos. 115 and 116, Cheapside, for the widening of Flook-street, the premises being occupied by Mr. Aggott, trading as "My Tailor," &c., and others, whose claims have been settled by the Commissioners. The claim of the freeholders, who are the trustees of the late Mr. Joseph Hadland, came before a special jury for assessment. For the claimant Mr. G. P. Bidder, Q.C., and Mr. H. A. D. Glyn, instructed by Mr. C. G. Woodroffe. For the Commissioners, Sir Edward Clark, Q.C., M.P., and Mr. Rose-Innes, instructed by Mr. A. E. Hayes. The surveyors retained on behalf of the claimants were Mr. E. Farmer, Mr. S. Walker, and Mr. Lang, and Mr. W. H. Woodroffe, A.R.I.B.A., who sent in the claim and negotiated the case for the claimants. For the Commissioners the witnesses retained were Mr. Robert Vigers, Mr. W. J. Adell, M.P., and Mr. Legge. After some discussion between the counsel on both sides, it was agreed that the sum of £22,500 and taxed costs should be awarded to the claimants. The area of the site is 1,300ft. The premises are subject to a lease at £800 per annum for an unexpired term of 14 years. The claim was based on an estimated ground rental value of 20s. per foot super, deferred 16½ years, on which basis the verdict was judicially given.

**THE WILL OF THE LATE MR. NESFIELD.**—**NESFIELD V. NESFIELD.**—(Probate, Divorce, and Admiralty Division.)—Before the Right Hon. the

President.)—Mary Annetta Nesfield, as executrix and widow of the late William Eden Nesfield, of 45, Buckingham-road, Brighton, propounded and sought probate of a will executed by him on August 3, 1887. Henry William Nesfield, brother of the deceased gentleman, opposed probate of the will set up by Mrs. Nesfield, and pleaded that at the date of the execution of this paper Mr. William Eden Nesfield was not of sound mind, and that consequently it was not a duly executed will. The defendant also, in turn, propounded a will which bore date August 18, 1886, and the plaintiff in reply pleaded that this will was revoked by the later testamentary paper of August 3, 1887. The late Mr. William Eden Nesfield was an architect of great ability, but of irregular habits. He died at Brighton on the 26th of March in the present year, leaving property to the amount of about £25,000. Under the will of August, 1886, the defendant was made his residuary legatee; but the will of the 3rd of August, 1887, made the plaintiff universal legatee and devisee and sole executrix. It had been expected that the hearing of the suit would occupy some considerable time, but when the case was called on on Monday last Sir Henry James stated that he was happy to inform his lordship that the only evidence which it would be necessary to adduce was that by which the plaintiff would formally prove due execution of the will propounded by her, in order that it might be pronounced for. Within the last few days the defendant had had an opportunity of looking through the documents in the case, and he had come to the conclusion that he ought to offer no further opposition to proof of the will of August 3, 1887. His lordship would have observed that in his plea the defendant made no charge of undue influence, but as matters about undue influence might have been rumoured in consequence of the will being opposed at all, he wished to say that there would be no foundation for an allegation that Mrs. Nesfield had exercised any such influence. Formal proof of due execution having been given, his lordship pronounced for the will of August 3, 1887, but made no order as to costs, it having been agreed upon that each side should pay its own costs.

**IS A "DUMB WELL" A DRAIN?**—**CROFT V. RICKMANSWORTH HIGHWAY BOARD.**—(Before Lords Justices Cotton, Fry, and Lopes.)—In this case, which came before the Court on Monday on appeal by the plaintiff in person from the decision of Mr. Justice Kekewich in February last, the question was whether a "dumb well" or shaft sunk into a porous stratum of chalk or gravel, into which surface-water from the highway was conducted by pipes, and from which it percolated away through the subsoil, was included in the term "drain," used in section 67 of the Highway Act, 1835 (5 and 6 Will. IV., c. 50), so as to authorise the Highway Board for the district to construct in the plaintiff's chalk-pit near to the highway a dumb well as part of their drainage system. The plaintiff was the owner of a house and grounds near Rickmansworth, at the foot of Scott's-hill, and above his house there was a chalk dell or pit, the property of the plaintiff, into which, at some period not clearly ascertained, the surface-water from the upper part of the hill had been conveyed by pipes which were laid into a brick receptacle called a dumb well, over which a wooden cover had been placed. In 1882 the Watford Board caused this dumb well to be cleaned out, and substituted new 9in. pipes for the old 6in. pipes. The plaintiff complained to the Board, and an arrangement was proposed by which the water and sewage which found a way into the pipes were to have been carried down to the river Chess, and the dumb well abandoned. This arrangement, however, from the provisions of the Rivers Pollution Act, 1876, could not be carried out. In January, 1884, the Watford District Highway Board was dissolved, and after some months' delay the Rickmansworth Highway Board was formed as its successor. The plaintiff had in the meantime stopped up the dumb well, and in this condition it remained until July, 1885, when the matter was taken up by the Rickmansworth Board, who had relaid the pipes and reopened the dumb well. In restraint of such proceedings the present litigation was instituted, and after a somewhat checkered career it had resulted in a decision by Mr. Justice Kekewich in February last adverse to the plaintiff's contention, which was, in effect, that the defendants, the Highway Board, were not entitled to interfere with the dumb well in his property under the statutory authority given to them by 5 and 6 Will. IV., c. 50, to make and keep open "all ditches, gutters, drains, or watercourses." From this decision the plaintiff had appealed in person. In the result their lordships, being of opinion that the "dumb well" on the side of Scott's-hill, into which water-pipes had been laid, was not "a drain" within the meaning of the Highway Act, 1835 (5 and 6 Will. IV., cap 50), section 67, so as to give defendants, the Rickmansworth Highway Board, the right to use it as part of their drainage system, reversed the decision of Mr. Justice Kekewich and allowed the appeal, giving the plaintiff

all the costs of the action and of the appeal in which he had succeeded, except the costs of an application to admit fresh evidence, which the plaintiff was directed to pay.

**ENGINEERS SHARING COMMISSIONS.**—**BURSTAL V. HAWKSLEY.**—(Queen's Bench Division. Before Lord Coleridge and a Special Jury.)—This was an action tried on Monday and Tuesday by a local engineer, who had been resident engineer for Oxford when the new filter waterworks were constructed, against Mr. Hawksley, engineer, who had been specially employed by the corporation as consulting engineer, to recover a share of the commission he had received on the work under an alleged agreement between him and the local engineer to share it in certain proportion. It appeared that in 1880 Mr. Hawksley, who had been consulting engineer to the city of Oxford for over 30 years, recommended Mr. Burstal as local or resident engineer, and he was employed as such at a salary. In 1880 the corporation resolved to establish filter waterworks for the city, and Mr. Burstal, who had been employed with Mr. Hawksley at Rochdale and two or three other places, drew some plans for the purpose (without, however, making any borings to ascertain the nature and capacity of the soil), and the corporation then consulted Mr. Hawksley, and in October, 1882, came to a resolution that the works should be carried out by him as the consulting engineer and by Mr. Burstal as the resident engineer. In consequence, it was said, of some mistake the word "jointly" was introduced into the minute of the resolution; but Mr. Hawksley pointed out that it conveyed a wrong idea, and the resolution really agreed to was that he should be employed as engineer-in-chief and Mr. Burstal as resident engineer. Mr. Hawksley, finding that Mr. Burstal had drawn some plans, desired to see them, but said that he must be solely responsible for the plans, and that they must be drawn in his office, and he made borings for the purpose of ascertaining the nature of the soil, and his plans were drawn with an important difference. The works were commenced and occupied some years, and were not completed until 1886. In 1887, Mr. Hawksley received his commission—about £700—and Mr. Burstal claimed two-fifths of that sum under an alleged agreement between him and Mr. Hawksley to share the commission in the proportion of two-fifths to three-fifths, which Mr. Hawksley entirely denied, and hence the present action to recover £284. After a long hearing, the jury at once found a verdict for the plaintiff for £284, the sum claimed, and judgment was given accordingly.

**THE BUILDING ACT: A SINGULAR QUESTION.**—At the Hammersmith Police-court on Monday, James Baker, a builder, was summoned by Mr. Ellis Marsland, M.S.A., district surveyor, in respect of a lift constructed in a block of buildings at Park-place, Knightsbridge. The question in dispute was whether a lift is legal in buildings which were let out in flats. The complainant contended that the Act prohibited any opening in a party arch, and that each flat should be separate, as the case with houses. He said in case of fire the flames would travel up the lift. Mr. Curtis Bennett referred to the large hotels in which there were lifts, and inquired whether they were according to the provisions of the Act. Mr. Marsland said those hotels did not come within the section. The majority of surveyors were in favour of his contention. On behalf of the defendant, it was stated that it was the universal practice to have lifts of that kind in mansions let out in flats. Mr. Marsland said the lift in the defendant's buildings went up through the centre of them. There was no objection to a lift in connection with the staircase. Mr. Curtis Bennett said he was against the complainant, and dismissed the summons.

**INCOME-TAX ON GAS PROFITS: CURIOUS POINT.**—There has just been decided by a judge in the Queen's Bench Division, in chambers, a case of considerable interest to the ratepayers of Newcastle-under-Lyme. Up to the present the Gas Management Committee of the Town Council have successfully maintained that the sum of £500 annually placed to the credit of the depreciation fund should be exempt from the payment of Income-tax. Mr. Clayton, of Stoke, surveyor of taxes, has disputed this, the sum sought to be recovered being only £15. The committee were supported in their contention by some dozen large Corporations, two of which cases have been fought out with success upon the precise point. In the case before the Court the Newcastle Corporation were not represented, it being considered, from statements made, that counsel would not be needed. In the Court the Attorney-General appeared on the one side, and judgment with costs went against the Newcastle Committee by default. The effect simply is that the committee will have to pay Income-tax on the £500, although no decision is given on the merits, which cannot again be raised, as the five years during which the depreciation fund was allowed to accumulate has elapsed.

## Our Office Table.

"BACK-TO-BACK" houses still exist in most large towns. Dr. F. W. Barry and Mr. P. G. Smith have made a report on the subject to the Local Government Board. It appears as the result of their investigations that the practice of building such houses is still in vogue in Yorkshire, and in some districts is on the increase. The result is the "huddling" together of houses and the crowding of the people upon a small area in a manner wholly inconsistent with health. Architecturally there is not much difference between the "through" houses and the "single" houses, except that in the latter the party walls are often less efficient. The cost is less, but not much less. On the other hand, the accommodation afforded in "through" houses is usually superior to that afforded in "back-to-back" houses of a similar extent. Whilst sanitary arrangements have generally improved, there has been little or no improvement in the ventilation of these "single" cottages. We shall notice the report, which is a useful one, at greater length next week, or as soon as space permits.

THE approaching meeting of the Institution of Mechanical Engineers is to be held in Dublin on the 31st inst. and two following days, and transferred to Belfast on Friday, August 3. On Tuesday next the first meeting will be held in the examination hall of Trinity College, when the president, Mr. Edward H. Carbutt, and the council will be received at 10 o'clock by Lord Rosse and the members of the local committee. The president will deliver an address, and papers will be read and discussed. At 1 o'clock the Reception Committee will entertain visitors to luncheon in the dining hall, and at 2 o'clock will give them a trip in Dublin Bay in a special steamer to view Alexandra Basin, the departure quays, the dredging apparatus, the Bailey Lighthouse, and Kingstown. At 7 p.m. the annual dinner will be given in the great hall at Royal University. On Wednesday the reading and discussion of papers will be resumed at 10 o'clock in the examination hall, and after luncheon, at 1 p.m., the visitors will be taken by special tramcars to the works of the Great Southern and Western Railway at Inchicore, or to the Rathmines Waterworks; and in the evening there will be a *conversazione* at the Loyal Irish Academy House in Dawson-street. On Thursday visits will be paid to Power's distillery and Guinness's brewery, and in the evening a special train leaving Amiens-street Terminus at 7 p.m. will carry the visitors to Belfast. Such as desire to see the Bessbrook and Newry electric tramway will proceed by the ordinary 2 o'clock train. On Friday at 9.30 there will be a reception to the president and council by the Mayor, Sir J. Haslett, and other members of the local committee. At 1 o'clock the visitors will be entertained at luncheon by the Mayor and local committee, after which they will have a trip round Belfast Lough, by invitation of the Belfast Steamship Company, to see the new dock-dredging operations and View Island Lighthouse, and at 8 p.m. there will be a *conversazione* in Queen's College, Belfast.

A METROPOLITAN improvement is just being effected which will make the approach to Charing Cross-road, running from Trafalgar-square to Oxford-street, more accessible and less dangerous. What with the railings of the National Gallery on the one side, and the steps of St. Martin's Church on the other, the thoroughfare was at this point restricted like the traditional neck of a bottle. For a long time the authorities of neither gallery nor church would yield an inch; but ultimately the former gave way, and what was a perilous corner has now been cut off, and the new piece to be added to the roadway will in a day or two be fit for use.

THE Council of the Society of Arts has received a grant from the Court of the Goldsmiths' Company of £50, to be awarded in prizes for the encouragement of workmen connected with the goldsmiths' and silversmiths' trades:—A cup or sugar basin of beaten silver, chased or otherwise, made within the year 1888. First prize, £20; second prize, £5. A pendant, or brooch, or locket of gold without gems. First prize, £20; second prize, £5. The articles for

competition must be sent in to the Society of Arts House on or before Tuesday, April 23rd, 1889. The conditions under which these prizes are offered are the same as those for the prizes for pottery, stone-carving, and wrought-iron work which have been previously announced.

THE arrangements for the approaching visit of the Royal Archaeological Institute of Great Britain and Ireland to Royal Leamington Spa are completed. The patrons of the meeting include the high sheriff of the county, the Archbishop of Canterbury, the Marquis of Northampton, the Right Hon. A. W. Peel (the Speaker), and others. Lord Leigh is president of the meeting. There will be three sections—the antiquarian, historical, and architectural. The opening meeting will take place on Tuesday, August 7, at the Town Hall, an excursion to Stratford will follow, and in the evening the antiquarian section will be opened. Wednesday will be devoted to excursions to Banbury and the opening of the historical section. On Thursday the annual meeting of the members will take place, and in the evening there will be a *conversazione* in the Town Hall. Friday will be devoted to excursions and sectional meetings; and on Saturday there will be an excursion to Coventry and a sitting of the sections. On Sunday there will be a special service at the parish church; and on Monday, Tuesday, and Wednesday, the 13th, 14th, and 15th, a succession of excursions to Hatton and neighbourhood, Leicester, Melton Mowbray, and Ratcliffe College.

AT a Special General Meeting of the Association of Public Sanitary Inspectors, called for the revision of rules, held at Connaught Mansions, Victoria-street, S.W., on Saturday, 21st inst., Mr. Hugh Alexander, chairman of council, presiding, it was unanimously resolved to add to the title of the association, the words, "of Great Britain." The president, Mr. Edwin Chadwick, C.B., who was unable to be present, addressed a communication to the chairman, approving the proposed enlargement of title. The full title of the association will be, in the future, "The Association of Public Sanitary Inspectors of Great Britain." Fifteen members and associates were elected, and Mr. E. Lewis Thomas, M.A., was unanimously elected "honorary counsel." It was announced that the association had received and accepted an invitation from the Mayor to hold a meeting at Brighton in August.

MR. A. H. KERSEY, A.R.I.B.A., is the architect for the new buildings to be erected at Westminster on the site of the Aquarium. The main front in Tothill-street will present a very imposing facade, at the Broad Sanctuary end of which a tower will rise, to emphasise the grand hotel which is to face Westminster Abbey. At the other end of the site, where the Aquarium theatre now stands, a series of flats is to be erected, and in the central portion of the buildings furnished residential chambers are to occupy the upper floors, the lower part being devoted to spacious offices. One leading feature in the hotel, besides ample dining-rooms and othersimilar apartments, will be a very large staircase, up which it is said the traditional coach-and-six could be driven with ease. A club for the use of the occupiers of the residential chambers is to be incorporated in new buildings, with a music gallery and other conveniences. Three large archways of somewhat ugly design lead to the inner courts, and the smaller entrances and lifts seem ample, and are conveniently placed. The design of the buildings may be described as a picturesque rendering of Continental Renaissance, with built-up gables and large windows, divided by mullions and transoms, grouped in bays which rise alternately into chateau-like dormers above the main cornice, which is 63ft. above the ground-floor level. The height of the ceiling of the top floor of the hotel from the same point is 110ft. The roofs are enlivened by a double range of dormers. Red brick will be used for the walling, with stone freely used for dressings. A balcony from the first-story rooms runs the entire length of the buildings, and in addition to this an open loggia is contrived at the same level to the hotel.

At a meeting of the City Commissioners of Sewers on Tuesday at the Guildhall, a long discussion took place on the old and often debated topic of the relative merits of the three

different kinds of asphalt pavements supplied by the several companies to the Commissioners. Mr. Judd introduced the subject on a motion requiring the engineer to make exhaustive experiments in order to test the relative qualities of each, so that the Commission may know which is best suited to the traffic of the City. Mr. G. Rose-Innes seconded the motion, contending that it was time to settle the question what was the character and the traffic for which each is best suited. Mr. Deputy Clerk moved the previous question. It would be wrong for them to destroy competition, and objected to spending the ratepayers' money that one particular company might get splendid advertisement. Besides that, who might be the best asphalt now might not be the best a year hence. The previous question was carried by a large majority.

PRINCE ALBERT VICTOR paid a visit to Bridlington Quay last week, and formally opened the Royal Marine Parade, Bridlington Quay, although a comparatively small town has spent no less than £120,000 in providing protection from the sea, and at the same time to enhance the attractions of the place by providing an extensive marine promenade, the ratepayers have now accepted an additional burden to the extent of £10,000. The new wall extends along the North Cliff 284 yards, and has been executed from plans prepared by the Local Board's surveyor (Mr. Dyer) by Messrs Whitaker Brothers, Horsforth. The concrete base extends to a depth of 7ft. 6in. below the bed of clay on which the cliffs stand. There is also a backing of concrete. The wall itself has been carried 20ft. above high-water level. Its thickness averages about 12ft. 6in. at the base and about 3ft. at the top. The escarpment is broken at intervals by immense buttresses, and there are flights of stone steps 10ft. in width. There is an asphalted footway along the top 14ft. wide and a carriage drive 23ft. wide.

THE employees of Messrs. John Howe and Co. of the well-known Cocklakes Alabaster Works, Carlisle, went to the Glasgow Exhibition last week for their outing this year, special carriages being provided, and a thoroughly enjoyable day was spent. We notice that the opening out of the new quarry in the east end of the Cocklakes bed of alabaster is approaching completion, and probably the finest head of alabaster ever seen in this country is now uncovered. The opening out of the above bed has practically taken five years, the work comprising a tunnel through the alabaster 41 yards long, along which it is proposed to run the locomotive, the stuff being hewn in galleries running into the same. In the old quarry this gives, together with the open space, a working face of nearly 600 yards, the bed being about 25ft. thick. The new quarry is to be worked open from east to west, the alabaster being continuous between the two quarries. Architects and others desirous of viewing the formation and obtaining information respecting this valuable material will be shown over upon application at any time.

### STATUES, MEMORIALS, &c.

THE FORSTER MEMORIAL.—The memorial tablet bearing a medallion portrait of the late Mr. W. E. Forster has been completed and is to be unveiled in Westminster Abbey by Lord Knutsford to-day at 4 o'clock. A 4ft. model of the statue has been approved by the committee, and can be seen by subscribers on presentation of their card at Mr. Pinker's studio, 22, Avonmore-road, Kensington. It is expected that the full-size statue will be ready for erection early in 1889. A site upon the Thames Embankment, opposite the London School Board offices, has been provided by the Metropolitan Board of Works.

The liquidation of the British Patent Glazing Company is complete, with the result that there is a balance of £127 14s. 10d., and the magnificent dividend of 4d. in the pound for the ordinary creditors. The liquidation expenses have been £398 17s., besides £100 paid to the lawyers.

Mr. John Hepper, chairman of the Leeds Central Parliamentary Division, laid a memorial-stone to a new Conservative Club at Stanningley on Saturday afternoon. The building is to be erected from designs prepared by Messrs. Kendall and Bakewell architects, Idle, at an estimated cost of £1,250.

**CHIPS.**  
At a largely-attended meeting of master umbers, journeymen, and medical men, held in verpool on Monday evening, under the auspices the Worshipful Company of Plumbers, resolutions were adopted affirming the desirability that umbers should be registered, and a local council is formed to promote the registration movement. Stoke-upon-Trent parish church, after being used for some weeks, during which period the terior has been renovated and repainted, was ened for Divine service on Sunday week. The rk of renovation has been carried out under a ntract by Messrs. Eardley and Son, of Newcastle.

VOL. LV.—No. 1752.

FRIDAY, AUGUST 3, 1888.

## NATIONAL COMPETITION OF SCHOOLS OF ART.

THIS year the prize works and drawings submitted by the various Schools of Art throughout the country are partly located in one of the galleries of the court formed by Sir F. Leighton's great fresco "Arts of Peace," the screens being placed on either side of the collection of images and Byzantine enamels. Another part of the exhibition is placed in the iron buildings adjoining the Architectural Courts. In such straits are the committee driven in housing these yearly works, that the permanent collection is encroached upon—a state of things that is necessitated by the dilapidated condition of the buildings of the Science and Art Department, which are literally neither wind nor watertight. The number of works sent up for examination was 78,730, from 237 Schools of Art and branch classes, a considerable reduction from the number of previous years, owing to the new regulation, which has materially cut short works in the simpler branches. Of this total number 2,473 in advanced stages have been selected, showing an advance upon the number of last year. Eight gold medals have been awarded to schools at Cork, Edinburgh, Glasgow, Ipswich, Leeds, Macclesfield, Manchester, and Stoke-on-Trent, five of which are for designs in stages 23c and 23b. Forty-two silver medals, 113 bronze medals, and 233 book prizes have been given in addition to the honorary awards made to training-students.

To begin with the Architectural work. A Leeds student, Charles B. Howdill, obtains the gold medal for a design for a post-office, the features of which are a public entrance on one side with high tower, a front public office, and a sorting office behind; the style a Renaissance version, in which stone is the material. A large-scale ink elevation is sent. John Frederick Wilkinson, Kendal, receives the silver medal for a design for a cathedral church, a design displaying infinite labour and mechanical skill and neatness, but lacking in artistic feeling and in good architectural proportion. Of course, the Per-florid Decorated style is selected; there the full complement of towers—two eastern and a central tower, all crowned by piers rivaling the glory of Lichfield, and a transept (which is not hung) in which the usual accessories of a cathedral church are brought together. The low proportions and the eagre flying buttresses, to say nothing of the tail, are defects in design. The draughtsmanship is perfect as a *tour de force* of mechanical accuracy. A silver medal is also won by Thomas Redfern, Manchester, for a design for the decoration of a restaurant, Pompeian in style and chaste in treatment, with a nice key of colour. A silver medal is awarded also to H. Baynton, a student of the Training Class, South Kensington, for a Municipal School of Art, Italian in design. The fenestration is bold, with sculptured pinnacles. A heavy curved roof with flat top soils the design, which is drawn and shaded in sepia. A very clever design for a mountain chapel, by Chas. R. McIntosh, Glasgow, takes a bronze medal. The plan is simple and well grouped. A low tile-roofed tower forms the vestry, attached to a vestibule and porch. A single-span tiled roof, hipped at end, covers the church; the walling is of a bluish-grey "rag," making a pleasing contrast with the red tiles, and the details are simple and effective. Frank Bailey, Nottingham, receives

a similar prize for a design for a museum and art gallery—a Gothic treatment with central tower, having a rather stumpy termination. A bronze medal is also bestowed on Arthur H. Hinds (Leicester) for a post office (one of the Institute drawings previously noticed by us), with some good Classical detail in it; also on W. H. Higginbottom's design for a church—a very ornate design, having domical towers with lanterns at east end, and two western towers and spires, somewhat German or Rhenish in type.

A bronze medal is given to W. H. Borland, Plymouth, for a design for a country residence, Elizabethan in style. There is some carefully-drawn detail; but the design is rather too broken up. We notice another good plan hung lower down, also a Gothic half-timbered and stone design by Edwin L. Lutyens, South Kensington. W. H. Midgley, Birmingham, has a bronze medal for a design for a modern church, illustrated by photographs from a sketch in clay; the plan is a Greek cross with dome, the details are coarse and heavy, and the windows mere slits. A book prize is given to A. C. Breden, Regent-street Polytechnic, for a design for a country house; and a half-timbered cottage in brick is also noticeable for good treatment, by Frank B. Cooper, Leicester. A Late Gothic design for a Village Institute takes the same prize, the author being Charles B. Howdill, of Leeds.

Other drawings include designs for iron-work, decoration, &c. The entrance gates by Stanley Baugham, Coalbrookdale (bronze medal), have boldly treated wrought and hammered panels; a design for the same object by Samuel Sillitoe, Manchester, intended for a church porch, is very effective in the panels (bronze medal); and measured drawings of iron gates by Thomas Reed, of Derby, take a book prize. The same award is bestowed on Michael Baugham, Coalbrookdale, for some good wrought-iron railings. A design for dining-room decoration by Arthur E. Pearson, Manchester, is somewhat heavy—there are painted panels and frieze; William H. Allen, a training student, sends an effective design for the decoration of a music room; Graham S. Nicholas, Scarborough, has a book prize for a suburban residence, Dutch, in red brick, ornamental gables and stone dressings rather spotty in appearance. We must also notice a pleasingly treated garden refreshment room with tile roofs, by Frank Lee, Sydney, N.S.W.; and a design for a church by W. S. Sweet, of the same place; also a clever design for an exedra joined to a billiard-room, by Arthur Jemmett, Westminster; all these receive book prizes.

The measured drawings are not so numerous as they have been. The Gold Medal is given to Percy Adams, of Ipswich, for his carefully delineated drawings and details of Dennington Church; we illustrated on May 18th Mr. Adams's drawing in this set of the screen. A silver medal is awarded to William James Anderson, of Glasgow, for drawings of church at Queen's Park, in that city, designed by A. and C. Thomson, in the Greco-Egyptian style; the drawings were reproduced by us on April 13th and 27th last. The details are well drawn. Larmont Penman, also of Glasgow, is awarded a bronze medal for drawings of St. Vincent U.P. Church, a Greek hexastyle Ionic, very neatly drawn; and William Allan takes the same prize for details of entrance to a church, showing some cleverly drawn incised Greek ornamentation. A less satisfactory Classic church is drawn by William T. Connor, Glasgow, which receives a book prize. Amongst other measured drawings we notice those of Cartmel Priory Church, by Walter S. Whitworth, Barrow-in-Furness, a fine Perpendicular edifice with low central tower, drawn in sepia; the porch of St. Edmund's, Southwold, of flint and stone—a

good example of flushwork, by Percy K. Allen, Nottingham, both receiving bronze medals; drawings of stalls in St. Mary's Church, Whalley, by John Rufus Lee, Burnley; sepia drawings of St. Kynaburga Church, Caistor, Northamptonshire, a fine Norman example of tower, by Hubert Walker, Peterborough; drawings of a chancel screen, Fitzwarren Church, Somerset, by Walter Fuge, Taunton, and the tower of St. James's in that town; a drawing of north-west tower, St. Paul's Cathedral, by Robert Bryden—all these taking book prizes. The modelled designs are creditable. A low relief design for a frieze is a graceful composition, worthy of the silver medal awarded, to Frederick Shelley, of Hanley; the modelled design for a bread-tray, by Ethel Atcherley, Manchester, is also refined, with low relief figures. We must also mention Ethel Gladys Huxley's design for the Slade School medallion as clever.

Gold medals are given to Caroline C. Beatson, for embroidery lace design; to Thomas J. Donohue, Macclesfield, for a clever wall-paper, with foliage, animals, and birds in sombre tones of colour.

The bronze-medal works are also promising. We particularly mention a design for a jardinière, by Arthur Boulton, Burslem, a design for a pedestal in terracotta, by Joseph Simpson, Hanley; designs for panels by President J. J. Brookes, Manchester Technical School. Maria T. Pearce, West Bromwich, wins a bronze medal for designs for panels for a pianoforte, the figures of dancing amorini all spirited. A modelled sketch of duck by C. W. McKechnie, Birmingham, is clever, and takes a silver medal. Silver medals also go to Emily Anderson, Cork, for lace borders; to Emily Batters, Hertford, for a tile design, in which brown star-like patterns with blue circles are introduced; to Samuel H. Moss, Macclesfield, for a tile pattern with intersecting circles and foliage in buff, red, and black; to Mildred M. Hall, Manchester, for a majolica plate, the motive being the spirits of Calm and Storm, a bold design, also some designs for terra-cotta. Ella and Gertrude Ginn, Hertford, receive bronze medals for designs for tiles and wall-paper; Edith Newton, Manchester, for a design for a monument of Liberty, details well drawn; Frederick E. G. Smith, Brighton, for a design for altar-frontal. Designs for hangings and wall-papers are not numerous. Constantine Procopides, Dora Robinson, and Fanny Royland, Manchester, send creditable designs for silk fabrics; Minnie Aumonier, West London, a mosaic design for floor-cloth.

We have no space to enumerate other designs. The chalk drawings from the antique comprise several works of merit. Hannah McGoun, Edinburgh, receives gold medal for "Silenus nursing the infant Bacchus." The monochrome oil-paintings from the antique include Oliver Silk's (Liverpool) disc thrower; John H. Parkyn's (Bristol) "Silenus with Bacchus," both awarded silver medals. Draperies arranged on the antique figures receive attention. Robt. Bryden, South Kensington, has a sleeping faun draped, drawn in chalk. Frederick Earles, of the Training College, and Laura Butcher, Wakefield, are other contributors. William Coe, Islington, shows several studies of drapery, and a chalk drawing of hand and foot, for which a book prize is given. The chalk drawings of hand, from life, by Charles T. Howard, Boston; the figure from the antique, by Catherine Stevens, Brighton; John W. Sothern's (Glasgow) drapery arranged on the antique figure; Ethel Buckingham's (Norwich) monochrome painting in oil from the east, and the work of another Norwich lady, Gertrude E. Offord, a monochrome oil study of ornament from the east, are noteworthy; they take silver medals. Of the nude figure

studies, Ernest Fabian, South Kensington, wins a gold medal for a clever model in plaster of a youth seated on the trunk of a tree, his head turned, and one hand on his hip.

Albert Baker, Stoke-on-Trent, takes a gold medal for water-colour studies of fruit, foliage, and flowers. The vine, with its clusters of black grapes, the sprays of white blossom, and other flowers, are rendered with charming truthfulness. Maud A. West wins a silver medal for a group of book flowers and drapery; the same prize is won by Robert E. Groves, Leicester, for a group of flowers in water-colours. Two groups in oil-colours of exceptional merit in composition and colour receive only book prizes. We allude to the groups by William Higgins and Ernest Jefferies, both of Birmingham. One, a group of oranges in a tazza, a branch of laurel leaves, and a relief background; the other, a broken pomegranate with lamp and evergreen, a stele representing the background. Maud A. West (Chiswick) and Agnes Bell (Clapham) send oil groups, the latter nice in colour, for which book prizes are awarded. Francis Reilly (South Kensington), student, receives a bronze medal for a nice group, comprising a silver tankard or cup, with grapes and relief background, admirable in its quiet key of colour; and Mabel E. Hobson a water-colour group of flowers and vase. We must also say Katherine L. Beard's group of mother-of-pearl plate and drapery is worthy of a higher prize.

#### HALLS AND STAIRCASES.—II.

THE planning of a hall and staircase of small proportions requires often more skill and contrivance than a large one where the space is unrestricted. As we have pointed out, the ordinary designer makes his hall and stairs fit the space he can spare, instead of first arranging the plan of hall to suit an easy-graded staircase that shall be an ornament rather than a feature that must be got out of sight, and placed in any corner or recess. Some of the revivers of the Queen Anne could hardly have done more to traduce the interior character of that style than to put into respectable middle-class villas the worst form of newel and dog-legged staircase in which winders are largely introduced, with short flights of flyers. Some of the stairs we have had the curiosity to notice of this kind are so very abrupt and awkward as to be worthy only of a place in a labourer's tenement. It is quite impossible to turn a piece of furniture, like a piano or sofa, round a narrow, dog-legged staircase. Yet all at once the artistic merits of the newel and winders have found admirers. The massive newel of 6in. or 8in. square, boldly turned or carved, the handsome moulded and capped close-string, and the well turned balusters and ramped handrails were thought to be attractive features after the *pseudo*-Classic mania and the Nicholsonian staircase-making era had gone by. The joiner's ideal—the geometrical staircase, with its "wreathed" handrails, had long taken possession of the architect's mind, and rendered a change, when at last the more vernacular styles were revived, acceptable. The curvilinear or geometrical arrangements of stairs were speedily set aside for the rectangular. The clever joiner's model was the outgrowth of the contracted hall of the modern house; but it did not survive the change of taste in architecture. The stone staircases of the palatial residences designed in accordance with classical traditions were, of course, only to be found here and there, and in public buildings. So it was that the wooden types of staircases found in the old halls of the 16th century were eagerly taken. The winding staircase of Arden Hall, near Manchester, with its central newel post,

all of oak, put together with oak pins; or the one at Bramall, composed of solid blocks of oak, are examples; several others of the 16th and early 17th centuries, found in Cheshire, Derbyshire, and South Lancashire, present excellent models of woodwork staircases. The student has further the noble examples of Haddon Hall and the old English mansions, of which several are shown in Habershon's "Half-Timbered Houses," Nash's, and Richardson's

works. There was, moreover, in this type of staircase and hall something that was picturesque and truly national. The old halls awakened associations, "half legend, half historic," an air of comfort pervaded them, and the charm of poetry and romance was thrown over them.

We here consider the second division of our subjects, or halls at the side.

This is an arrangement that will suggest itself as the best for houses of several stories, or where top lighting cannot be so easily obtained. The hall, too, can be made an external feature, and the staircase pronounced as a tower or bay projection. Many of our detached suburban villas afford instances of the side hall and entrance, though too frequently these are cramped,

and the opportunities of making them effective and giving a good impression to the visitor are lost. The space allotted to the hall is one of the first considerations in planning—how large it can be without restricting the size of the rooms, rather than how small it can be made. Its primary use, that of giving access to the rooms from the stairs, is not the only one; a hall is a reception apartment into which the visitor first

enters, and by which he receives his first impression of the house. In connection with a small plant house or conservatory, the side hall might be rendered a very charming apartment. We shall show how this can be done as we proceed. Here we may properly mention one or two other more essential things in the planning of a small hall at the entrance. First, it is necessary that the doors at least should be passed before the visitor can be said to be in the body of the house, an arrangement necessary to prevent draught and insure internal warmth and comfort. In short, this is best insured by an outer hall or entrance vestibule and an inner hall, and no well-designed entrance should be without this double arrangement. In a private residence an outer hall, porch, or vestibule, whichever may be called, is better planned on two axes, not in a line with one another. Thus a vestibule may open laterally into the hall. The object of this arrangement is to avoid the intrusion of unwelcome visitors into an internal hall, which really becomes an inner apartment of the house. Second, it is a doubtful advantage in a domestic building to be able to see through in a straight line from the entrance door to the inner hall, though the modern builder appears to like this arrangement, favoured as it is also by many tenants of ostentatious predilections.

second plan with vestibule at right angles to the hall shows an arrangement that can be rendered attractive, especially if opposed to the front door, against the wall a few ornamental plants or jardiniere could be placed. In our last example is shown another better arrangement for a large house, the inner hall being closed off by a glass or painted screen with doors from the vestibule and the hall made an attractive and well-lighted ante-room to the billiard-room or drawing-room. The addition of a conservatory in this arrangement, opening into the vestibule, is a feature that well recommends itself to all who like to add the grace of plants, flowers, and statuary to the interior of the hall.

The staircase, as we have hinted, may become the central and prominent object of the hall, or be lateral to it, and hidden, partially screened off. Our first plan of the stairs made a central object in the hall. The passage to the offices on one side and the return flight on the other, give the centrality. Round the hall, which is well lighted by a window at the side, are placed the doorways of the dining-room, library, and drawing-room. The entrance doors to the side wall of vestibule, thus preventing direct view being obtained into the hall, a second glazed door being placed between the outer and inner hall doors, very different arrangement of the stairs is indicated in the second plan. Here they are screened from the inner hall by an arched doorway, a mode of dealing with the stairs which enables it to be kept as quite private if not subordinate in its treatment

character. The lateral stairway can generally be arranged in this way, and lends itself to many architectural treatments. The only requirement is that it should be well lighted. Windows at the back or staircase wall. The openings can be filled with grisaille or painted glass subjects, or hung with curtains. We are speaking now of halls of some size in private residences of a superior class; the treatment would be out of place in ordinary houses, and look more pretentious than justified. One important arrangement of a hall with staircase is that indicated in our last plan, in which the first flight is made to ascend towards the entrance front. An obvious advantage to this mode is that visitors or strangers cannot see anyone going up stairs, the first flight is rendered private, while it is convenient to the doorways of the main reception rooms. The servants' stairs is so compactly brought into communication, and both can be well lighted through the clerestory walls. The plan suggests itself as one suitable for town houses.

### THE METROPOLITAN BOARD OF WORKS INQUIRY.

THE Royal Commission resumed their sittings on Friday, when the first witness called was Mr. James Beal, who said that Mr. Furniss, contractor for a section of the Thames Embankment, was allowed to fill up the reclaimed land with rubbish which he obtained from builders and others, instead of material taken from the bed of the river. He was sure that Sir J. Bazalgette's evidence could not be sustained in this respect. Macadam material laid afterwards to be used in consequence of the sinking of the stuff that was put in, and this involved an expense of thousands of pounds to the ratepayers. Mr. Ridley's tender was the lowest, and he was ready to deposit £30,000; but the contract was let to Mr. Furniss, for whom three members of Parliament at the time became sureties. Those members were Mr. Doulton, Mr. Jackson, and Mr. Staniland, one of whom, the witness said, received £5,000 for becoming guarantee. Lord Herschell: Apart from the question of Mr. Ridley's being the lowest tender and the other higher, it did not matter to the Board whether it was made by deposit or sureties?—Witness: I think it did. Have you anything to show that the Board knew of the arrangement when you say it was corrupt?—If you have a list of contractors and the names of the sureties; if you have contracts for millions given to one man, the engineer of the Board the sole arbitrator as to extras, and the amount of extras let out, you have your lesson. You will see the whole thing. Lord Herschell: There is a deal beyond that if you want to see the whole thing. Continuing his statement, the witness thought that the balance kept at the bank was too large, the Board borrowing money from the public at 3 per cent, and receiving only 1½ per cent. from the bank. The chairman of the Board, he thought, should sign all cheques; but Lord Magheramorne could not do so, having come into an estate which required him to live in Ireland three months in the year. Lord Herschell remarked that the witness referred to by the witness could surely be discharged by the chairman of the Finance Committee.

Mr. William Webster stated that he was the father of the late Mr. William Webster, contractor. He did not personally know of the other contracts carried out by his father for the Board of Works. Witness commenced his evidence in March last. His father's firm had taken any contracts since 1832-33, but his father's business was carried on until December, 1886, when the partner was Mr. Staniland, formerly of Boston. The books of the firm were destroyed when the partnership was ended. Mr. Bosanquet: You have a contract with the Board yourself?—Yes for the precipitating tanks and reservoirs at Crossness. Was that advertised for public tender?—Yes. Had you anything to do there before your tender was accepted?—I had commenced in January some experiments at my own expense in reference to an electrical invention for treating sewage. Was your tender accepted?—In May.

Mr. Mark Judge said he was foreman of the coroner's jury who made an inquiry into the fire at Mr. Whiteley's in 1887. Much surprise was expressed by the jury at the extraordinary rapidity with which the fire spread throughout the several buildings. Lord Herschell: The jury on that occasion made certain recommendations relating to inquiries respecting fires, and to the serious danger which might result from unscientific construction?—Yes. On that occasion Mr. Saunders, who was architect of the buildings, gave evidence?—Yes. And also Mr. Gundry, the district surveyor?—Yes.

Mr. Alderman Saunders, recalled at his own request, emphatically denied that he put any pressure whatever on Mr. Villiers with a view to being employed as architect of the Pavilion Music Hall. Mr. Villiers went to him as an ordinary client, and he received him as such as a man of honour. He repudiated a suggestion that his professional ability was not such as to justify his appointment as architect to the Pavilion. During a career of 30 years buildings had been erected by him in all parts of London which disproved the imputation. Where the evidence of Mr. Villiers was in conflict with that which witness had given at an early stage of these proceedings, he saw no reason to alter the statements which he had already made. Lord Herschell: According to you, Mr. Woodward first came to you and simply introduced Mr. Villiers to ask for your support, and nothing was said about your being architect?—That was my impression, and it is so still. Did you speak to Mr. Woodward about Messrs. Isaacs and Florence posing as architects for the Pavilion?—No. Mr. Woodward is in error. Sundry architects were pressing Mr. Villiers for the position of architect. I have been many years in the profession, and I believe I have never done a dishonourable act. Lord Herschell: Just attend to the questions, and do not make general observations. Witness: Yes, your lordship, but an imputation was implied. Before Mr. Villiers had come, had Mr. Woodward asked you about acting as architect for Mr. Villiers?—I think there Mr. Woodward was in error as well. My belief is that a question was asked me either by Mr. Villiers or Mr. Woodward whether there was any objection or difficulty in my acting as architect. I stated that there was no objection in my acting if he wished me to do so, and that I should feel it an honour, being a good building. But I said, as a member of the Board, if I did act, I could not vote or take part in anything to do with himself or his property. When you said that you could not vote for him, did you add that there are more ways of killing a cat than hanging it?—No; I should say that is more likely to have been said by Mr. Villiers than myself. Did you say, "Do I understand I am to be your architect?"—Not on that occasion. That was six weeks or two months later. As time was pressing I wanted to know who was to act—whether Mr. Worley or myself. The witness, in further examination, said he wanted it to be clear that he knew nothing of any relation between Mr. Villiers, Mr. Goddard, and Mr. Robertson. He had no recollection of any conversation with Mr. Robertson about the Pavilion site. Asked as to his connection with the Criterion Theatre, witness said he advised on the plans and as to the new entrances. He was a member of the Theatres Sub-Committee which had to deal with these questions. It did not strike him as improper to accept a retainer in such a case. Were you not present when this matter came before the committee?—Apparently on one occasion I was. You moved a resolution on one occasion?—Yes. There was no record on the minutes that you were professionally engaged?—There was not. Will you swear that you told the committee you were professionally engaged?—Not in that particular instance, but I could in others. With respect to the Cook Tavern, in regard to which witness was engaged as joint architect with Mr. Verity, he said that he was first employed in that case, and plans were prepared in his office. He served notices on neighbouring owners and negotiated with them. For these services he received £450. The buildings were not completed, the site being afterwards sold by Messrs. Spiers and Pond. With regard to Mr. Bird's evidence, he prepared plans and tracings for the Albany-road estate at Walworth, and advised as to

frontages. No question was ever raised as to payment of his fees for this until four years afterwards. He had then erected other buildings for Mr. Bird, and charged in his account 50 guineas in connection with the Albany-road estate. Mr. Bird's previous plans had been rejected when you were engaged?—Some had. You were advising on fresh plans that would go before the Board?—Yes. Before the Building Committee?—Yes. And you were a member of that committee?—I was. Did not that seem to you a questionable proceeding?—No. You must remember that unless a professional man is to go out of his profession he must have a few cases out of hundreds which come before the Board. That may be all very well, but if there are only a few cases out of hundreds, a man need not go out of his profession in order to avoid dealing with matters that come before the Board?—I could not say that I would not touch the work. If you could not refuse any professional work in consequence of your position on the Board, you could resign that position?—Of course I could. Mr. Studd called the witness's attention to a resolution which he had proposed as deputy chairman of the Building Act Committee, and Mr. Saunders remarked that the recommendations of committees were often moved *en bloc*, and at that time he did not know that this particular resolution was included in the committee's report. Respecting the evidence of Mr. Francis, the witness said that he gave great attention to the supervision of the erection of the Grand Hotel, and some of the plans were executed in his office. He did not know before the site was obtained that he was to be joint architect. It was a mistake to think that he could bias the Metropolitan Board of Works. The members were a great deal too sharp to allow any one member to influence them. By Mr. Bosanquet: When he said that he would give proper consideration to Mr. Villiers's application for the Pavilion site, he knew that, as an old tenant of the Board, having paid a high rent for years, he was deserving of the first consideration. Asked if Mr. Woodward, who was a former assistant in his office, had shared with witness fees which he had received in compensation cases, Mr. Saunders said he believed that Mr. Woodward received the whole. Very often a principal assistant was allowed to practise for himself. He thought Mr. Woodward was mistaken in his evidence in this respect. By Mr. Studd: Witness advised Mr. Gordon what to tender for the Grand Hotel and Hôtel Métropole sites. Do you think that was a right thing to do?—Yes. I was exceedingly proud to be able to get such good tenants, the previous tenders having fallen through, and I knew they would carry out their contracts. My impression is that I ought to be thanked. Lord Herschell: Are there any other transactions that we do not know of in which you advised and which came before the Board? Witness: Not that I know of.

At Tuesday's inquiry Mr. H. Harber, a member of the Metropolitan Board, said he thought Mr. Vulliamy, the late architect, in the latter years of his service at the Board lost entire control over his subordinates; in fact, that his subordinates ruled him. Witness pointed out to Mr. Fowler, then deputy-chairman, the scandal which might arise unless there was greater control over the architect's department. He spoke to Mr. Vulliamy with a view to his resigning, in order that they might entirely clear out Mr. Robertson and Mr. Goddard, as he had secondary evidence which convinced him that they were not honest.

Mr. Verity, architect, recalled, said that the evidence given on Friday by Mr. Saunders was inaccurate. It was absolutely true that in connection with the Cook Tavern site Mr. Saunders did practically no work at all. He neither negotiated for the site nor made a plan of it. The only work Mr. Saunders ever did, so far as witness knew, was to fill up the Building Act notices from the information which he gave to him. It was not the fact that Mr. Saunders was appointed architect first. Witness never had a single interview with him as to the Criterion, but paid him for his clients a cheque for £450 for services in connection with that building, although ostensibly it was given for the Cook Tavern.

Mr. Haines Rowell said that he had the supervision of the works carried out by the late Mr.

Webster, contractor. They were executed according to contract, unless there was some reason on some occasions why they should deviate. He knew of no cases in which the work was diminished without deduction being made.

Mr. John Crowe, for 30 years manager of the indoor department for the late Mr. Webster, said Mr. Webster made loans to members of the board, including Mr. Frederick Doulton, Mr. William Newton, and Mr. Fowler. He ought not to call Mr. Fowler's loan probably. There was a debt standing from the Opera-house. Some question arose about a new design for the National Opera-house. Mr. Webster undertook to pay for it, and if the new design were a success he was to pay £500, and if it was not a success £250. He paid £500, and afterwards told Mr. Fowler that there was £250 due from him.

Sir J. Bazalgette, recalled, stated that not rubbish, but good solid clay, was deposited as filling-in of the Embankment. Are you aware that people paid the contractor for being allowed to deposit rubbish there?—I believe there were a few cartloads paid for. Others came from a distance, when the contractor paid for them. That was a matter I had nothing to do with. Sometimes considerable sums are paid for permission to deposit rubbish?—It depends on the distance that it has to be carried. It is a matter as to which I, as engineer, should not interfere in the least. The statement that there were settlements in the Embankment which had to be filled up with macadam at great cost to the ratepayers, had no foundation in fact.

Several members of the Building Act Committee stated that they had no knowledge that Mr. Saunders and Mr. Fowler acted professionally in relation to the Albany-road estate and the Criterion Theatre.

Mr. Furniss, a member of the Board, was questioned by Mr. Winch as to his receiving two tickets for Drury-lane Theatre from Mr. John Hebb. He denied that he had asked Mr. Hebb to write for the tickets. The tickets were used by members of his family.

The Commissioners adjourned to Tuesday next.

#### PRACTICAL ARCHITECTURE WITH DETAILED ESTIMATES.—IV.

By HENRY LOVEGROVE, F.S.I., Surveyor.

##### TILER.

38. **TILING.**—Cover the roofs with well-burnt, plain Broseley tiles of a strawberry tint laid to a 3in. gauge with double eaves course on 1½in. by ½in. sawn laths. The valleys to be laid with proper valley tiles set and pointed in cement, and the hips to be formed with proper hip tiles.

39. **Ridges.**—The ridges to be finished with plain red ridge tiles bedded and pointed with cement. Leave all roofs clean and perfect at the completion of the works.

**Notes.**—Measure the tiling and bill in squares of 100ft. superficial; describe the gauge, the laths, the pins, whether of oak or iron. Deduct chimneys and skylights. Allow for cutting to hips and to valleys. Run the valley and hip tiles, and extra for bedding tiles in cement to eaves by the foot run. Ridge tiles by the foot run, stating how bedded.

##### MASON.

40. **Stone.**—All stone to be of good quality, free from shakes and discoloured veins, and to be laid upon its natural quarry bed.
41. **Casing Up.**—All work exposed to injury to be properly cased up and cleaned down at completion.
42. **Hearths.**—The hearths of kitchen and scullery to be 2in. rubbed York stone. All other hearths to be of tiles, at an average cost of 12s. per yard superficial, p.c., bedded and jointed in cement.
43. **Steps to Front Entrance.**—The top step to be 14in. by 7in. rubbed York; the other steps to be 12in. by 7in. rubbed York, backs tooled chamfered; the landings to be 6in. rubbed; the step next the road to be 12in. by 7in., and the paving to be rubbed York, bedded and jointed in mortar, and laid on concrete over a brick arch. The steps down to trade entrance to be similar.
44. **Steps to Garden Entrance.**—The top step to be 12in. by 6in., the remainder 12in. by 7in.; the landing to be 2in. rubbed York, bedded and jointed in mortar.
45. **Cover Stone.**—The cover stone to be 14in. by 4in., as shown, to be 14in. by 4in., as shown, to widths.
46. **Thresholds.**—The doors to conservatory, as shown, to have 3in. rubbed York thresholds. All top steps and thresholds to be back jointed and morticed for frames.

##### RED CORSEHILL STONE.

47. **Dressings.**—The bands and arches, heads, dressings, jambs, and sills of windows, columns and cornices of porch and dressings generally, to be of red Corsehill stone of the best quality, and laid on its natural quarry bed.
48. **Workmanship.**—All to be worked in accordance with the detail drawings, and put together with all necessary joggles, cramps, dowels, &c.
49. **Carving.**—The carving to be executed by a carver approved by the architect, and the whole of the work must be carefully cleaned down at completion.
- CHIMNEY PIECES AND HEARTHES.**
50. **Chimney Pieces.**—The dining and drawing rooms to have chimney pieces £15 each p.c. The breakfast room and four other bedrooms to have chimney pieces £10 each p.c., and all other rooms to average £4 each p.c. All the above prices exclusive of fixing.
51. **Tile Hearths.**—The tile hearths in dining room, drawing room, and library to be of the average value of 12s. per yard, and to be carefully laid on a 3in. cement bed and jointed in cement.
52. **Fenders.**—Provide and fix No. 11 marble fenders to cost on the average £10 each p.c., exclusive of fixing.

### THE ALLEGATIONS AGAINST THE LONDON SCHOOL BOARD.

THE London School Board sat in committee on Tuesday to consider and "investigate any allegations of corruption," when letters were read from 24 members of the Board, stating in effect that they had no information on the subject. Mr. W. Bousfield, chairman of the Works Committee and of the Special Committee of Inquiry into the Works Department, said there had undoubtedly been scamped work in the erection of some of the schools, and this must have been known to the clerks of the works then employed by the Board to supervise the building. None of the officers now in the employ of the Board were responsible for cases of dishonest building.

Mr. Hindley, of 290 to 294, Oxford-street, W., wrote that, being invited to tender for some work, he heard, while preparing the estimate, that it was all arranged that another firm was to have the work. He informed one of the responsible School Board officials of this before the estimates were sent in, and was assured that there would be fair play, but he was surprised to find that what he had stated was actually carried out, though not by quite the same means as he had expected, and although his estimate was settled upon by the committee, another estimate was afterwards produced and accepted by the Board. That estimate was the one from the particular firm which he had heard it was arranged should have the work, and who did not manufacture their own work. The treatment he received from one of the School Board officials when endeavouring to inquire into the matter confirmed the opinion he had already formed as to the method in which the work of the Board was done. Mr. Hindley added that he should be prepared to come forward to give evidence when the whole subject was before a Royal Commission. In a second letter, Mr. Hindley stated that his tender was the lowest; but that after it was accepted another tender was "discovered" which was lower; and that when he called at the office for an explanation, he was kept waiting two hours and then refused all information, being referred to "the person who gave him the rest of the information."

Messrs. Cox and Woolard, Benham-grove, Thornton Heath, drew attention to the tenders for the Hollydale-road School at Nunhead, asking why their tender of £109 was passed and

another of £135 accepted, when in almost every other case the lowest tender was accepted. The letter added, "perhaps, had ours been a big firm, with a little influence behind us, we might have been in the know a little earlier." A letter dated from the Borough, and signed "J. M. Smith," stated that the writer could furnish particulars of the proceedings of an officer of the Board, who invariably received three payments upon the large amounts included in the estimates as provisional sums. This was accomplished as follows:—His commission included a percentage upon provisional amounts, and was paid from the first instalments received by the contractor. When adjusting the accounts a deduction was made of all the provisions, and 2½ per cent. was claimed upon the deductions. Another charge was made upon the net amount expended out of the provisions. A statement should be called for from the various builders to show the amounts paid to the surveyors for squaring up schools. It would be found that the official in question generally managed to get 50 per cent. more than other similar officers. The largest school fell to this gentleman, probably owing to his intimacy with another official. The letter concluded by expressing the hope that full inquiries would be made, which might unearth more mysteries, especially if a cheque book were called for. With one dissentient the committee decided that the various complaints received be reported to the Board, with the recommendation that they be referred to the various committees concerned.

### BUILDERS' BENEVOLENT INSTITUTION.

THE forty-first annual meeting of this Institution took place on the 26th July at Willis's rooms, St. James's, Mr. H. H. Bartlett, the president, in the chair.

Major Bruton, the secretary, read the annual reports, which stated that the income had not been sufficient to maintain the charity, and that recourse had to be made to the remainder of the reserve fund to meet the liabilities for the support of the pensioners. That fund was now entirely exhausted, and an urgent appeal was made for sufficient funds to carry on the Institution for the forthcoming year. Should the appeal not be liberally responded to, some of the funded property would have to be realised, a misfortune which well-wishers of the Institution would much regret. During the past year the committee had only been able to recommend the election of two men, although there were several candidates, and three widows of pensioners had been placed on the pension list. The number of deaths of pensioners had been eight; the total number now on the funds being 28 men and 35 women. The committee offered their grateful thanks to the president, Mr. H. H. Bartlett, for the kind interest he had shown for the prosperity of the Institution, and with great satisfaction announced that Mr. J. Howard Colls would be the president for the ensuing year. The annual dinner would be held, with the consent of the Court of the Worshipful Company of Carpenters, at their hall, on the 29th of November next.

The report and accounts were adopted on the motion of Mr. George Plucknett, J.P., seconded by Mr. T. Stirling. Votes of thanks were passed to the president for the past quarter, Mr. H. H. Bartlett; to the vice-presidents, to the trustees, and to Mr. Plucknett, the treasurer, who was re-elected. Votes of thanks were also passed to the committee, the retiring members being re-elected, with the addition of Messrs. W. Brass and G. Wall; and to Messrs. Ward, Duffield, and Baldwin, the auditors.

The Chairman proposed as president for the ensuing year Mr. J. Howard Colls, who, he believed, would do his utmost to further the interests of the Institution. The resolution was unanimously agreed to, and with a vote of thanks to the chairman the meeting separated.

A new hospital has been erected at Merthyr Tydfil, and special attention has been paid to the ventilation, Messrs. Robert Boyle and Son's latest improved patent self-acting air pump ventilator being adopted for the extraction of the vitiated air.

OUR LITHOGRAPHIC ILLUSTRATIONS.

THE SANCTUARY, DURHAM CATHEDRAL.

LAST year (in our issue of March 4, 1887), we printed, from the exhibition of the Photographic Society of Great Britain, in Pall Mall, a fine view of Durham Cathedral, showing the grand nave of that magnificent building. To-day, by the courtesy of the photographer, Mr. Wm. McLeish, of Durham, we are enabled from the same collection of notable photographs, to give a double-page plate of the Sanctuary in this cathedral, looking into the Chapel of the Nine Altars (A.D. 1242-1290), which, from all accounts, was designed by Bishop Poore, who issued indulgences to raise money for its erection in 1237. Thomas de Melsonby was prior during the early part of the work, which is of the finest Early English character. The mixed architecture of the choir adds particular interest to the church, and the new work of the High Altar Communion-rails and kneeling stalls furnish the sanctuary.

THE GRAND ORGAN FOR THE TOWN HALL OF SYDNEY, NEW SOUTH WALES.

THIS magnificent instrument will not only be the largest ever built for an English colony, but will also, it is hoped, be the grandest organ yet constructed, both as regards tone and mechanical refinements, for any building, sacred or secular. It will contain 126 speaking stops, distributed between five manuals and one pedal clavier, besides numerous accessory couplers and other movements. It will thus greatly exceed in dimensions the organs in the town halls of Melbourne and Adelaide, both built by Messrs. Hill, which contain 66 and 38 sounding stops respectively. Perhaps the most remarkable feature in the specification is the 4ft. reed on the pedal, which, it is confidently believed, will have a great effect as a bass for the full organ. It will be a striking reed of true length. The organ is being constructed entirely on the pneumatic principle, of a kind specially devised by the builders, and will be blown by a gas-engine. The case has been designed by Mr. Arthur G. Hill, F.S.A., and accepted by the Municipal Council. It will be of great size, and hold, in the centre, the 32ft. metal pipes. The style is Northern Renaissance, of the fine type seen more especially in 17th-century German work.

NETLEY CASTLE, HANTS.

THE accompanying drawing represents Netley Castle as now being enlarged and altered, from the designs of Mr. Sedding. The original structure, erected in Henry VIII.'s reign, was of comparatively small dimensions, built near the Solent, with very thick walls for purposes of defence. This structure had been since enlarged at various times. The present works

embrace the addition of a story in the two wings of the structure, with turret staircases to the same, as also extensive alterations in the external design, the heightening of the tower, the addition of new offices, and the remodelling of the fittings in the interior of the house throughout. The work is being carried out by Mr. Bone, of London, from the architect's designs.

GLOUCESTER BATHS.

WE illustrate the selected design for these buildings, as modified for execution in accordance with the instructions given to the architect, Mr. J. Fletcher Trew, M.S.A., of Gloucester. The front block of the buildings facing Barton-street will contain two first-class and four second-class private baths for each sex, with separate entrances, waiting-rooms, and lavatories, also caretaker's rooms, ticket office, &c. These private baths will be supplied with hot and cold water, and will be well lighted from the street and from an open space between the front and main blocks of the building. The main block of the building will comprise two swimming-baths of exactly the same size, each having an internal measurement of 100ft. by 46ft., and an actual water space of 82ft. 6in. by 28ft. 6in., varying in depth from 3ft. to 6ft., and holding 70,000 gallons of water. These baths will be lighted from the roof and gable ends, and well ventilated and warmed. The ponds will be lined with glazed bricks of a cream or ivory tint, and the platform round the ponds will be finished in impervious cement concrete paving. Dressing-boxes will be provided along one side of each bath, and may be added on the other side if required. The roofs, which will be boarded and slated, will be supported on strong iron principals 10ft. apart on brick piers 2ft. by 1ft. 6in., connected together by 14in. walls. The Turkish bath has been carefully planned to fill the rather awkward piece of ground between the swimming-baths and Prince-street, and will contain three hot rooms, with shampooing and cooling rooms, dressing boxes, &c. An additional separate entrance from Barton-street will be provided, and may be used if necessary. The engineering work will include a large steam boiler for warming the buildings and heating the water in the swimming baths, and the water required for the private baths, laundry, &c. Provision is also made for fixing a duplicate boiler, if required, at a future time. The steam laundry will be complete with modern appliances, including steam washing, wringing, and mangling machines, and steam drying closet. A service subway will be provided under the Turkish baths between the laundry and the front block of the building, to facilitate the collection and distribution of towels and other stores, &c. The proposed baths will afford the desired accommodation for all classes of bathers in a complete and convenient form, and the general arrangement and fitting-up of the baths will enable the corporation to work them with a small staff and at a reasonable cost.

"BUILDING NEWS" DESIGNING CLUB: COTTAGE FURNITURE.

THIS drawing illustrates the designs placed second in the last competition for a Gardener's Cottage and its Furniture. A review of the designs submitted, together with illustrations of the chosen ones, will be found in our issue for July 13th, and we shall publish the Cottage plan placed second at an early date. "Boreas" is the motto of the author. The drawings will explain themselves, and we have already remarked upon them in the above named notice.

On Saturday, the ceremony of blessing the foundation stone of the new Catholic Church of St. Benet's, Monkwearmouth, was performed by Dr. Wilkinson, Bishop-Auxiliary of Hexham and Newcastle. The new church will accommodate 1,000 worshippers. The style of architecture will be Early Gothic. Messrs. Dunn, Hanson, and Dunn, of Eldon-square, Newcastle-on-Tyne, are the architects. The contractor is Mr. T. Lumsden, of Jarrow-on-Tyne.

Dissolutions of partnerships are announced in the cases of the following firms of builders:—J. P. Wells and S. B. Chappelow, trading as Prestige and Co., Grosvenor-road, Piccadilly; and F. Harrison and W. H. Hughes, Arthur-street East, London Bridge.

BARONS' HALL, PENSURST, KENT.

THE Barons' Hall, Penshurst Place, was built by Sir John de Pulteney under a license to crenellate from Edward III., between 1341 A.D., when the license was granted, and his death in 1350 A.D. The interior of the hall measures 64ft. by 39ft., and is 64ft. high from floor to ridge of roof. It is covered by an exceedingly massive oak roof with curved ribs, terminated by quaintly carved corbel figures of oak. The floor is still paved with the original square tiles, and one end is raised forming the dais on which was placed the high table. The side tables and benches are stated by Parker to be the oldest English furniture extant, being of the same date as the hall itself. The iron fire-dogs are still to be seen in the middle of the hall, bearing the Leicester crest.

The oak screen at the other end of the hall partitions off the doors leading to the buttery hatch and kitchen, and forms a passage through the hall. The screen also bears the Leicester crest. This hall, here shown by drawings by Mr. J. W. Little, gives a good idea of what the chief room of a feudal baron's house was like in the 14th century. It is now in the possession of Lord de L'Isle, and was restored by the late Mr. Geo. Devey. Views of Penshurst Place were given in the BUILDING NEWS for Sept. 24, 1886, with an account of its history.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

A SPECIAL general meeting of the donors and subscribers was held at the offices, 21, New Bridge-street, E.C., on Tuesday last, July 31st, Mr. E. C. Roe (of Messrs. Geo. Trollope and Sons) in the chair, in the absence of the president.

The secretary having read the advertisement convening the meeting, the minutes of the last general meeting were read, confirming the election of Messrs. J. Howard Colls, Thos. F. Rider, and Wm. Robert Freeman (J. Mowlem and Co.) as trustees of the Institution, in succession to the late Mr. Benjamin Colls (who died some years since) and Messrs. Edward Conder and Arthur Cates, who have recently resigned. Three of the original trustees—viz., Messrs. G. S. Pritchard, Charles Richardson, and W. C. Anderson, who were appointed at the foundation of the Institution in 1866—still retain office, and, together with the three gentlemen recently elected, make up the number of six trustees as required by the rules.

The election of a pensioner—Mrs. Louisa R. Styles—to the widow's pension then took place by show of hands, the amount being £20 per annum. The election of Mrs. Styles makes up a total of seventeen pensioners now on the books of the Institution.

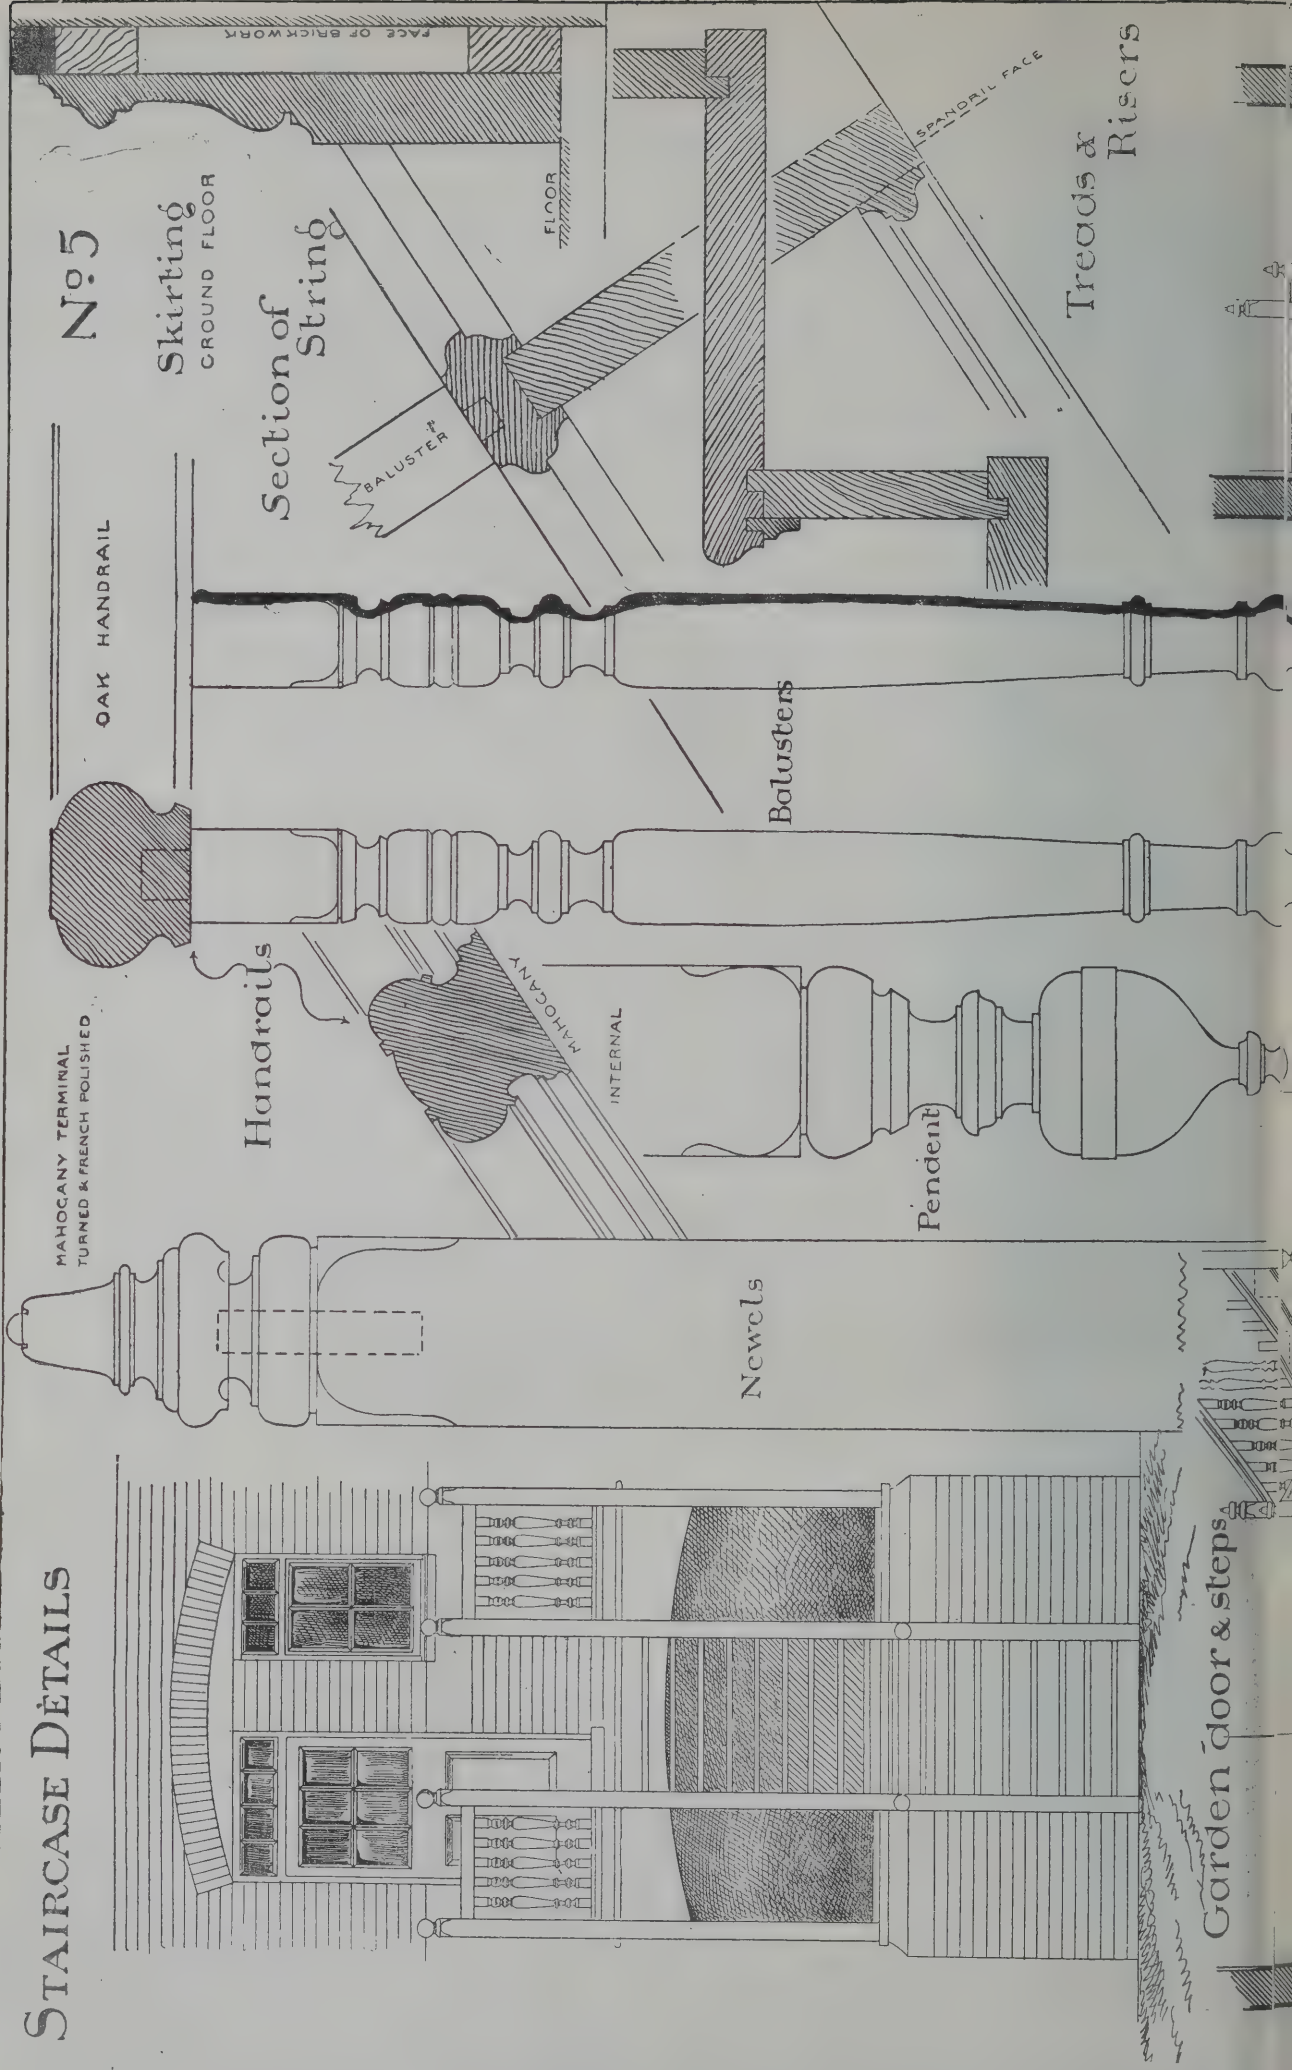

At the conclusion of the business a vote of thanks was presented to the chairman for his kindness in presiding, and the meeting closed.

BOOKS RECEIVED.

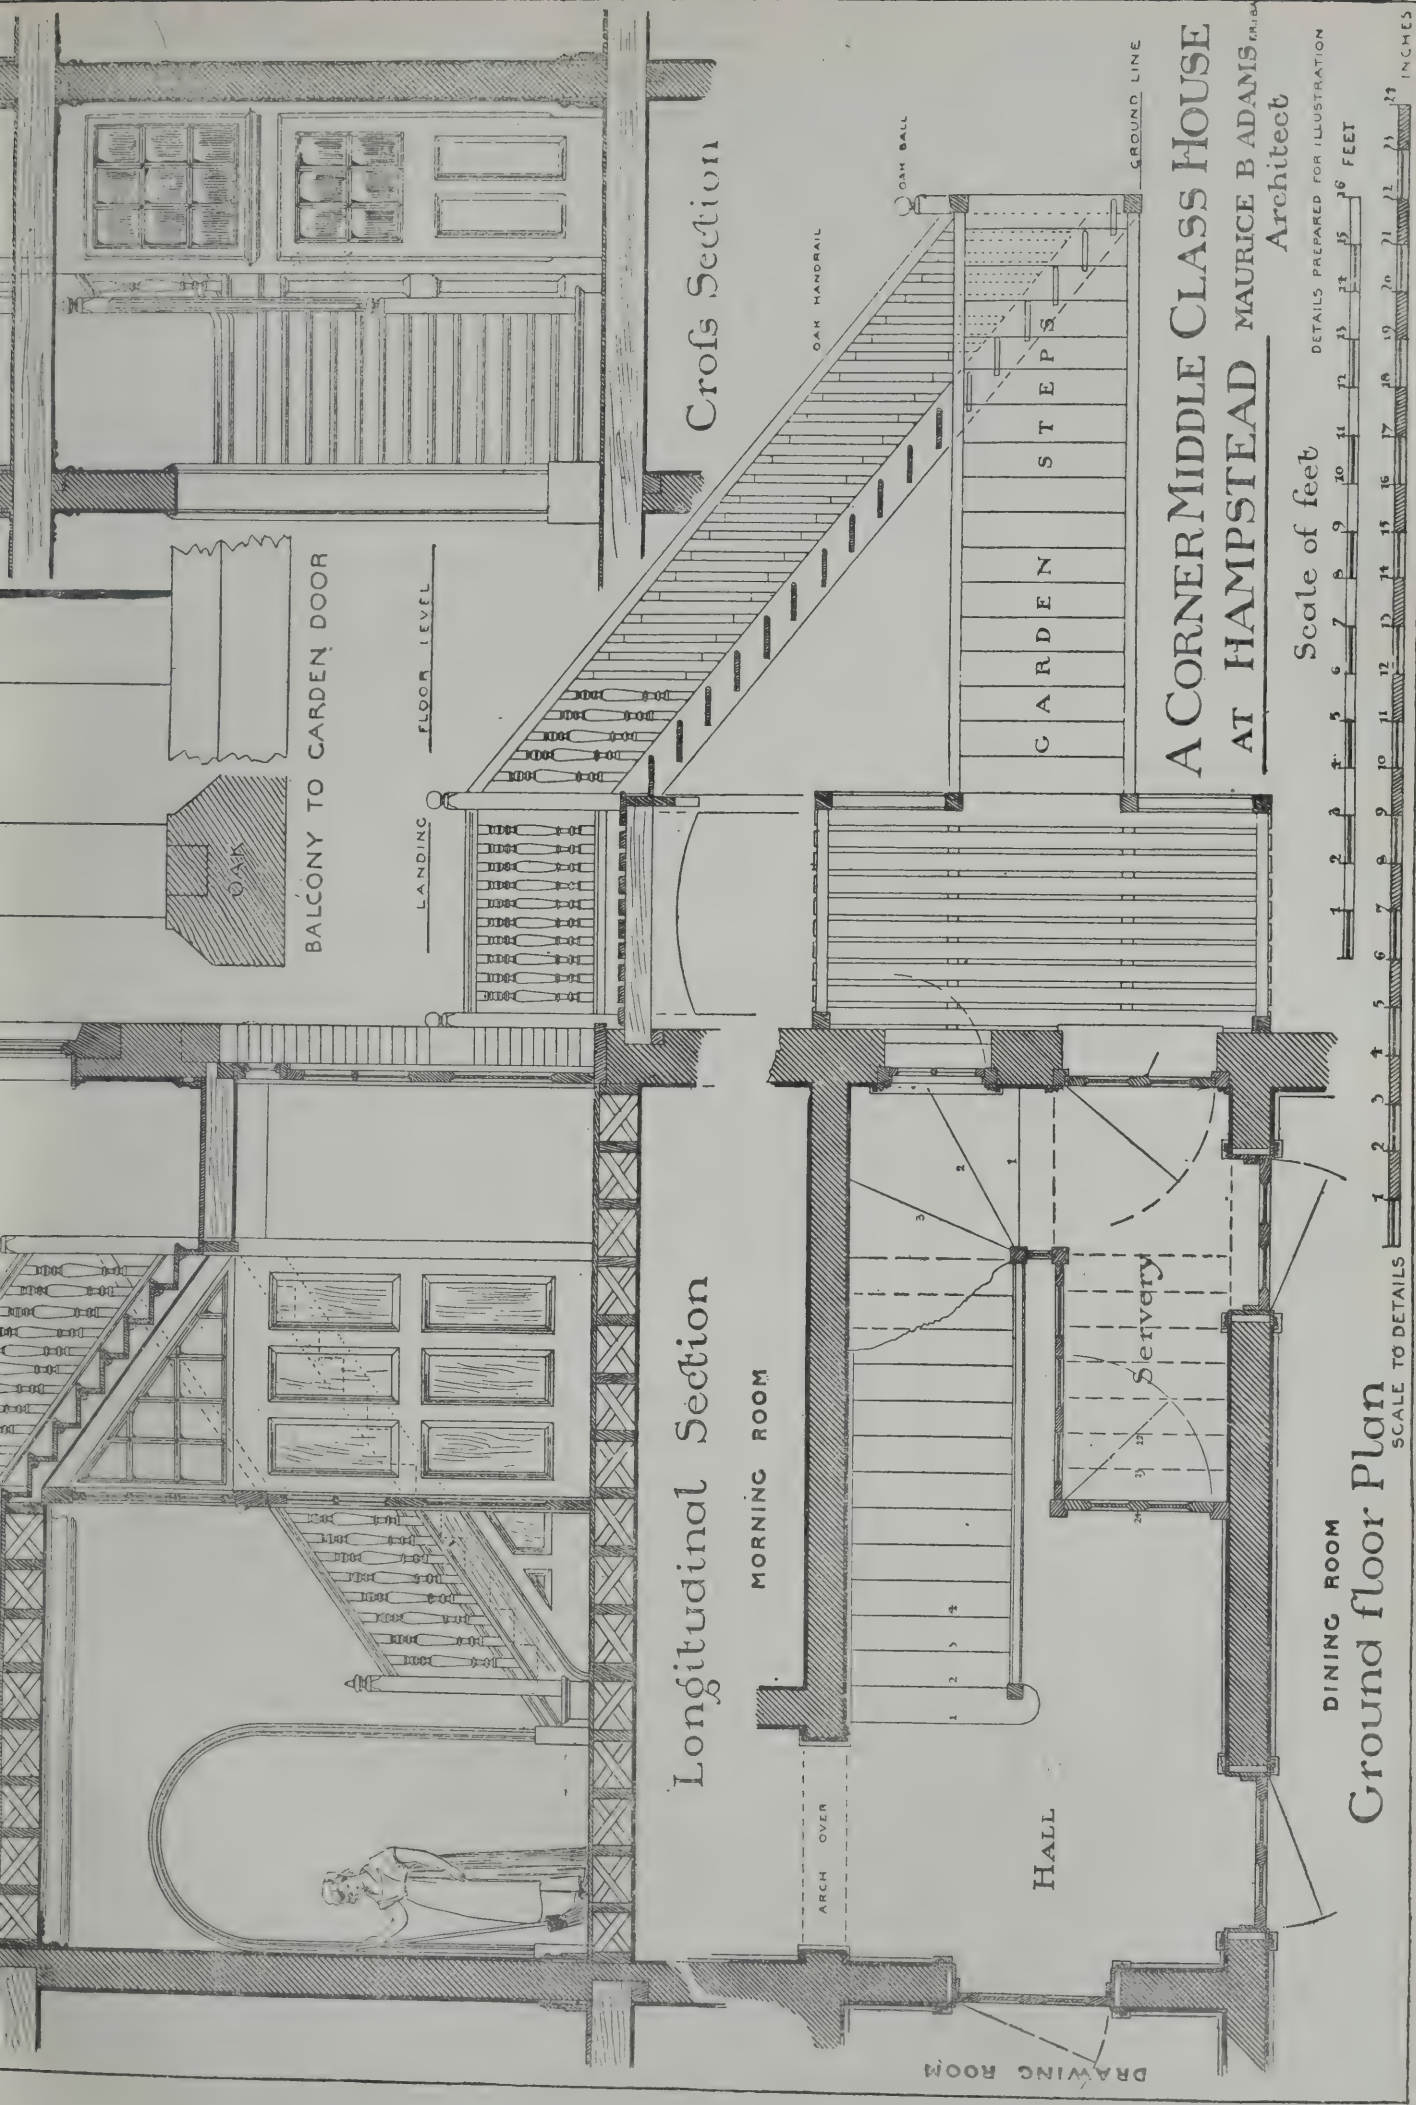

*Gwilt's Encyclopædia of Architecture*. New edition. (London: Longmans, Green, and Co.) Mr. Wyatt Papworth has just revised and published, through Messrs. Longman, a ninth edition of the familiar "Gwilt," indispensable to every architectural student, and an easily recognised feature of every architect's library. The book retains its cumbersome plan of arrangement, and its awkward index by sections instead of pages, but has been considerably amended and revised, the number of pages being increased from 1395, in the last edition published in 1876, to 1443. The most important alteration is the revision and extension of the chapters on "Materials Used in Building" and "Use of Materials," wherein the information as to fireproof construction and sanitary matters is corrected in accordance with present knowledge. The section on "Specifications" has been recomplied, the lives of eminent architects have been brought down to date, as are also the publications, while the glossary of terms has been amended. We can find no allusion to the subject of Graphical Statics, now one of necessity to the student, and the chapter on Pointed Architecture remains as in former editions, inadequately treated. At two and a-half guineas the revised "Gwilt" cannot, however, be accounted dear.

## ANCIENT HINDU ARCHITECTURE.

A PORTFOLIO of studies illustrative of an adaptation of ancient Hindu architecture has just been published by Mr. B. R. Harrington, C.E., of Lonsdale House, Norwich, whose endeavour, the preface tells us, has been "to introduce no foreign elements into his work, but to add only breadth, freedom, and intellectual thought to the indigenous architecture" of Hindustan in the hope that its ancient art may be so revived as to express the thoughts and feelings of the people. The magnificence of this ancient style is undoubted, and its decay and threatened extinction can but be a source of regret to the thoughtful and cultivated Hindu especially. The art has become already a tradition. The Mohammedan style superseded it, and modern European types of design have debased Hindu architecture out of recognition with its old-world grandeur of breadth, colossal power, and majestic massiveness. The Mohammedan conquest at the beginning of the 15th century commenced a rule which for four centuries dominated the art of the country till the developing works of the British engineer and enterprise of successive English Governments with their railways, canals, and other important works, introduced an alien art, on the plea that native designers are incompetent to adapt modern conveniences to their traditional methods, and hence the incongruous combinations of such styles as the Modern French Renaissance with the ancient Hindu. Fergusson lamented the gradual extinction of Hindu art, and the author of these drawings has shown great patience, much enthusiasm, and considerable skill in applying the indigenous style in its strict purity to the modern necessities of civil architecture with lofty apartments and well-ventilated rooms, spacious halls, and convenient buildings. The absence of plans in this portfolio prevents one from following the author's scheme in detail; but we have designs for a palace, the bath, the ghaat, some stables, a city gate, a municipal building, city chambers, and street architecture, all studied from the ancient Hindu style, which Mr. Harrington is earnestly labouring to revive in India.

## AIR ANALYSIS IN PUBLIC BUILDINGS.

A CHEMICAL and bacteriological report on the air of 26 public buildings in Newcastle-on-Tyne and Gateshead has been prepared for the North-Eastern Sanitary Inspection Association, Newcastle-on-Tyne, by Dr. P. Phillips Bedson, Prof. of Chemistry, Durham College of Science; Mr. Thomas Watson Lovibond, F.I.C.; and Mr. Walter D. Severn, Assoc. Norm. School of Science. The examinations were held in lecture rooms and places of amusement, churches and chapels, grammar, high, and board schools, hospitals, courts of justice, and dressmakers' workshops. The greatest increase of carbonic acid in the series of experiments was at St. James's Hall, after a concert, when in two hours the amount of carbon dioxide rose to 31 above the standard, 6 per 10,000 parts, which was taken as an obtainable condition of healthy air in inhabited places. The town hall, under similar conditions of use, shows also a much deteriorated atmosphere. The writers give the proportion of organisms found in the air examined, but point out that more importance should be attached to high carbonic acid than to numerous organisms. The amount of carbonic acid present, being the indicator and proportionate consequence of fouling either by respiration or combustion, may be taken as a fair criterion of the amount of contamination which has taken place. The number of organisms in the air is, however, largely affected by other influences than the fouling rate. The most important of these is the amount of mechanical agitation taking place. The investigations in hospital wards show a low amount of carbonic acid, but a high rate of bacteria, and it is curious to note that the ward giving the largest amount of carbonic acid, 12.2 per 10,000, is the only one examined in which recent ventilating appliances are employed. The ward is warmed by closed stoves; Boyle's ventilators and Tobin's tubes are used, but no mechanical aid is used to circulate the air. The bacteria in this ward are also the highest. Taking carbon dioxide as an indication of vitiation, churches appear to be quite as badly ventilated as an average

public hall, and much worse than the theatres. In schools the results vary very much, but there is a tolerably constant relation between the condition of the air and the class of school in favour of middle-class schools.

In conclusion, the examiners say: The total result of our examination of the air of public buildings in Newcastle-on-Tyne appears to show the almost universal need for some improved system of ventilation. In very crowded rooms occupied for hours at a time, like courts of justice, some mechanical means of removing foul air and supplying fresh seems imperative. The Assize Courts illustrate the advantages of such a system, for at 3.30 p.m. on a crowded day the carbonic acid was only 6.66. In churches, assembly rooms, and places occupied for a comparatively short time, good results might be obtained by capacious ventilating shafts well heated; but the advantages of a good mechanical system of ventilation are so great that it had better be employed. In schools of the better kind, where class-rooms and classes are comparatively small, the natural ventilation obtained by doors, fire-places, and windows, aided by Tobin's tubes and Boyle's valves, might suffice. In schools, where large numbers of children congregated, more efficient means become necessary, particularly if the children be dirty and ill-clad. In all cases it must be remembered that any system of ventilation to be of service must be used. Tobin's tubes are useless when closed. Ventilating shafts are not much use—indeed, sometimes act the wrong way if the heat at the bottom is not kept up. One essential in all systems of ventilation is the proper warming of the fresh air. If this is not done, the first cold day in winter is the signal for closing all ventilating apparatus for the season, if not for good.

## A NEW HANDBOOK OF DRAWING AND DESIGNING.

"ROUND as the O of Giotto" is an old saying, and it came about thus:—The great Tuscan art revolutionist is recorded on one occasion, when making an afternoon call, to have described a free-hand circle on the door-post instead of leaving a card, as a more proper person would have done. The absent friend, on returning, at once recognised the hand of the master, for, said he, "only a very great artist could have done this." Hence the saying above quoted, which supplies Mr. Charles G. Leland with the text for his treatise on "Drawing and Designing," just published by Messrs. Whittaker and Co. "Anyone," he adds, "who can draw an O or a spiral can draw anything"; and again, "Any person who is capable of learning to write may also by this system learn not only to draw, but also to design or to invent original outline decorative designs." In fact, thus easy is the course by which every lesson becomes so simple that it forms a gradual advance from the one preceding; and all that remains necessary is that each one, as it comes, shall be perfectly mastered and practised. Such are the terms of the preamble; but we can only confess to considerable disappointment at the result if judgment be formed from the specimens of design with which the teacher has illustrated his volume. More particularly is the paucity of originality in these designs apparent where the circle has been allowed full sway; indeed, to use the writer's own limitation, they look as if they really could "all be laid out or planned in the first place with a pair of compasses, or even with coins of different sizes." If the pupil finds the task difficult, let him practise with circles, triangles, and squares. He who can draw the volute or spiral can draw anything, and any child can do it who will try. Mr. Leland further informs us that his system "forms the alphabet of all the minor arts, such as modelling, embroidery, woodcarving, leather-work, inlaying, ornamental and practical working in wood, metals, &c., since anyone who can design simple patterns may with perfect confidence attempt any of them." "It has been successfully taught by the author to nearly two thousand pupils." "Give and take patterns," "tangential circle stems or touching curves," and "up and down and across" patterns are all very well; but mere patchwork, though kaleidoscopic, does not necessarily constitute even the basis of good decorative design,

and we are unable to follow Mr. Leland through all the "horizontal vertical squares," and diagonal intricateness of forms which seem to constitute so large a part of his "simplified" system. He gives several good, useful pieces of advice, no doubt, about the mere mechanical portion of his subject; but, like many another originator of new systems, he forgets that the best and most practical details included in his scheme are also common property, and can neither claim originality nor exclusive freshness of idea. Thus, in conclusion, he writes:—"If the pupil be first trained in circular outline, decorative design, and then in object drawing, more advanced geometry, and perspective, he will be far more skilled in a given time than if he had been put at all these together in the beginning. The writer says this from years of experience and earnest experiment." Every school of art teacher adopts exactly the same method, and we fail to see where the exact "system" comes in.

## PROPOSED ART CONGRESS IN LIVERPOOL.

A MEETING of the general committee having charge of the arrangements for the holding in Liverpool of the first Congress of the National Association for the Advancement of Art and its Application to Industry, was held on Monday in that city, Mr. P. H. Rathbone presiding. Mr. H. E. Rensberg, hon. sec., reported that the arrangements for the congress, which will be held at the end of November or the beginning of December, had been fixed as follows:—Monday: Opening address by the president of the congress, Sir Frederic Leighton, Bart., P.R.A. Tuesday: Morning, address by the president of the section of architecture, Professor George Aitchison, A.R.A.; afternoon, address by the president of the section of painting, Mr. L. Alma Tadema, R.A. Wednesday: Morning, address by the president of the section of applied art, Mr. Walter Crane; afternoon, address by the president of the section of sculpture, Mr. Alfred Gilbert, A.R.A., and combined meeting of the sections of art history and national and municipal encouragement of art. Thursday: Morning, address by the president of the section of art history and museums, Mr. Sidney Colvin; afternoon, combined meeting of the sections of architecture, painting, and applied art; afternoon, address by the president of the section of national and municipal encouragement of art, the Right Hon. A. J. Mundella, M.P. The ordinary meetings of the sections will follow the addresses and combined meetings. Mr. G. W. Moss had been appointed a vice-chairman of the executive committee, and Mr. F. J. Leslie an additional honorary secretary. The committee, after careful consideration, were of opinion that a sum of £1,000 was required for the purpose of the congress, and they proposed to raise it by the annual subscriptions of members of the association, by the contribution of associates, and by a donation fund.

The report having been adopted, the following gentlemen were appointed local hon. secretaries of the various sections:—Painting, W. Wardlaw Laing; sculpture, Charles Sharp; architecture, C. W. Blease; applied art, H. B. Bare; art, history, and museums, Chas. Dyal; national and municipal encouragement of art, P. H. Rathbone.

On Saturday, the Rev. Canon Toole laid the memorial-stone of a day industrial school in connection with the Manchester School Board. The school, which is being erected in Mill-street, Ancoats, will have accommodation for 400 scholars. The ground floor comprises the office and waiting-room, the dining-hall, with store-room, kitchen, plunge-baths, and lavatories. The schoolrooms and classrooms are on the first floor. The cost of the building will be £6,500. The architect is Mr. J. Lowe, of Manchester, and the builders Messrs. Robert Neill and Sons, of Strangeways, in the same city.

The completion of the Jubilee Clock-tower at Newport, Isle of Wight, has been celebrated by a dinner given to the contractor's men. The tower has been carried out from plans by Mr. R. Braxton Peers, and is in harmony with the adjoining town-hall, which was designed by Nash. The builder was Mr. T. Jenkins.

FOURTEENTH LESSON.

## THE RETURN ANGLE OF A CLOISTER.

WE now consider two vaulted passages, which (Fig. 81) form a return angle such as occurs at the angle of a cloister. One of the passages is narrower than the other, and is of semicircular section,  $A'Z'B'$ ; the square section of the other passage is the ellipse  $A''Z''B''$ , the axis  $O''Z''$  of which is equal to radius  $O'Z'$  of the first vault. The groin formed by the intersection of the vaults lies in a vertical plane, and it is projected in plan on the line  $CE$ . We draw the section of the first vault as any ordinary arch. We remind the reader that the radius of the extrados = thickness of the vault at the crown +  $\frac{1}{2}$  of the diameter  $A'B'$  of the arch. The bed-joints of that vault pass through the centre line of the vault. On the wider vault of elliptical section the joint lines will be at the same level as on the smaller vault; this determines  $M''$ ,  $N''$ , &c., on the square section. The surface of the joint will be a plane normal to the soffit of the vault, that is perpendicular to the plane tangent to the soffit along the joint-line. The joints  $M'Q'$ ,  $N'P'$  will be perpendicular to the tangent to the ellipse in the points  $M''$  and  $N''$ . These tangents can easily be found by means of the tangents in  $M'$  and  $N'$  of the semi-circular vault; for as the intersection of the vaults lies in a plane, the tangents to that intersection must lie in that plane. On the other hand, we know that a tangent to the intersection of two surfaces is the intersection of the planes tangent to those surfaces. The line  $T'T$  is the trace of the plane tangent to the first vault along the joint-line  $M'M$ .  $T$  is therefore the trace of the tangent to the groin in the point  $M$ . The trace of the plane tangent to the second vault along the joint-line  $M''M''$  naturally passes through the point  $T$ , the trace is therefore the line  $T'T'$ . Joining  $T'$  and  $M''$ , we get the tangent  $T'M''$ , to which  $M''Q''$  has to be at right angles. When two ellipses have an equal axis, as is the case here,  $O'Z' = O''Z''$ , the tangents, to point at the same level, cut that axis at the same level. For the tangent to the point  $N''$  we need only take  $S'Z' = S''Z''$  and join  $N'S''$ .

Now, the bed-joints of the second vault will be planes drawn through the joint lines, such as  $M''M''$ , and the normals, such as  $M''Q''$ . As the stones which form the groin have to take in a piece of each vault, it is desirable that the joint lines of the extrados should be on the same level in each vault. This determines the points  $Q''$ ,  $P''$ , &c., which form the outline of the extrados of the second vault. Now, the two joint lines on the extrados at the level of  $Q''$  and  $Q'$  meet on plan in the point  $Q$ , and, therefore,  $MQ$  is the projection of the intersection of the bed joints of both vaults at that level. If the points  $QPOpq$  be connected by a continuous curve, it will be the projection of the intersection of the two extrados surfaces.

The extrados of the second vault might be calculated so that its intersection with the extrados of the first vault be a curve in a vertical plane projected in  $CE$ . To do this the generator  $Q'$  of the extrados of the first vault would have to be stopped in the point  $R$  on the line  $CE$ , then through this point we produce the horizontal line  $RR'$ , which will be a generator of the extrados of the elliptical arch; its elevation  $R'$  is a point of the section of the extrados, which in this case will be an ellipse shown by dotted line. The joint  $M'Q'$  would have, in that case, to be prolonged to  $I'$ . Take  $I'$  on joint  $M'Q'$  of first vault at the same level as  $I''$ , and we shall find  $I$  the point on the plan where the bed joint of the first vault meets joint line on the extrados of the second vault. We see thereby that the joint line on the extrados of the first vault will have to ascend the extrados of the second vault from the point  $R$  to  $I$ , so as to get to the joint line of the second extrados.  $RI$  is a portion of the ellipse produced by the section of the elliptical extrados by the plane of the bed joint  $M'Q'$ . On this extrados the joint line of the stone would, therefore, form the broken line  $WIRL$ . This second mode of delineating the extrados is, therefore, rather more complicated than our former arrange-

ment, but it presents the advantage of thickening the larger vault in its lower part, and should always be adopted when there is a great difference in the span of the two vaults.

To continue our first construction, we draw the vertical joints, which are simply vertical planes, projected in  $LGHK$  and  $YVX$ . The polygon  $LQYXNH$  will then be the plan of one of the groin stones.

Now, if we consider a stone on the opposite side of the groin, such as the one of plan  $lgzanb$ , we shall observe that the intersection of the vaults forms a valley, as in the mitre of coved ceilings; whereas on the stone  $LQYXHL$  the intersection forms a projecting groin, as in the case of cross vaults. The angle of a cloister offers, therefore, a combination of both cases of intersection of vaults.

**Moulds.**—By unrolling the soffit of the first vault we get (Fig. 82) the mould for the soffit of that half of the groin stone. The joint line  $G\beta H$  (Fig. 81) becomes the straight line  $G_2\beta_2 H_2$  (Fig. 82), and the groin  $M$  and  $N$  (Fig. 81) develops into the curve  $M_2a_2N_2$  (Fig. 82). Then, making  $G_2L_2 = M'Q'$  and  $H_2K_2 = N'P'$ , we can draw easily the quadrilaterals  $G_2L_2Q_2M_2$  and  $H_2K_2P_2N_2$ , which are the moulds of the bed joints of that half of the stone. Similar moulds might be drawn for that part of the stone which belongs to the elliptical vault; but they are not required for working the stone.

As to the stone  $anlhgz$  on the opposite side of the groin, its moulds are given in Fig. 83, and the reader will observe that their outline coincides exactly with that of the first stone, but reversed, the concave lines of the first becoming convex in the second.

**Cutting of the Stone with the Help of the Square Only.**—Begin by working an operation prism (Fig. 84), the base  $X'Y'q'L'H'$  of which is equal to the outline  $XYQLHN$  of the stone on the plan (Fig. 81), and the height of which is equal to the difference of level between  $M'$  and  $P'$  on the section of the first vault. Then, on the one end the outline  $M'N'P'Q'$  of the head of the groin stone will be delineated. (In Fig. 84 the groin stone is turned upside down, with its further end towards us, so as to show its soffit.) On the other end the head  $M''N''P''Q''$  of the stone will be delineated. Then all the horizontal arrises  $M'M$ ,  $M''M''$ ,  $Q'Q'$ ,  $Q''Q''$ ,  $P'P'$ ,  $P''P''$ ,  $N'N'$ ,  $N''N''$ , will be delineated on the faces of the operation prism.

Guided by these lines, the soffit, starting from the head curve  $M'N'$ , can be worked either by means of a templet cut to the curve of the arch, and made to rest on the lines  $M'M$  and  $N'N'$ , or by repeating the head curve  $M'N'$  on the opposite face of the prism and working the stone with a straight-edge. Then the mould  $G_2M_2N_2H_2$  (Fig. 82) of the soffit of the semicircular vault will be squeezed in, and the groin line  $MN$  (Fig. 84) will be delineated. It is evident that the soffit of the second vault can now be cut with the help of a straight-edge guided by the head curve  $M'N'$  and the groin curve  $MN$ . In drawing the soffit mould, several points, such as  $a$ , should be marked to guide the straight-edge.

The upper bed  $N'P'P'$  is, in Fig. 84, placed below on account of the stone being turned upside-down. It is a plane easy to work by means of the arrises already delineated. The bed mould can then be placed on that plane, and its extremity  $NP$  marked, which gives us all the lines required for working the return of the bed in  $N'P'$ . As for the lower beds,  $M'MQ'Q'$  and  $M''M''Q''Q''$ , they comprise a valley. The first bed will have to be worked progressively from the edges  $M'M$  and  $Q'Q'$  until the bed mould can be placed thereon, taking care to keep the line  $MQ$  quite clear; then the other bed will be easily worked.

The extrados surfaces can be worked with the help of a templet and an extrados mould; but often the back of the stone is not worked at all, and the groin stone is simply finished by the horizontal plane of the operation prism.

The above method of working the groin stone is very accurate; but as it implies a waste of labour in working many operation planes, master masons prefer the next method, where the work is done with the help of bevells.

**Method of Working the Stone with Bevells.**—In this method the soffits of the stone are first replaced by two operation planes which connect the arrises  $MG$  and  $NH$ ,  $MV$  and  $NX$

(Fig. 81). If these planes be prolonged, the one would have the vertical trace  $M'N'$ , the other  $M''N''$  on the planes of the cross sections. The intersection of these two soffit planes is a straight line projected in plan on  $MN$ ; this line is the chord of the ellipse profile of the groin. To get the bevel required for working this stone, the solid angle comprised between the two operation planes must be measured. To do this we turn down the groin round the line  $CE$  (that is exactly equivalent to making an elevation of the groin, taking the line  $CE$  as ground-line), and we get the chord  $\mu'\nu'$ , and the horizontal joint lines projected on horizontal lines as  $\nu'\delta'$ . Now, if we take through a point  $\phi$  on the chord a plane at right angles with the chord, it will cut the joint lines in points projected on the groin elevation in  $D$ , and on plan in  $D$  and  $\delta$ . The lines connecting the point  $\phi$  with the points  $D$  and  $\delta$  measure the solid angle comprised between the soffit operation planes. When we turn up the plane with which we cut the solid angle, the point  $\phi$  comes to  $\phi'$ . That plane is then horizontal, and we get the solid angle in its real size in  $D\phi_2\delta$ . In this operation the line which connects the points  $D\delta$  is the hinge round which the plane is made to turn.

Now, having chosen a block of stone dotted on elevation, we work one of its sides to a plane, and mark thereon the outline of the soffit operation plane containing  $MM'$ ,  $NN'$  (Fig. 85), a quadrilateral easily drawn. Then, guided by the line  $MN$ , the operation plane of the soffit of the other vault will be produced. To work it, a bevel (Fig. 85) giving the solid angle between the operation planes is used. The length of the lines  $NN''$ ,  $MM''$  being measured off from the plan, the end joint  $M'N'P'Q'$  is worked square to the soffit operation plane, and the same is done for the other end joint  $M''N''P''Q''$ ; then the section of the vaults are placed on the respective head-joints, and the beds and soffits can be worked as described before. In this method, the only labour wasted on operation planes is that for the soffits, all other worked surfaces remain.

The groin stones on the valley side, such as  $anlhgz$  can be easily worked by the first method, but some care will be requisite to stop the soffits neatly at the groin line.

**The Key-Stone of the return angle (Fig. 81)** is worked like the other groin stones. In the key-stone of a crossing (Fig. 76) the soffit belonging to the semicircular arch is first worked right through its length. Then with a templet giving the elliptical profile of the groin, the two groin lines can be marked, and the soffit of the other vault can be worked therefrom. The key-stone of a rectangular dome is rather difficult to work on account of its soffit presenting four valleys. With templets giving the profile of the groins, chisel-chases must be worked down on the diagonals of the key-stone. These will then serve as guiding lines for working the cylindrical surface of the soffit between them. The most practical way of sinking curved chisel-chases is to sink several holes along the line of the depth requisite to reach the curve, then connect these holes together by removing the stone between them.

(To be continued.)

On Saturday the foundation-stone of a new school and parish rooms, to be erected in connection with Burley Church, Leeds, was laid by Mr. W. L. Jackson, M.P. The building, the plans for which were prepared by Messrs. Smith and Tweedale, of Leeds, will be faced with Horsforth stone and lined with 15in. brickwork. The school-room will be 63ft. by 33ft. 6in., and there will also be three classrooms, each 23ft. by 19ft. One of these classrooms, situated at one end of the large schoolroom, will be raised 2ft. 6in. above the general floor level, and will serve as a platform in the case of the schoolroom being used for public meetings, the two rooms being divided by revolving shutters when not so used. The total cost of the building and land will be about £3,000. The whole of the works have been let to Mr. Thomas Hannam, builder, Woodhouse, Leeds.

New Congregational schools and a lecture-hall are about to be built on the Vine Court Estate at Sevenoaks. The builder is Mr. W. Wiltshire, of that town, whose tender has been accepted at £1,555.

The Hon. John Collier has been selected to paint a presentation portrait of the present Lord Mayor.

## Building Intelligence.

**BANGOR, BELFAST.**—A new Presbyterian church was opened at Bangor on Sunday last. It is built of Yorkshire stone throughout, with cutstone dressings from the Glebe Quarries, County Down, in the Early Perpendicular style. The building consists of nave, with double arcaded transept on either side, lofty arched choir platform, vestry, cloak-rooms, &c. From 600 to 700 people will be seated in the church. The upper stages of the tower are incomplete for the present. Its ground story forms one of the two porches. Internally the woodwork fittings generally are of pitch pine, having open bench seats for the congregation and choir stalls on platform, on one side of which is placed a oak carved pulpit. The roof is arranged in panels for future decoration. Each window has an illuminated design introduced into the central panel of the leadwork. Amongst the subjects selected are the burning bush and the dove; others have fruit and flowers. The glass is the work of the London and Glasgow Stained Glass Company. The general contractors were Messrs. H. Laverly and Son. Mr. Close, Belfast, is the architect.

**LONDON.**—The Suffragan Bishop of Marlborough consecrated the new Church of St. Philip in Buckingham Palace-road, on Thursday. The building consists of nave and chancel 120ft. long by 27ft. wide, and north and south aisles 13ft. wide; north and south transepts, morning chapel, and large vestries, with organ-chamber over. The accommodation is by chairs for 850 people, and the total cost will be about £8,000. The walls are faced outside with Gainsborough pressed-bricks, inside they are plastered, and have Bath-stone dressings; the core of the walls is cement concrete, bonded with hoop iron. The roofs are of pitch-pine covered with tiles, and the flèche, which rises to a height of 100ft., is covered with copper, by Messrs. Ewart and Son, of 346, Euston-road, N.W. The floors are laid with patent wood-block flooring. The heating is Grundy's hot-air system. Messrs. Macey and Sons, of the Strand, were the general contractors. Messrs. Demaine and Brierley, of York, are the architects, and Mr. T. W. Creed, the clerk of works.

### COMPETITIONS.

**CLAPHAM PUBLIC LIBRARY.**—In this competition the commissioners, acting on the report of the assessors, Messrs. Neighbour and Allcroft, have adopted the design under motto "Light," by Mr. E. Blakeway l'Anson, 7A, Lawrence Pountney-hill, E.C., and voted an "honorarium" of ten guineas to the author of the alternative designs, "Spes A." and "Spes B." Mr. John J. Jones, of Lydon-road, Clapham. Mr. Jones has since returned the cheque to the commissioners on the ground that, as the assessors reported that "Light" would exceed the stipulated outlay (£3,500) by £400, and that his designs were the only ones that came within the limit of cost, the sum of ten guineas was a "totally inadequate remuneration" for his services. The secretary to the commissioners replied, declining to enter into a controversy, and asking if he should return the cheque. In response, Mr. Jones expressed his surprise that such a question should be asked, and again emphatically declined to receive such an "honorarium." We reviewed the six designs submitted in our issue of the 8th June, p. 795, last vol.

**ROTHESAY.**—The Kirk-Session of the parish having offered three premiums for designs for the new church they propose erecting at Craigmare, the committee selected three designs, which were sent to a referee, who has given his award to the design marked "Clyde," Mr. D. A. Crombie, St. Andrew-square, Edinburgh, who has therefore been appointed architect. Mr. J. Bennie Wilson, Glasgow, and Mr. W. F. Gibbon, Glasgow, were awarded second and third premiums. The selected design is Gothic in style, with a tower rising 80ft. high. Accommodation will be provided for 633 sittings, and the cost is expected to be £3,433.

The annual meeting of the Kent Archæological Society was held at Hythe and its vicinity on Wednesday and Thursday.

## Engineering Notes.

**PRESTON.**—THE RIBBLE SCHEME.—The Corporation of Preston have come to an arrangement with Mr. T. W. Walker, the contractor of the Preston dock works, for the suspension of operations for twelve months, in accordance with the recommendations of the Select Committee of the House of Commons. The agreement for the suspension specifies that the men should cease work on the 28th (last Saturday); that there shall be paid about £34,500 to Mr. Walker as retention money; that there shall also be paid £5,000 for the maintenance of the works by pumping and by protecting the stonework from the effects of frost. Mr. Walker will not be responsible for the silting up of the new diversion. The new quay on the face of the diversion will be used as early as possible for the coasting traffic there is at present. The old quay is gradually silting up. As to the sewage scheme, by which the sewage of Preston is to be pumped up to the Freckleton farm of the Corporation, an application will at once be made to the Local Government Board for borrowing powers. This will cost about £100,000.

### ARCHÆOLOGICAL.

**KIRKSTALL ABBEY.**—The portion of the ruins of Kirkstall Abbey which the visitor sees near the entrance gate, to the right hand, is supposed to have been the corn mill, a supposition lately confirmed by the discovery of the conduit which led the water from the mill to the river. Where the Cistercian monks obtained the water to turn the mill does not appear at present; but last year the custodian of the ruins unearthed the waste water conduit to the north-west of the main building, taking two directions, one towards the river, and the other towards the bottom of the cloisters. The large blocks of stone which held the sluice doors by which the water could be turned in either direction, with the grooves in which the doors fitted, are there in position just as perfect as on the day they were laid. The supposition is that, when required, the water was turned in the direction of the Abbey for sanitary purposes, thus washing away the refuse into the adjoining river.

### CHIPS.

A public inquiry was recently held at Bishop's Stortford by Major-General C. Phipps Carey, one of the inspectors of the Local Government Board, into an application made by the local board to borrow a sum of £1,000 for the erection of new stabling, &c., for the board's horses. Mr. R. S. Scott, the surveyor to the board, attended, and explained the plans which he had prepared.

On Saturday afternoon the Marquis of Hertford laid the foundation stone of a new wing which is to be added to the Orthopaedic and Spinal Hospital, Newhall-street, Birmingham. The alterations and additions to be carried out will result in an expenditure of £800. Messrs. Sappcote, of Camden-street, Birmingham, are the builders.

Mr. F. Madex Brown has made considerable progress with the picture intended to be the tenth of those decorating the Town Hall of Manchester. The design represents John Kay, inventor of the fly shuttle, escaping from the fury of the mob when they broke into his house at Bury, Lancashire.

The members of the Hampshire Field Club held a meeting at Ventnor and Bonchurch on Wednesday week, when papers were read by Messrs. Norman, Colenutt, and T. W. Shore.

Mr. E. H. Shorland, of Manchester and London, has recently supplied his patent Manchester warm-air stoves to warm the day-rooms of Ballinasloe Lunatic Asylum, Mr. J. F. Kempster being the architect.

The Dowager Empress Victoria has singled out the Church of the Holy Sepulchre at Innichen, in the Tyrol, as the model of the mausoleum to be built over the tomb of the late Emperor Frederick. At the wish of the Empress, Baron Friedrich von Schmidt, the well-known Vienna architect, is making plans of the church.

Mr. Hutchinson, R.S.A., has just finished in the clay a portrait bust of the Queen for the Victoria Art Gallery, Dundee. Mr. Hutchinson has also been commissioned to execute a bust of the late Prince Consort for the same gallery.

### TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

### TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (via Brindist), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

### ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

### SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

### NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLII., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., LI., LII., and LIII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—O. C. and Co.—F. I. G.—W. H. H.—W. G. and Son.—J. G.—J. W. and R.—W. E. R. and Co.—W. P.—W. I. and Son.—C. B.—C. N. and Co.—J. C. B.—W. W. and Son.

J. R. (We shall only be too pleased to publish in full any good design sent us, with detailed drawings, estimates, &c., just as we are doing with those Mr. Lovegrove has already given.)

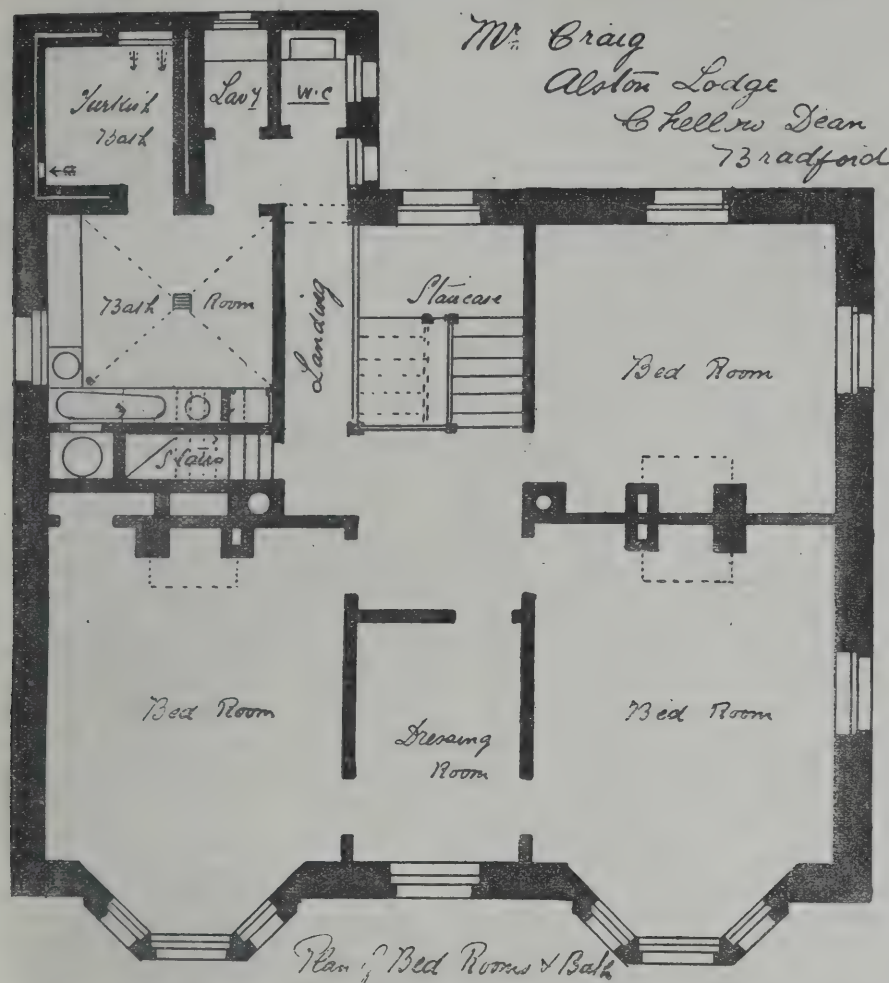

## Correspondence.

### REGISTRATION AND DISHONEST ARCHITECTS.

To the Editor of the BUILDING NEWS.

SIR,—I am glad to see, according to your report last week, the Society of Architects has passed a rule giving the Council power to deal with members proved guilty of unprofessional conduct. Not—to its credit be it spoken—that the Society needs it so far. Its only member concerned in the recent shameful revelations at the Board of Works—Mr. Walter Emden—appeared in a most creditable and very different capacity from that of some other architects implicated. I wonder if the Council of the Royal Institute of British Architects is busy framing a new rule for the benefit of some of its own members, whose irregularities have reflected such lustre on the body to which they belong, that it is so long taking action? When the Registration Bill comes before Parliament next, Mr. Emden and its other promoters may not unreasonably point out what, of course, we all knew long ago—that no professional body has ever yet had either the inclination or power to deal with such scandals as are now revealed, and that only a General Council of Architecture can be trusted to root out the black sheep of the profession. The black sheep know this well enough—hence their hearty and very natural opposition to registration.—I am, &c.,  
A REGISTRATIONIST.

## STRAINS.

SIR,—The two communications on "Strains" which have appeared in your columns have contained serious errors.

In the last half of the second communication Mr. Middleton professes to expound a new theory of shearing stress, which he naively remarks has apparently been overlooked by other teachers.

He attempts to prove that the shear at the centre of a uniformly loaded beam is  $\frac{W}{4}$ , and not  $nil$ , by calmly altering the conditions to that of a beam loaded at two points. Why he should not have selected the simpler case of a beam with one load at the centre to base his argument on is not clear, except that it might have led him into a difficulty unsolvable by his new theory. Unfortunately, the conditions selected to replace the actual conditions do not support his new theory, the shearing stress between two equal loads equidistant from the centre being  $nil$  and not  $\frac{W}{4}$ .

Mr. Middleton's scissors simile would have been a very good one had he properly applied it. Each blade of the scissors represents the vertical resultant of all the forces acting on its side of the section under consideration.—I am, &c.,

July 31.

H. C. SEDDON.

## PRIVATE TURKISH BATHS.

SIR,—In the able articles which have appeared from time to time in the BUILDING NEWS on the Turkish Bath the writer has confined himself chiefly to description of construction and ornamenting of large public baths. The Turkish bath has taken deep root in this country, and is a valuable institution. It is extensively used by all classes of the community—by peers and artisans—for sanitary as well as for remedial purposes. Every town of any pretension must now have its Turkish bath; many large towns have several, and the large, first-class hotels now find it necessary to have a Turkish bath annexed to their estab-

lishment, contributing so materially as it does to their success.

Private Turkish baths are greatly on the increase. Formerly, on account of the great expense of construction, a luxury like the Turkish bath could only be indulged in by the wealthy; but now a neat and efficient bath can be put up at a very moderate cost, and there is no difficulty whatever in heating such a bath with the same heating apparatus which warms the house. The hot air can be readily directed to the bath or to the house, as it may be required.

When a new house is in course of erection the hot-room may be arranged so as to adjoin the ordinary bath-room on the same floor as the bed-rooms. On reference to the subjoined plan the economy of such an arrangement must at once be clear to everyone.

In warming a house already erected we frequently make a small hot-room in the basement alongside the brickwork inclosing the heating apparatus. This room is invaluable to a family, as the valves can be closed, and the heat can be shut off from the rooms above and turned into this room. The necessary high temperature also can be raised in a short time to produce a copious perspiration. By this means a severe cold or chill may be conveniently and readily thrown off, and perhaps a serious illness avoided.—We are, &c.,

J. CONSTANTINE AND SON,  
Convolved Stove Works, 23, Oxford-street,  
Manchester.

## ST. MARY'S CHURCH, BRIDGEWATER.

SIR,—In your issue of the 20th inst., I observe that you have stated that the name of architect for the restoration or the above church is Mr. Gedding. Allow me to say that it is—Yours, &c.,

JOHN D. SEDDING.

447, Oxford-street, W., July 26.

## SOLICITORS' LIBRARY AT EDINBURGH.

SIR,—In your issue of the 20th, among "Notes from Edinburgh," you state with regard to the new library to be erected for the solicitors, "that the assessors, Messrs. John Burnet and Son, of Glasgow,

selected the design by Mr. J. B. Dunn, of George-street, Edinburgh."

As I did not select Mr. J. B. Dunn's, you will perhaps be good enough to correct this statement in your next issue.—I am, &c.,

JOHN JAS. BURNET.  
167, St. Vincent-street, Glasgow, July 27.

## Intercommunication.

## QUESTIONS.

[9695.]—**Shingled Spires.**—I should like to know of any old spires covered with shingles, how long they have lasted, the size generally used, and the wooden construction of spire. One or two authenticated examples would suffice. Is any preservative solution put on at first?—Q. E. D.

[9696.]—**Acoustics.**—Is there any rule to be observed in designing a concert-hall to prevent echo or too much resonance?—ARCHITECT.

[9697.]—**Haddon Hall.**—I shall be glad to know if any large details have been published of the woodwork. Is there any book published describing and illustrating this residence?—H. H.

[9698.]—**Surveying Instruments.**—Which are the most necessary for the use of a country practitioner in a small way of business? Is a theodolite really required?—ELLIPSE.

[9699.]—**Refectory.**—I should like to be informed if there are any apsidal-ended refectories in England. If so, where? Also, on what side of the cloisters was it usually placed?—MONACHISM.

[9700.]—**Quality of Woodwork.**—According to Gwilt's "Encyclopædia of Architecture," under the section "Specification," it states, in connection with the carpenter and joiner's work, that "the oak is to be of English growth, and the timber not specified as oak to be of the best Dantzic, Riga, or Memel yellow fir. No American, Swedish, or Scotch fir to be used in any part of the building." Is not a good deal of American timber used now in buildings, and is the above clause generally applicable at the present time, or ought it to be modified, and if the latter, in what way? It also states that the timber and deals are to be "entirely free from sapwood, shakes, and large knots, and all other defects." Is there such a thing for building purposes as wood entirely free, or should the clause be understood in carrying out work, to be very or fairly free, as in actual practice I find, in taking objection to wood, the contractor will reply that the work is very free, and it is unreasonable to expect better for structural purposes, as only for cabinet work can the material be got entirely free.—FAIRATION.

[9701.]—**Salting in Cement Work.**—I have a porch of brickwork (whether built in lime mortar or not I do not know) covered with Portland cement stucco. It has been built ten years; the undersides of the cornice and fans and soffit of entablature continue to be much disfigured with a white frosting similar to that which occurs on new brickwork. I have had front face and top surface of blocking, the top of weathering of cornice, and the back face of entablature inside the porch painted four oils; still the frosting is reappearing on outside, inside, and soffits of entablature and on soffits of cornice. Can anyone suggest some wash which will remove and neutralise this without altering the appearance of the surface of the stucco? The painted parts are mostly out of sight and finished the colour of the stucco, the object being not decoration, but to keep out the wet.—Z.

[9702.]—**Outside Plastering.**—I shall be glad to have the experience of any reader as to the behaviour of Parian or Keene's cements for outdoor stucco work. Also the best material that can be used for outside plastering to receive immediate painting.—OLD BUILDER.

## REPLIES.

[9692.]—**Californian Red Wood.**—Californian red wood is regularly on the London and Liverpool markets. It reaches us in planks of mixed lengths, breadths, and thicknesses, some of these, owing to the giant trees they are cut from, being 5ft. in breadth and perfectly sound and clean. The price is somewhat high, owing to the enormous distance it has to be brought to market. It ranges from, say, 3s. 6d. to 4s. 6d. per cube foot, the shippers stating that nothing short of the latter price is a paying one on this market. The American red wood "W. R." read about some years ago was no doubt the ordinary Quebec red pine, which, as he states, is good for timbering, joinery, external or internal, and even for piles for water work. This timber can scarcely be told from the Baltic red or yellow fir; but it is quite a different thing to the Californian red wood. The Californian red wood was brought into great prominence at the International Exhibition of Forestry held at Edinburgh in 1884. The bark of a gigantic tree was there set up, the floor being a section of the tree. This bark formed a large room, on the walls of which were hung scenes from the red-wood forests; planks of enormous size were exhibited, the plain and the highly-figured varieties being well represented. The Californian Redwood Co., of 406, California-street, San Francisco, exhibited a suite of rooms fitted up and furnished in this wood, the appearance of which, under dull or bright pile, was highly pleasing. This work was designed by Mr. Scott Marton, and, I believe, executed in Edinburgh, where a great number of the shares of this company were held. The finest and the only work to my knowledge on this particular wood was published by this company in California in 1884. It is entitled "The Redwoods of California: a Glimpse at the Wonderland of the Golden West," by G. W. Bounce, Eureka, California, a copy of which, illustrated by photography, I have before me. If "W. R." wishes for further information on this subject I can refer him to an article I wrote upon this wood for the pages of the *Timber Trades Journal*. It appeared in the numbers dated Sept. 27 and Nov. 8, 1884, the first cargo of this wood, consigned to Messrs. Churchill and Sons, of London, being then afloat.—W. STEVENSON, The Park, Scarborough.

## LEGAL INTELLIGENCE.

**RESPONSIBILITY OF QUANTITY SURVEYORS TO CONTRACTORS.**—**PRIESTLEY AND GURNEY V. STONE.**—(High Court of Appeal, July 30. Before the Master of the Rolls (Lord Esher), Lord Justice Lindley, and Lord Justice Bowen.)—This appeal, heard on Monday, was brought by a firm of builders, the plaintiffs in the original action, to set aside a decision by Mr. Justice Fitzjames Stephen, who sat without a jury, in January last, in favour of the defendant, Mr. Frederick Stone, A.R.I.B.A., a quantity surveyor, which decision if upheld would show that in law a quantity surveyor is not responsible to the builder for the accuracy of his quantity, and cannot be made liable for errors or negligence where fraudulent intent is not proved. In this particular case the plaintiffs tendered for the erection of a Roman Catholic Church at Chiswick; the quantities were prepared by Mr. Frederick Stone, the defendant, and were obtained at the offices of Mr. Kelly, of London and Leeds, the architect for the church, in the usual manner, on payment of a fee, the builders tendering understanding that whichever firm was successful in obtaining the contract should pay the commission out of the first instalment due to them on the architect's certificate. The plaintiffs tendered with other firms, and their tender was accepted. The quantities were soon found to be deficient in many particulars, and plaintiffs objected to pay defendant the balance of his commission without a letter promising to make good the deficiencies they alleged to exist in the quantities. The undertaking asked for was not given by defendant, and plaintiffs thereupon brought an action to recover damages for injury caused by the alleged negligence and breach of duty of the defendant as quantity surveyor in preparing an inaccurate bill of quantities. The defendant put in a counter claim for balance of his account. The plaintiffs based their claim upon the ground that the defendant, by preparing the bill of quantities represented that the same was correct, and would be sufficient for the building of the church according to the plans, and that it was the duty of the defendant to use ordinary care and skill in the preparation of the bill of quantities, knowing that tenders would be made upon the faith thereof. The defendant, in his statement of defence, denied that he was negligent, and said that there was no privity of contract between him and the plaintiffs, and that he did not owe any duty to the plaintiffs. He also denied that there was any inaccuracy in the bill of quantities, and alleged that the plans were altered after the quantities had been prepared. At the trial in the Court of Queen's Bench, before Mr. Justice Stephen without a jury, the judge directed a nonsuit to be entered, and gave judgment for the defendant upon the counter-claim. (See article in the BUILDING NEWS for Jan. 27 last, page 185, Vol. LIV.) The plaintiffs now appealed. Mr. Edwyn Jones as before argued for plaintiffs, urging that, owing to the case having been stopped by the learned judge, material points affecting custom as to quantity surveyors' liability for gross negligence were not sufficiently brought out. The mode in which the quantities were prepared before the specification was written showed, he urged, that many of the items were mere guesswork, and that in itself, if proved, would amount, he submitted, to gross negligence. Certain necessary features, such as the corbelling for stone cornices and works in hoop iron, were deliberately omitted from the bill of quantities—it was said by instruction of the architects. Plaintiffs tendered in good faith that the quantities contained all the work required, whereas, owing to defendant's negligence, it did not. He quoted the case of "*Scrivener v. Pask*," heard before Mr. Justice Blackburn and also that of "*Heaven v. Pender*," which latter case went to show that where one person was so placed with regard to another that he would occasion injury to that person unless he used ordinary care and skill, a duty arose to use ordinary care and skill to avoid such danger. He also drew attention to the eleventh clause of the contract, which provided that there should be no remedy as against the building owner for any mistakes in the specification or other documents. Mr. Spokes, for the defendant, was not called upon, the Court being unanimous in dismissing the appeal. The Master of the Rolls said that the course pursued by counsel was very unfair to the judge, for from the notes there appeared no symptom that the action was abruptly stopped. The case of "*Heaven v. Pender*" had no more to do with the present action than with one of breach of promise of marriage. The custom of employing a quantity surveyor had been in existence for sixty or seventy years, and hitherto no single case had been brought by a builder to fix the responsibility on the quantity surveyor for accuracy, which was sufficiently strong to show what the custom was. The contract as to taking out the quantities was not made between the quantity surveyor and the builder, but between the architect and quantity surveyor. The architect selected a man to take out the quantities, and employed him, and the quantities were handed to the architect. The quantity sur-

veyor had no control over the way in which the bill of quantities might afterwards be used, and had no knowledge as to the persons to whom they might be submitted. Indeed, it might chance that the proposal to build would be abandoned, and they would never be used at all. As a fact the quantity surveyor did not know that his quantities would be used by anybody, and certainly whether they would fall into the hands of any particular person. They did not, therefore, amount to a representation that they were true in fact. They were given to the architect, who could check them, and no action for false representation apart from fraud could be based upon their alleged deficiencies. If wrong as against the building owner, the architect would be guilty of negligence, and if deficiencies in the quantities were fraudulently made, it was possible that the builders would have cause of action, but their case at the trial was not put on any such ground of fraudulent or even reckless statement. It had been arranged that in this case the amount of damage involved by the alleged negligence should be left to be determined by the official referee after a decision was given by the judge on the liability of defendant, but no evidence of reckless misrepresentation as to the quantities was given before the judge; there was no representation to the architect, and none at all to the world at large, as represented by plaintiffs, for as he had already observed, the quantity surveyor was not bound to conclude that his bill of quantities would be shown to any builder by the architect for whom it was prepared, for the architect might alter the proposed work before sending out the quantities to the builders. For all these reasons such an action as this had never been maintained, and hardly ever proposed. This was an attempt to manufacture a new case, in which out of a hundred actions not one would stand, and it was one which the Court would not sanction.—Lord Justice Lindley concurred, holding that the decision of Mr. Justice Stephen ought to stand. There was no privity of contract between the quantity surveyor and the builders, and the alleged custom relied on by plaintiffs was not proved, and even if such a custom had been proved, it would probably have been held by the Court to be unreasonable and bad, in accordance with the decision in "*Bradburn v. Foley*." It had been sought to be shown that the defendant in this case, Stone, made a negligent representation to the plaintiffs whereby they suffered damage, and that they were thereby entitled to take action; but they must look at the facts. The real truth was that the defendant was employed by the architect, probably as agent for a building owner, and was neither employed by, nor the agent of, the builder; he took his instructions from the architect and returned the quantities to him. There was no representation to the plaintiffs, and no evidence of merit of reasonable use. In his opinion the appeal ought to be dismissed with costs.—Lord Justice Bowen also concurred. The present action was without precedent. To the claim of the plaintiffs there were two fatal objections. There was no privity of contract between the plaintiffs and the defendant, and therefore no relation between the parties, and the defendant owed no duty to plaintiffs under the circumstances, as such duty could only arise from privity. It had been argued that the appeal would be supported on the ground that the defendant made a misstatement to the architect, knowing that it would be passed on to other persons, and that he was therefore liable for any damage they might sustain, as in "*Peake v. Derry*"; but in considering that case as an authority, it was most important to consider the meaning of the word "statement." It here implied a man's belief or opinion. If a man made such a statement, he either believed it or he did not; in the former case the statement was true—if he did not believe it the statement was fraudulent. The decision in "*Peake v. Derry*" would not therefore apply to such a case as this. A quantity surveyor was, as a matter of course, bound to take reasonable care in taking out quantities. But he made no representation that he had taken such care. He only represented that those were his quantities, therefore no amount of mere negligence on his part, assuming that it was not sufficiently gross to raise a question of fraud, could render him liable to the plaintiffs. Even assuming that a representation so reckless as to be fraudulent would render the quantity surveyor liable to the builder, no such evidence was given at the trial of this case. Appeal accordingly dismissed with costs to the defendants, Mr. Justice Stephen's decision being upheld.

**RIGHT TO LATERAL SUPPORT.**—**CROZIER AND CO. V. ROBINSON AND CLEAVER, AND MARTIN.**—This case was heard at the County Assizes, Belfast, on Monday and Tuesday in last week, before Mr. Justice Holmes. It was an action in which the plaintiffs, Messrs. Crozier and Co., claimed from the defendants, Messrs. Robinson and Cleaver, and Messrs. H. and J. Martin, builders and contractors, £7,000 damages for trespass to the house and premises of the plaintiffs, situate in Donegall-place, Belfast, and for un-

lawfully depriving the plaintiffs in the said house and premises of the support to which they were entitled from the soil and premises of the defendants, and negligently digging, excavating, and driving piles close to the plaintiffs' said house and premises, whereby the same were deprived of support and greatly damaged. The plaintiff, James McLees, sole member of the firm of Crozier and Co., gave evidence as to the damage sustained through the rebuilding next door of Messrs. Cleaver's premises, and Mr. W. J. Fennell, architect, supported his testimony, and deposed that it would cost £1,558 to put plaintiffs' house into as good a state as before the new buildings were commenced. Mr. Chas. Cheevers, civil engineer, corroborated, as did Mr. Robert Watt, C.E., Mr. Walter Doolan, architect, and Messrs. Fitzpatrick, Corry, Laird, and John Smith, builders, of Belfast. For the defence it was contended that all reasonable care was taken, and that plaintiff's walls were old and shaky. John Martin, one of the defendants in this action, and a builder and contractor, gave evidence in support of this contention, but in the result the jury found for the plaintiffs, £750 damages. His lordship gave judgment accordingly.

## PARLIAMENTARY NOTES.

**A GARDEN AT THE LAW COURTS.**—Lord Henniker, in reply to Lord Meath on Monday, stated that a sum had been placed at the disposal of the Board of Works for the purpose of defraying the expense of laying out as a public garden the open space adjoining the Law Courts, and that the work would be proceeded with forthwith. The site would within a certain time be probably wanted for an extension of the Law Courts. The First Commissioner of Works had allowed the ground to be put in order temporarily, reserving the power to take away the whole or any part of the ground at any time when required for public purposes. The plan to be adopted in laying out the ground was the design originally made by the late Mr. G. E. Street.

## WATER SUPPLY AND SANITARY MATTERS.

**CREDITON.**—Mr. Smith, C.E., Local Government Board Inspector, resumed on Friday an inquiry as to the water supply of Crediton, and to consider the application made to borrow the sum of £10,000 to carry it out. Mr. H. Oke Smith, accompanied by Mr. Appleton, C.E., attended to support the Watson scheme, which has received the approval of the Commissioners, whilst Mr. Sparks, with Mr. Martin, C.E., was present to advocate the claims of the Four Mills scheme. Evidence in support of the Watson scheme was given by Mr. Moon, surveyor; Mr. W. Lane, of Grattons; and Mr. Richard Sanders, of Exeter, retired engineer; and also by Mr. Appleton. Mr. Martin, C.E., then produced plans and specifications, with estimated cost of the Four Mills scheme, and evidence was given in its favour.

## CHIPS.

At Friday's meeting of the Metropolitan Board of Works the General Purposes Committee reported that the committee had authorised the architect, as a temporary measure, to call in the assistance of any one of the following advisers in cases of valuation in which it may be necessary:—Mr. R. Vigers, Mr. Christopher Oakley, Mr. A. Garrard, Mr. S. Walker, and Mr. J. W. Penfold. On the motion of Mr. Selway, the Board added, "And others whose names may from time to time be reported to the Board."

The parish church of Somerton, near Banbury, is about to be restored, from the designs of Mr. J. D. Sedding.

The whole of the lightning-conductor system at the Whittingham County Asylum, Preston, is being extended, and new earth-plates inserted to insure a more perfect termination; also twenty new lightning conductors are being erected for the further protection of this extensive establishment. The registered system of Mr. Jos. Blackburn, of Nottingham, has been adopted, and the work is now being carried out by that firm.

A large Cambridge quarter clock, showing the time on four external illuminated dials, 6ft. 6in. each in diameter, with over 2½ tons of bell metal, has just been erected at the new premises of Messrs. Beecham and Son, St. Helen's, Lancs, by Wm. Potts and Sons, clock manufacturers, of Guildford-street, Leeds, who are now erecting a new illuminated striking clock at Birkdale Town Hall, Lancs, and just completed a public clock at Middleton-on-the-Wold Church, near Hull, which is situated on the new railway to Bridlington, where there will be a station. The above firm are also making new chimes for the parish church at Leeds.

# Our Office Table.

By the sudden death of Mr. Frank Holl, R.A., at the early age of 43 years, on Tuesday last, the greatest portrait painter of the day has passed away. His portraits, full of masculine character and expression, have been a noteworthy feature of the last eight or nine Academy Exhibitions, and have included many of the most eminent of his contemporaries. The son of the engraver, Francis Holl, A.R.A., who died in 1884, Frank Holl entered the Academy schools at the age of fifteen, and gained a silver medal two years later, and the gold medal and a scholarship in the following year, 1863. Five years afterwards he won the two years' travelling studentship, and devoted himself to *genre* pictures of a pathetic and sombre type, the first to be hung at the Academy being entitled "The Lord giveth and the Lord taketh away." In 1878 he was elected an Associate Academician, and soon afterwards, inspired by the success of his portrait of Samuel Cousins, the engraver, he decided to devote himself to portraiture. In 1883 he was elected an Academician, and since then has frequently, as this year, contributed his full quota of eight portraits to the exhibition. The best of this year is undoubtedly that of Earl Spencer, No. 221, that of Sir William Jenner, No. 228, which hangs near by, being a good second. In 1885 Mr. Holl painted for the Royal Institute of British Architects a portrait of the late Sir Horace Jones, the retiring president. His last work is a portrait of Mr. Cornelius Vanderbilt. Mr. Holl's house, the Three Gables, Hampstead, where he died, was the subject of a double-page illustration, from Mr. Norman Shaw's drawing, in the BUILDING NEWS for Sept. 8, 1882, being No. 19 of our Artists' Homes series.

On the 28th ult. a marriage was celebrated at St. Saviour's Church, Warwick-road, between Mr. Edgar Farman, hon. sec. to the Society of Architects, and Miss Adelaide Hammond, eldest daughter of Mr. G. W. Hammond, R.A.M. Amongst the numerous guests who sent presents were Princess Colonna, the Countess de Labaume, the Countess Telfner, Mrs. Mackay, Mrs. Hungerford, Rev. S. Farman, M.A., and Signor Arditi. The architects we noticed in the church, among others, were Mr. W. H. Seth-Smith, P.S.A., Mr. H. Roumieu Gough, F.R.I.B.A., Mr. B. Tabberer, F.R.I.B.A., Mr. Romaine Walker, Mr. G. A. T. Middleton, A.R.I.B.A., Mr. T. Richards, M.S.A., &c., &c. The Registration Act Committee took advantage of the occasion to present Mr. Farman with a magnificent Louis Quatorze clock in recognition of his arduous work in connection with the objects of the committee.

MR. O. V. MORGAN, M.P., writes suggesting that the Albert Palace, now unused, empty, and in the official receiver's hands, might well be utilised as a technical institute for Battersea. The building is, in Mr. Morgan's opinion, specially adapted for such an institution. The whole place is in splendid order, and very little would require to be done to fit up classrooms, gymnasiums, &c. The extensive grounds which form part of the property are well adapted to recreative purposes, and he makes an appeal to the Charity Commissioners and to the committee of the South London Polytechnic Institute to see whether they cannot find means to adopt this building as one of the three centres.

A MEETING of Masters of Schools of Art was held on Wednesday and (by adjournment) on Thursday week, in the Lecture Theatre of the South Kensington Museum, to form an association representative of their interests and of the interests of art education. About sixty gentlemen attended from all parts of the kingdom, and a society was established to be called the Society of Art Masters. Mr. Edw. R. Taylor, of Birmingham, was appointed chairman for the ensuing year; Mr. Alex. Fisher, of Brighton, vice-chairman; and Mr. Francis Ford, secretary. Membership is limited to the holders of an Art Master's certificate (third grade) from the Department of Science and Art.

The Devonshire Association held its 27th annual meeting at Exeter on Tuesday and Wednesday in last week. The Dean (Dr. Cowie) presided, and delivered an inaugural address on the first day, having as its subject the progress

of science and literature. On the second day an inspection was made of the principal features of the city, and numerous papers were read, including one on "Science and Art in Devonshire Villages," contributed by Mr. J. Phillips, and another by Canon Brownlow on "Christmas with Bishop Grandison," a sketch of the condition of Exeter and its cathedral in 1368.

A COLLECTION of excellent specimens of works by the older water-colourists, and a whole series of the seventy-one mezzotint etchings of Turner's "Liber Studiorum," most of them first states, have been presented to the Art Gallery of Oldham by Mr. Charles E. Lees, of Werneth Park, and are now on view, the exhibition having been permanently opened to the public on Monday. The water-colours include seven pencil drawings on brown or grey paper by Samuel Prout (views in Venice, Milan, and Lisieux), two Yorkshire Abbeys by Thomas Girtin, two by J. Sells Cotman, of Norwich, and examples of De Wint, Copley Fielding, David Cox, John Martin, eight pencil sketches by Constable, and three early architectural studies by Turner.

ARRANGEMENTS have just been completed between the Birmingham School Board and the Museum and School of Art Committee of the Town Council for the supervision by the committee of the teaching of drawing in all the boys' departments of the Board Schools within the borough, and for the actual instruction in art subjects, at the Central Municipal School of Art in Margaret-street, by officers of that school, of the male pupil and candidate pupil teachers under the Board. In consideration of the annual payment by the School Board of £300, the Museum and School of Art Committee have undertaken the performance by officials of the school of these duties. The head master of the Municipal School of Art (Mr. Edward R. Taylor) will also give, at the beginning of the coming session, to all the masters of the Board Schools, an address, illustrated by diagrams, on the methods of teaching drawing. Not the least useful outcome of the scheme will be that after leaving a day school, and on joining classes connected with the Municipal School of Art, a boy will have already mastered many preliminary difficulties, and will also be able to continue his art studies in the evenings on the same system as will now be pursued in the day schools.

THE thirty-seventh annual meeting of the Birkbeck Building Society was held on July 26th. The report adopted unanimously by the meeting states that the receipts during the year ending 31st March last amounted to £9,394,559, making a total from the commencement of the society of upwards of one hundred millions (£109,698,081). The deposits during the past year were £7,170,342, and the subscriptions £182,989, while the gross profits amounted to £177,155. The surplus funds have been augmented to the extent of £377,255, and are now upwards of four millions (£4,051,899), nearly two millions (£1,830,133) being invested in British Government Indian and Colonial Securities, of which nearly one million and a half (£1,466,930) is registered in the books of the governor and company of the Bank of England, £1,434,800 of which consists of Consols and other securities guaranteed by the British Government, being an increase on the year of £35,992. In addition to the above there is a balance in the hands of the bankers of £341,846. The balance profit in excess of liabilities is £222,214. The twelfth triennial bonus (amounting to £23,713) has been allotted to the shareholders during the year. In addition to which, £15,000 have been added to the Permanent Guarantee Fund, which now stands at £125,000, the whole being invested in Consols. The subscriptions and deposits withdrawable on demand amount to £4,374,469. The surplus funds (which are invested in convertible securities) are sufficient to pay the depositors 105½ per cent. There are 49,763 shareholders and depositors.

There has been placed in the transept of the new parish church at Moffat, N.B., a stained-glass window, in memory of the Rev. Alexander Johnston (1765-1851). The subject represented is Christ's charge to Peter—"Feed my Sheep" (John xxi). It has been designed by the architect of the church, Mr. Starforth, and carried out by Messrs. Ballantyne and Son, Edinburgh.

## CHIPS.

On Tuesday the Archdeacon of Winchester laid the foundation-stone of a new mission building, in St. Bartholomew's parish, Southsea. The plans have been prepared by Mr. J. Henry Ball, of Southsea, and the building contract has been undertaken by Mr. D. W. Lewis, of the same town. The building will accommodate 400 worshippers, in addition to the choir, and the chancel can be shut off from the body of the hall when the latter is required for use for secular purposes. In addition a vestry, a classroom, and kitchen are to be provided.

On Saturday memorial stones of new Sunday schools for the Wesleyan denomination worshipping at Gee Cross, Hyde, Lancs, were laid. The estimated cost of the building is £1,370; and the architect, Mr. G. Gill, of Ashton-under-Lyne.

A Jubilee memorial fountain was formally opened at Dalbeattie, N.B., on Saturday. The fountain, which is the work of the Messrs. Newall, Dalbeattie, is composed of three kinds of granite—Dalbeattie, red Peterhead, and Westerly (American). It stands 20ft. high on a platform 10ft. by 8ft.

The corner-stone of Roseash Church, which is about to be rebuilt from plans by Messrs. J. P. St. Aubyn and Wadling, of the Inner Temple, London, was laid with ceremony on behalf of the Mark Master Masons of Devon on Monday week. The work will include new walls, roof, windows, and flooring to nave, which is in an unsafe condition. Mr. J. Clotworthy, of Witheridge, is the builder, and the estimated outlay is £1,500.

A new grammar-school, erected at a cost of £10,000 from the Frances Ashton's Fund, was opened at Dunstable on Monday by Mr. Muddella, M.P.

The summer meeting of the Institution of Permanent Way Inspectors was held at Bristol on Saturday, under the presidency of Mr. A. Ross, of Manchester, who delivered an address on "Internal Communication from the Earliest Times to the Present Day." A visit was paid to the Severn Tunnel.

The memorial stone of a new school church was laid at Lower Penn, Staffs, on Thursday, the 26th ult. The building will accommodate 100 persons. It will consist of a nave and chancel, with a lock-up vestry screened off. The walls will be of stone, with Gothic windows filled in with cathedral-tinted glass. The builder is Mr. H. Lovatt, and the architect is Mr. T. H. Fleeming, whose estimate of the cost is about £550.

Lord Lothian unveiled on Saturday, in the Elder Park, Govan, near Glasgow, the statue of John Elder, the famous shipbuilder. The monument is a gift from Mrs. Elder, and is the work of Mr. E. J. Boehm, R.A. It is in bronze, and over 10ft. in height. The cost has been £2,000.

Holloway's Pills purify the blood, remove all obstacles to the free circulation through the lungs, relieve the engorged air tubes, and render respiration free, without reducing the strength, irritating the nerves, or depressing the spirits; such are the ready means of escaping from suffering when afflicted with colds, coughs, bronchitis, and other chest complaints.

**DOULTING FREESTONE.**  
**THE CHELYNCH STONE.**—The Stone from these Quarries is known as the "Weather Bed," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.  
**THE BRAMLEDITCH STONE** is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.  
Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

**HAM HILL STONE.**  
Greater facilities have been provided for working these Quarries, and the Stone can be supplied in large quantities at short notice.  
Prices and every information given on application to  
**THE HAM HILL STONE CO.,**  
NORTON, STOKES-UNDER-HAM, SOMERSET.  
London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.  
**HYATT'S LENS and "SEMI-PRISM"**  
LIGHTS for PAVEMENTS, STALLBOARDS, ROOFS, &c.  
FILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

**WM. OLIVER & SONS,**  
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD  
MERCHANTS,  
120, BUNHILL ROW, LONDON, E.C.  
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

BATTERSEA, S.W.—For the erection of a school to provide accommodation for 800 children and also a pupil teacher's school on the site, in Lavender-hill, for the London School Board:—

Kirk Bros. ... ..	£20,235	0	0
Hart, S. ... ..	19,700	0	0
Holloway, H. L. ... ..	19,552	0	0

Wells, H. ... ..	6,620	0	0
Cocks, J., and H. ... ..	6,594	0	0
Sparks, J. ... ..	6,500	0	0
Harris and Wardrop ... ..	6,493	0	0
Cousell Bros. ... ..	6,720	0	0
Gladding, W. (accepted) ... ..	5,587	0	0

PRESTON.—For erection of weaving shed at Ribchester near Preston, for the Ribchester Co-operative Cotton Manufacturing Co. Ltd. Mr. J. Bertwistle, F.R.I., Blackburn, architect. Quantities by the architect:—

(Accepted tenders.)

Ironwork—Engine, boiler, shafting, pillars, and gutters:—

Yates, W. and J., Blackburn ... .. £2,342 0 0

Masons:—

Kay and Finder, Longridge ... .. 1,659 13 0

Joiners:—

Lloyd and Millward, Darwen ... .. 777 0 0

Flagging and slating:—

Dean, J., and Co., Blackburn ... .. 882 0 0

Plumbing and glazing:—

Shaw, J., Blackburn ... .. 120 0 0

Plastering and painting:—

Fletcher, L., and Sons, Ribchester ... .. 195 8 0

ROMFORD.—For erecting covered yard and stabling at rear of the Woolpack Inn, Romford, Essex, for Messrs. Ind, Coop., and Co., Ltd. Mr. J. Hudson, 80, Leman-street, E., architect:—

Bentley, J., Waltham Abbey ... .. £889 0 0

Hammond, J. S., and Son, Romford ... .. 897 0 0

Gladding, W., Whitechapel\* ... .. 754 0 0

\* Accepted.

SOMERSET.—For alterations and additions at Durley Hill, Keynsham. Mr. H. Phelps Drew, 99, Gloucester-road, London, S.W., architect:—

Bastow, Bristol ... .. £1,333 0 0

Lewis, Bristol\* ... .. 1,308 0 0

\* Accepted subject to revision.

# To Municipal Authorities, Engineers, and Surveyors.

## JENNINGS' PATENT URINALS

FOR PUBLIC THOROUGHFARES AND RAILWAY STATIONS,

Have been adopted in all the principal European Cities. They are particularly adapted for public use, being simple in construction, strong, and most economical as regards the water supply.

## JENNINGS' STONEWARE DRAIN-PIPES

Have been specially selected and adopted, after severe tests, by the South Australian Government for the drainage of Adelaide. The Sockets and Pipes are made in one piece under great pressure by Steam Machinery from the finest selected Poole Clay taken from Beds on the works, and, by hydraulic testing, have been proved superior to any other pipes in the market.

Prices and particulars can be obtained from

GEORGE JENNINGS, STANGATE, LAMBETH, LONDON,  
And the Manager, South-Western Pottery, Parkstone, Poole, Dorset.

## F. BRABY & CO.'s PATENT GLAZING.

### GLASS SET FREE.

ALLOWING EXPANSION AND CONTRACTION, AND PRECLUDING BREAKAGE.

Absolutely Watertight. Painting & Putty Superseded.

OVER THREE MILLION FEET FIXED.

Drawings and Prices on application. Models and Sections on View.  
Special) AM 26a.

FRIDAY, AUGUST 10, 1888.

## ARCHITECTS' PARTIAL SERVICES.

[THERE is a class of employers who are anxious to obtain professional assistance, but who are less willing to pay the commission. They seek to obtain advice and fill at the least cost. We cannot blame the individual for trying to do what all of our kindred means are in the habit of doing—getting their commodities in the cheapest market, or on the easiest terms. On the whole, this sort of people are wiser than those who entirely dispense with professional aid, and who often find out their mistake. Skill and experience are worth buying, for a man cannot become his own doctor or lawyer, nor an architect without finding out his own shortcomings—without, in short, having a fool for his client." Thus, it is wiser for a man to obtain a design for a building than to proceed to build without a plan, or upon one of his own designing, as a great many are silly enough to do, and if he can get a good set of plans prepared at a small cost, he does not blame him. A by no means uncommon mode of setting about building is for an employer to go to an architect, and ask him to prepare a design or set of plans, and then to commence building operations by employing his own builder or workmen, dispensing with the services of the architect. The contract drawings are all made, specifications, and, it may be, quantities prepared, and builders are invited to send in tenders. These are found too high, and the owner makes certain alterations and determines to build without the architect's further help. He sees a builder, who promises to carry out the plan for a considerable reduction by making certain alterations, who suggests that the cost will be less if the work is solely intrusted to him. There are many too willing to jump at such an offer. They do not perceive how easy it is to reduce the quality and quantity of the materials; what a difference "second" quality bricks or inferior stone can make to the cost, how the alteration of a feature here or the omission of another there can diminish the cost and at the same time seriously injure the design. The bait takes, the plans are remodelled, and the work is commenced. The architect is quietly shelved; he sees the work commenced, and immediately sends in his claim for preparing plans and specifications. The account is disputed, the employer says he has not made use of the plans, and the architect has to sue to obtain his commission.

A more artful mode of proceeding is the following:—An architect is instructed to prepare the necessary plans and specifications. These are accepted, but not finally approved. The matter remains in abeyance for some time. The owner takes advantage of the delay he has procured. The plans are submitted to friends who make suggestions, the owner sees other buildings, his object being to obtain all the hints he can. A very usual course is to affect that he does not intend to build directly. The architect waits. A few months, or it may be a year or more elapse, when the architect finds to his astonishment that the building has been commenced, but that he has not been further consulted. The owner has put his plans into the hands of a builder to carry out. Anger and disappointment seize the architect, he sends in his account for preparing plans; the evasive reply comes that the original design was of no value—it is returned; in some cases a request to render an account for services is

sent, after which the owner begins to build. In either case the services have been of use, the architect is the sufferer. Though sundry modifications may have been made, ideas have been appropriated. It is astonishing how some people will persuade themselves that an idea is theirs that they never heard of or saw before till someone happened to mention it or show it to them, and the ideas of an architect are everything. A plan, for instance, may be modified, but still the idea of the designer is taken with the modification. One glance at a design may be enough for a clever crib to take all that there is valuable in it, so a man may deny *in toto* that he has used any of an architect's design, and all the while he may have benefited immensely by the study of the drawings. In short, the owner may have robbed the brains of the architect and yet deny his liability to him. For the good of the profession there should be a law to compel a man, after approving of the design, to adopt it, or, if not carried out, to enable the architect to charge for his skill on an adequate scale. As the two parts of an architect's work are separable—design and superintendence, injustice is frequently done by persons paying for the greater half of the work at half-price. The profession have to blame themselves for permitting the notion to be entertained that architecture can be copied at liberty, or that the art may only exist on paper, and become a trade of selling and buying plans. The public have been taught to believe that plans can be bought anywhere, that there is no thought or labour in making them. Books of designs abound, and one's original idea in plan or design may be very like another's—so much so, indeed, that it would be hard for one to say which design claimed priority in point of merit. The same idea of arrangement or combination may strike more than one mind. We have indeed seen plans so much alike that it would be hard to assert that one of them was not a copy of the other. Published books of designs have been instrumental in multiplying the same design, and have done the profession more harm than good. Our readers will pardon this digression, the purport of which is to show that the profession, by making their designs too cheap and overflooding the market with stock plans, have injured themselves in the eyes of the public.

A correspondent the other day brought before us the circumstances of a case very similar to those we have pointed out. An architect agrees with the building owner to furnish plans, specifications, and superintendence at a certain percentage, and quantities at an additional percentage. The owner employs his own men or contractors to carry out the different trades, but does not consult the architect; the charge for quantities is disputed, and the works are underlet to different tradesmen with the object, it is alleged, of saving the architect's commission. There appears to have been a clear contract here in which the architect agreed for a certain sum to carry out the whole work. The design was, it seems, not prepared on approval; but instructions were given to do all that was necessary, and therefore the architect is legally entitled to his commission. If the building owner did not accept a tender, it is not the fault of the architect who, acting as an agent, has a perfect right to obtain quantities, and he is therefore entitled to claim for them. The custom of the profession is that, until a tender is accepted, the owner is liable for the quantities; but if a tender is taken, the owner's liability shifts to the contractor. The surveyor then looks to the contractor. The custom is at least a fair one; if the owner alters his mind by reason of the tenders being too high or other reasons, it does not appear just that the surveyor or the architect who procured the quantities should be the

loser. The quantity surveyor is in a different position to the architect; if the tendering is higher than the client was led to suppose, it is no fault of the surveyor, who is engaged solely to take off the items of material and labour in the architect's design, and therefore is entitled to receive his fees. The architect's claim for his work can only be set aside reasonably, when the cost so far exceeds the estimated amount that the owner is justified in contending the contract between himself and his architect is broken. And there is need of some understanding of this kind: an owner cannot expect that an architect's estimate can be always within a small sum of the actual cost, and a certain margin is justified; on the other hand, the architect must be reasonable, and ought not to expect a client of moderate means to fulfil an engagement when the cost is perhaps double that which he was given to expect it would be. If parties would only agree at the onset in writing, all doubt would be set at rest; but instead of doing so, custom is appealed to, and a jury would naturally ask whether the custom is a reasonable one. An architect can always if he chooses decide upon what terms he will undertake to prepare plans and specifications, what he is to be paid if the owner abandons his intention, or does not engage him to superintend the work. An immense amount of trouble and litigation would be saved by so agreeing. In the schedule of charges proposed by the Western Association of Architects of America the charges for partial services are as follows:—preliminary charges, 1 per cent.; such work including general drawings and specifications, 2½ per cent.; including details, 3½ per cent. The latter percentage is certainly not too much, as these preliminary services include the higher functions of the architect's duty; the client obtains the benefit of that work, and can use it hereafter, as we have seen he often does, to the prejudice of the architect. At the present moment there is nothing to prevent an individual obtaining an architect's design surreptitiously, afterwards pleading that the cost is too much, or that the design is unsuitable. Hundreds of architects are willing to furnish designs on approval, and it is this class who are liable to be imposed on by unprincipled clients. The only understanding is that if the plans are approved, and the work is commenced, the architect will be engaged to carry out the building. But architects of this confiding disposition find that their designs are seldom approved. Why should they be, if the owner can obtain all he wants, and carry out the design at a percentage less in cost? The one remedy open to them is to resolutely refuse transactions of this kind, which have the tendency to lower the architect's services, and to place them on the same footing as goods submitted on approbation. So long as there are members willing to buy commissions on these terms, the public will be inclined to undervalue the services of the architect, and to imagine that it is open to them to decline paying for professional skill just as well as they can refuse to purchase an article of which they did not approve.

## LAND SURVEYING.—IV.

PLOTING.—ROAD SURVEYS.—TAKING ANGLES.

FROM the field-book of the last example (p. 100) it should not be difficult for the learner to plot the whole of the river survey to a scale of, say, 3 or 4 chains to the inch. Having drawn in its proper direction, the main chain line is laid down by the aid of a scale or beam compass pointing off the intermediate stations where the sides of the triangles meet the base-line. Construct the largest triangles by the beam compass made by lines 3, 4, 5, and 6. To do this, take the

distance in field-book of line 4, 610 links, and applying the point to station on base-line, describe an arc with the pencil point after it has been carefully adjusted to the length. Then from the next station, where line 3 crosses base-line, take the distance between 160 and 480 links = 320, and cross the arc by another arc; the large triangle can then be completed. In the same way lines 5 and 6 can be set out, taking care to obtain the distances in the field-book, transferring them to the scale on the beam compass. For the purpose of nice measurement the compass is provided with two beam heads which slide along the bar, and a clamping screw attached to one of the heads will fix it at any desired distance from the point. The beam head at the end of bar has a fine adjustment which moves the point a very small distance to correct any slight error

PLAN 6

in the first setting. If the intersection of triangles in the bend of river corresponds by scale exactly to the field-book, the construction may be assumed to be correct; if not, the process must be carefully repeated. If the error is again found, the chaining has been incorrectly entered, or an error in transferring the distance to the scale has been made. The other lines, 7, 8, and 9, forming the secondary triangle is set out in the same way, and when all the lines are plotted they are carefully checked by the scale from one station to the other, to see whether they agree with the entries of field-book. With some surveyors the main lines chained in the day are plotted at night, so that if any discrepancy occurs the lines can be re-chained next day: in this manner the main triangles are set out before the details are completed. Time is thereby saved, and accuracy insured.

We give an example here of a road survey by a chain only. The diagram (plan 6) needs little explanation. First, the chain line  $b, c, d, e$

is measured, after being poled out, the assumption being that the fields on each side of road can be ranged through, and the chain dragged through the hedges. At  $a, b, h, c, d, f, e$  in the road, stations or poles are fixed, and the lines between them measured, the main base line becoming a check or proof line to the triangles. Stations  $a, b, h, c, d, e$ , on the road are left as the base line is chained, taking care that the three poles  $h, c, g$  are in a line, and for this purpose the poles must be regulated accordingly. The same remark applies to line 3. When the adjoining lands cannot be traversed by a base line, the lines can only be taken along the road, and the angles and the bends measured by the theodolite. For a survey of this kind the field-book is very simple, only showing the bends of the road on one side and the other of the chainage column.

## TAKING ANGLES.

By supplementing chain surveying with the theodolite, many of the difficulties met with, and much of the time spent in chaining the lines, are avoided. The surveyor will not be long in discovering which will insure him the best results—the chain only, or the chain and theodolite. Very often a combined use of the two methods can be employed with very decided advantage. Take, for example, a simple quadrilateral field or inclosure. The sides can be chained, and one or more tie-lines or a diagonal taken; but the same result can be accomplished by chaining the sides and taking two internal angles with an instrument. The angles can be entered in the field-book thus:

From $\odot A$	$82^{\circ} 29'$	to $\odot C$
$\odot B$		From $\odot B$
		$110^{\circ} 26'$
		$\odot C$
		$\odot D$

Or they can be shown on a sketch of the fields, a plan preferred by many surveyors as being simpler. To plot the angles the centre of protractor is placed exactly on the station of the base line first drawn, and the zero or 360 in line with it, and prick off from the arc the degrees and minutes as accurately as possible. (The electrum or vulcanite circular protractor sold by Stanley is the best. The degrees can be read either way.) Draw a line through the marked point, and the angle is given. The angular instrument is also used with advantage for continuing base lines obstructed by buildings and water. We have already shown how the line can be continued by erecting perpendiculars on each side of the obstruction (see page 99), or by taking angles with the chain; but these processes are laborious. With a simple box sextant the operation is rendered much easier. Having arrived at the obstruction A (Fig. 6), fix a peg down, set the vernier of sextant to 90, then, standing directly on the point A, look through the hole in box towards a pole put up a little behind on the same line, and direct with the hand the man with flag at  $a$ , which will give the perpendicular. A similar perpendicular is raised at B to  $b$ , and the distance  $a b$  measured as before. In carrying a line over a river the operation is much less tedious than it is with a chain, as we explained page 99. Referring to Fig. 10, a flag is put up at a convenient distance on the bank of river. Erect a perpendicular  $a b$ . At  $b$  place the theodolite, and measure angle  $a b c$ . Clamp lower plate, and turn telescope round, and set it to the same angle, fixing a flag at the point on base line B on the other side of river. Then the distance  $a c$  will equal the distance across  $a B$ . Thus, one turn of the instrument is sufficient to do that which required the measuring of four lines. Other means will suggest themselves to the surveyor, and we shall give one or two examples as we proceed.

In surveying a field with several sides, poles or flags are fixed at the angles or

stations; the sides are then regularly chained and two or more angles taken, those only being selected for instrumental measurement which fix lines. Very obtuse angles are best avoided. One problem in Euclid ought to be kept in mind. In Book I, Prop. 32, it is enunciated that in any rectilinear figure the interior angle and its adjacent exterior angle are together equal to two right angles, therefore all the interior angles, together with all the exterior angles, equal to twice as many right angles as the figure has sides; hence the sum of all the interior angles of a polygon is equal to twice as many right angles as the figure has sides, minus four right angles. Thus, in a 5-sided figure, the sum of all the interior angles is  $5 \times 2 - 4 = 6$  right angles, and  $6 \times 90 = 540$ .

As we have said, it is not always possible to run through lines or diagonals to fix angles. Let us take the case of an enclosure like a wood or an area walled or fenced in: external lines only can be measured, and it becomes necessary to take the angles between

PLAN 7

chain lines. We give an example of a wood where diagonals, or "tie" lines as they are called, cannot be taken in the ordinary way of ranging. A B, the base-line, is first chained and entered in the field-book, and poles fixed at all the corners of the wood, A B C. Having arrived at station B, the angle A B C is taken. The instrument is placed on station B, the zeros of the horizontal plate are clamped, and the object glass of the telescope turned to the pole at A; the whole instrument is then clamped and the upper one unclamped. The telescope is then directed to pole C, and the angle is read. Line B C is next chained and the instrument set on C; the angle B C D is taken. The C D is chained, and the angle D taken with the instrument. D A is measured and the angle C D A taken. As there are four right angles and  $4 \times 90^{\circ} = 360^{\circ}$ , the angles measured added together must equal that number, and

this is a proof of the correctness of the angles taken. Of course, it is not necessary to take all the four angles; two angles on the base line or opposite angles will be found sufficient if accurately taken.

One word as to chain scales may be useful here. Those in general use are according to the number of divisions to the inch—thus there are 10, 20, 30, 40, or more divisions to the inch; the 10 scale would be used as a scale of one chain to the inch, the 20 for two chains to the inch, and so on. The chain scale should have on one of the edges a feet scale, or 66 divisions on one side correspond with the 100 divisions or links on the other. The plotter can then use either side, dimensions in feet can be taken off from a plan plotted by the chain, or feet can be converted into links.

#### ARCHITECTURAL ASSOCIATION EXCURSION, 1888.

[WITH PHOTOGRAPHIC ILLUSTRATIONS.]

ON Monday next the annual excursion party of the Architectural Association will commence its programme, starting from Matlock Bath, where the headquarters will be located. The places to be visited include Derby, Longford (where there are some notable tombs), Marston - Montgomery, Somershall-Herbert, Sudbury Hall (an excellent specimen of the Domestic architecture of the 17th century in red brick), Hilton, and Etwell. Wingfield Manor, Hardwick Hall, Bolsover Castle, Haddon Hall, and Wollaton are the chief buildings to be seen during the week, and Ashbourne and Bakewell furnish the principal churches. Chesterfield, Tissington, Norbury where there is some good stained glass and a manor house, Bradbourne Church, Brassington, Youlgrove, and Nottingham make up the list with those previously mentioned. Without anticipating the proceedings, we have to-day, with this preparatory notice, printed some excellent views of two of the most interesting specimens of Derbyshire architecture arranged to be seen on the present occasion, and next week other photographic illustrations will accompany our report of the excursion. The photographic plate herewith is composed of five reproductions from two silver prints of Wingfield Manor and one of Ashbourne Church, by Mr. Richard Keene, the well-known photographer at Derby. Of Wingfield Manor the following particulars concerning its history are of importance, and especially is this so, because the buildings now standing form but a very incomplete and fragmentary portion of those which once were included within the outside walls of this great mansion, which was then known as Winfield, though enough exists to indicate its original dimensions. Mr. Edmund B. Ferrey, F.S.A., in his useful and fully-illustrated folio monograph of the place, privately published in 1870, presents us with several carefully-arranged facts relative to its historical data and architectural features. The building occupies a commanding site on an eminence surrounded by fine trees, and from the Ambergate Junction and Chesterfield Railway it presents an imposing aspect, boldly rising its elevation over the landscape. The mansion was built by Ralph Lord Cromwell in the reign of Henry VI. It consists of two great courts, the extreme length of the entire enclosure being 416ft., with an average width of 220ft. The great gate-house is in the south-east angle of the outer or south court. On the left is a fine old barn; but the remainder of the south and the whole of the east and west sides have been ruined. One portion of the north side of this court that divides it from the inner court is now used as a farm-house; but only the outer walls of this building are original. The small, upper photograph on the accompanying plate shows this structure on the right hand of the picture. The gateway on the left in the view forms the entrance to the inner quadrangle, and it is fairly perfect. The continuation of the same block is very picturesque, with the great chimneys and high tower still standing to the left, measuring 72ft. to the summit, from whence a splendid view of the courtyard are the remains of the state apartments, which were occupied on two occasions

by Mary Queen of Scots, about whose enforced residence at Wingfield (in 1569 and 1584) several particulars are preserved in the Public Record Office. Sir Ralph Sadler, in a letter written from Sheffield Lodge in August, 1584, tells Sir Francis Walsingham that he had entreated Lord Shrewsbury not to remove the Queen from thence to Winfield till Elizabeth had sent her orders, for he "had rather keep her at Sheffield with 60 men than at Winfield with 300." Many attempts to rescue Mary were made, but failed, and some think her escape was intended by the Earl. The south front of the banqueting hall, with its beautiful oriel bay window and charming porch, furnished the most interesting portion of the existing ruins. The lower view herewith illustrates the entrance, and beyond is seen the gable of the return block of buildings, once occupied by state apartments, with a large hall over them, the traceried window of which is a good example of the style. The external archway to the "Portal" has capitals of peculiar section. In "The History of Winfield," by Thomas Blore, F.S.A. (1793), a view is given of the chamber which existed above the entry. The Haltons spoiled the banqueting hall in the 17th century by dividing it into two stories for dwelling-rooms, and the mullions to the windows of the hall on the north side are of that date. In 1774, another member of the Halton family (the Haltons purchased the estate from the Duke of Norfolk and from the Lord of Shrewsbury) built himself a residence at the bottom of the hill, and pulled down some of the ancient manor house buildings for the sake of its materials. Below the hall is a large groined apartment or undercroft, usually known as "the crypt," but no ecclesiastical associations are connected with it; neither is it altogether underground, owing to the fall of the site. It is thought to have been the retainers' hall. The masonry is rather rough, and nearly all the central row of octagonal shafts and wall piers vary slightly in height, while the vaulting ribs spring in a very irregular way from the abacus. The keystones to the wall arches are rudely carved; but the fan-traceried bosses to the vaulting are very richly detailed. The stone floor has been removed. Some traces remain of the ancient chapel, which was a detached building to the N.E. of the banqueting hall, and was reached by an open cloister or pentice, now gone. Beyond the "state apartments" to the west are the ample kitchen, butteries, &c., with the necessary cellarage. The east wing of the south quadrangle was occupied by the "Guard's Chambers," and above these was another series of rooms, as the two tiers of windows give evidence. The greater portion of the barn is evidently original; but the easternmost bay, which is wider than the others, was added subsequently at a rather later date, though it nearly accords with the remainder. The massive oak roof to this barn is notable. Around the north side and greater part of the east side of the north quad, is a dry moat, in appearance, which was probably made when the stone was quarried for the building of the manor house. Generally speaking, all the stonework is in an admirable state of preservation, and some portions of the moulded work look as if they had only just left the mason's banker, so sharp and well-defined are the arries. Lichen and moss do not thrive, and some years ago the ivy was removed from the walls to preserve them.

Mr. Ferrey further tells us somewhere in his book that the more important parts of the building are faced with ashlar (a crystalline millstone grit), which was probably obtained from Ashover Moor, about four miles distant. In the great irregularity of its walls, Wingfield resembles Haddon and other Mediaeval houses, and when in its prime must have even excelled that beautiful mansion in extent if not in interest. Unfortunately, the place was dismantled in 1646 by order of Parliament, and previously the house had suffered by the Parliamentary siege, Wingfield having been captured by the Royalists in 1643 under the Duke of Newcastle. We gave a sketch of the house by Mr. Langham in the BUILDING NEWS for Sept. 15, 1876.

Turning now to Ashbourne Church, which is situated in a beautiful valley watered by the Schoo or Henmore, a tributary of the Dove, some 15 miles from Derby, we reach a

most interesting building known for its spire as the "Pride of the Peak." William Rufus gave this church to Lincoln Cathedral in 1093; but it was during the present reign transferred to the Bishop of the Diocese. The existing building consists of chancel, nave with south aisle, north and south transepts, each with an eastern aisle, and central tower and spire. The total length internally is 176ft., and the spire is 212ft. high. Besides the eight modern bells there is an ancient sanctus bell at the base of the spire. With the exception of a few moulded stones, no remains of the Norman church exist. Our view shows the church from the west end. The chancel is Early English, and was restored by Sir Gilbert Scott in 1882-3 with the usual result. The remainder of the building, including the spire, is chiefly in the Decorated style of the 14th century, with Perpendicular insertions, and the walls were also raised by the addition of clerestories in the 15th century, when new roofs were put on throughout. The north transept formed the Lady-chapel, and the south one was known as the Bradburne quire. The whole of the ancient fittings have been swept away, except the north transept screen. The church was dedicated to St. Oswald by Hugh de Patishull, Bishop of Coventry, in 1241, as an ancient dedication plate affixed to the south-west pier of the tower records. The monuments are now in the north transept, and are of some interest. The memorial to Penelope, only child of Sir Brooke Boothby, who died in 1791, aged six, by T. Banks, R.A., is highly spoken of, and is executed in Carrara marble. In the main street east of the church stands the Free Grammar School, a fair specimen of plain Elizabethan architecture. In Wickes's "Towers and Spires" that of Ashbourne Church is the only Derbyshire example illustrated (Vol. III. plate 2), and it is the best in the county. The interior of the church is very light, and will well repay a visit.

#### THE METROPOLITAN BOARD OF WORKS INQUIRY.

THE Royal Commission resumed their investigations on Tuesday.

Mr. John T. Bailey, builder, said he was the owner of four plots of land near the White Lion, Putney. In 1884 building plans were submitted by him to the Board, at the same time that plans were submitted by Mr. Silcock, the adjoining owner. This year he learnt that Mr. Silcock had submitted amended plans, which would spoil the elevation, and, in addition, project the building a foot beyond witness's line. He found that these had been approved.

Mr. William G. Silcock said that in his original plan, owing to the fall of the ground, Mr. Bailey's balcony ran into his window, and to obviate that witness's plans were altered.

Lord Herschell said that it seemed somewhat hard, in a case where two persons sent in a joint plan which had been approved, and after one had begun to build, that behind the other man's back the adjacent owner should be allowed to vary his plan to the detriment of his neighbour.

Mr. Thomas Blashill, superintending architect to the Board, said the change in the plans was simply due to a mistake of the original architect.

Mr. M. Staniland said that formerly he was a partner with Mr. Webster, but he had merely a financial interest in the business. With regard to Mr. Beal's statement that while M.P. for Boston he had received £10,000 for being surety for the contractor for the Thames Embankment, in conjunction with Mr. Doulton and Mr. Jackson, he had publicly contradicted the whole of that evidence. He did not receive any money from the contractor, Mr. Furness, whom he did not know, and he had never had any business in common with Mr. Doulton and Mr. Jackson.

Mr. J. R. Jolly stated that he had on several occasions, when the reports of the Building Committee came up, protested against the practice of not stating the reasons why plans were refused.

Mr. George Furness, contractor for the construction of part of the Victoria Embankment, said that the contract enabled him to use the material from the Thames for the purpose of filling in. He received 6d. a load from the persons who deposited the material. There were about 200,000 loads. He received between

£40,000 and £50,000 altogether on the contract. He had paid no money to any officer of the Board. Mr. Doulton provided the sureties on the Embankment, the sureties being Clench and Clellan. Mr. Doulton was not one of the sureties, nor was Mr. Staniland. When contracting he did not know that he would be able to use the Thames material; contractors had to take their chance of such things. As to the Odessa Waterworks, witness said that, on the advice of his agent, he took the contract at something like 15 per cent. less than the amount stated in the concession. He had no agreement with Sir J. Bazalgette on the subject, and did not know that Sir Joseph had anything to do with it. In reply to Mr. Winch, witness said it had been the habit of the Metropolitan Board anterior to witness's contract to call upon the surety to finish the contract; consequently it was very difficult to get anyone to be surety and to give a personal guarantee.

Mr. Meadows White said the Board did not have sureties now. The practice now was to retain certain moneys in the hands of the Board—he thought the amount was five per cent.

Mr. A. de Tatton Egerton, M.P., said that he was a member of the building committee of the Board, but he had not been aware that Mr. Saunders and Mr. Fowler were employed officially in matters which came before the Building Acts Committee with reference to plans. He did not know of their connection with the alterations at the Criterion; but he believed he knew that Mr. Saunders had something to do with the Métropole or one of the other big hotels in Northumberland-avenue.

Mr. Emil Loibl, the former proprietor of the Pavilion, said he was desirous of keeping his premises, which he had built and held for 20 years. He had offered to the Board to pay a rent of £6,000 a year, and to go out at three months' notice. That offer was not accepted, and shortly after he increased his offer to £7,000 a year. They never answered his letter because two members of the Board and Goddard had been promised large sums of money by Mr. Villiers. By Mr. Meadows White: Witness offered to leave the £109,000 awarded him as compensation in the hands of the Board if they would let matters stand, as he did not want to go out. Mr. Villiers paid the same rent that witness offered. In reply to further questions, witness denied that the Board had offered him terms, although he had the £109,000 at his back. It was a "Board of Corruption," and they had done him out of £200,000. Because they could not get anything out of him, they kicked him out of the office.

Mr. A. G. Powell, solicitor for Mr. Loibl in some negotiations, put in a correspondence he had had with the Board, in which Mr. Loibl was warned not to spend a large amount of money in additions to his premises.

Mr. Loibl, recalled, in reply to Mr. Meadows White, said that he was a member of the Music-hall Protection Association. He denied that he had had a correspondence with the solicitor of that Association about the conduct of the Pavilion.

Mr. Meadows White then read Mr. Goddard's report on Mr. Loibl's application for a continuance of his tenancy. The report stated that up to the date of the award the Pavilion had been carried on in a proper manner; but since the character of the entertainment had undergone some change, and there had been a strong correspondence in the *Era* on the subject.

Mr. Hugo Wolheim, chemist, described the proceedings in connection with the Walter process for the purification of sewage, which he had laid before the Board. He complained of obstruction and unfair treatment, and referred particularly to delays and interference with samples. Seals were tampered with, so that certain experiments were of no value, and communications from him were withheld from the knowledge of members, as he conceived, unfairly. There must have been somebody at the Board who made it his business to prevent a fair judging of the results of his experiments.

Mr. E. Rider Cook, the present deputy chairman of the Board, stated that he had been a member for 23 years. He detailed the various steps the Board had taken in connection with the purification of sewage. He considered the Board had taken the best possible means to ascertain how they should deal with London

sewage. What the Board was now doing was in conformity with the recommendations of Lord Bramwell's Commission. He considered that their works at Crossness were the most magnificent sewage works in the world. As to Mr. Wolheim's scheme, the report from that gentleman's own referees showed that it would require ten times more time than the process adopted by the Board, and that it was much more costly. The Board were, therefore, obliged to discard it. The Board gave the fullest scope to the experiments with Mr. Wolheim's scheme. He regretted that one seal had been broken by an injudicious servant. The officer was severely reprimanded, and an expression of regret was sent to Mr. Wolheim. When the Board acquired the site of the Pavilion, and it was decided to continue the music-hall, it was arranged to meet the objections he and others held that a censorship should be exercised over it. Lord Herschell: We now know that the censor was in the pay of the proprietor. Witness said that at the time the question was discussed in a *bonâ fide* way, and the arguments used by those who voted against him were the arguments of honest and upright men. He added that several of the older members of the Board meant to seek election on the new London County Council, and he asked the Commissioners to issue an interim report which would remove certain imputations that had been cast upon them. Lord Herschell said the Commissioners would issue their first report within two or three months.

The Commission then adjourned to Tuesday next, Lord Herschell stating that they hoped then to finish the evidence at present available.

#### THE COLFE GRAMMAR SCHOOL DESIGNS.

THE five selected designs in this competition are on view at the Leathersellers' Hall, St. Helen's-place. No fewer than 163 designs were sent in. The design by Messrs. W. S. Weatherley and Jones has been selected by the committee, subject to the approval of the Charity Commissioners and to the report of Mr. Ewan Christian, F.R.I.B.A. In this design the hall is placed centrally, with the classrooms round it, there being two class-rooms on each side, separated by sliding partitions, a head-master's class-room on one side of the front block, and a laboratory corresponding in size and projection on the other. The hall is 57ft. by 36ft., and is top-lighted by a lantern. The class-rooms are each 22ft. by 20ft. 6in. with large side windows, and dual desks in rows, lighted on left hand; a future extension of class-rooms is shown by a block in the rear. The entrance is central to the Lewisham Hill front, a head-master's room with conveniences being on the left hand, and a common room, lavatories, &c., on the right-hand side. These rooms are convenient, and a good lobby approach is shown to the laboratory and class-rooms in front. A side entrance on the south side gives egress to the playground, a covered ground and gymnasium being shown in the south-east corner of ground. The entrances, with lobbies for hats and caps, are conveniently placed at each side at the end of class-rooms. "Q. E. D." shows a rather different arrangement of front rooms: the porter's and store-rooms are larger. In the elevation the authors have tastefully adapted Elizabethan features; the projecting end gables of front and the centre entrance porch with clock turret over are well managed, and the details have been carefully worked out. The section shows a rather meagre construction of roofs, a wide centre iron roof over hall, with large lantern roof down the centre, and two high-pitched roofs over the class-rooms, iron being largely used in the stanchions and roofs; air flues are shown in the breasts of chimneys in class-rooms.

Messrs. John Giles, Gough, and Trollope send a cleverly-drawn set of elevations quietly treated in a brick version of 17th-century English architecture with Late Gothic details. The great hall is central, 74ft. by 32ft. There are three classrooms on one side, and two on the other, with entrance between, leading by a covered way to a laboratory and block of lavatories. The front block, which is kept low, contains a central entrance and hall, head and assistant masters' rooms, and book-store. Over the low roof of this block is seen the

gabled end of great hall. The classrooms have low, flat roofs; clerestory windows over them light the great hall. Revolving shutters between the classrooms are shown, with coils for heating and Tobin's inlet tubes.

Messrs. Clark and Moscrop, architects, Darlington, have also a well thought-out plan. The hall is central and placed lengthwise, having three corridors round three sides, and a suite of three classrooms along the other side, with sliding partition, and glazed screens between them, so as to be able to throw the whole open to the hall. The latter is 64ft. by 29ft. 6in. On one end of hall are two classrooms and playground entrance forming a wing, and on the other end of hall a similar block, with laboratory and assistant master's room. The front block comprise the head master's room, book store, centre entrance, lavatories, &c. The hall roof has an open-timber roof. Externally, the style partakes of the English Renaissance period, with bold details; the end are pronounced by gabled ends, and the centre entrance by a gable carried above the eaves of a long, low, connecting building. A ventilating turret breaks the ridge line of hall, and the latter is lighted by a clerestory range on the roof. The turret forms an extract ventilating shaft, in which is a Bunsen burner. The details of heating show coils of pipe under the windows, with inlets for fresh air. A covered playground and gymnasium is placed along north side of ground.

The design by Mr. Horace T. Bonner, A.R.I.B.A., is also Renaissance in character, of brick, shown by a coloured perspective. The hall is placed lengthwise to the road, and is 62ft. by 32ft., with a platform and retiring-room in the rear. A front corridor broken by three bays or projecting windows for hats and coats, and two end corridors give access to the central hall, which has three classrooms along the front side. On one side is a porter's house and a classroom, and on the other the head-master's house, assistant-masters' and classrooms; these side blocks are semi-detached to the central or hall portion. The classrooms in front project and have gabled ends, the large hall being lighted by five mullioned windows over them. A centre fleche relieves the hall roof. Mr. E. Lyne Parsons, Exeter, who sends an able set of drawings, also adopts the centre hall placed lengthwise, lighted at top, with three classrooms along rear side, having movable partitions between them. The hall is 66ft. by 33ft. The boys' entrance is on north side, also one classroom and the porter's house as a retired wing. In the front are the head and assistant masters' rooms, a centre entrance, lavatory, and ante-room; the south side has a laboratory and classroom (head-master's) in front, a side corridor, and covered way to lavatories, &c., behind. The gymnasium is under south wing. The exterior treatment is of the Renaissance character, with centre tower, and gabled projections with pilasters introduced as a relief. There is undoubtedly merit in the selected design for its simple arrangement and grouped classrooms. The elevation is also suitable. The designs of Messrs. Giles, Gough, and Trollope, Clark and Moscrop, and E. L. Parsons show also a careful study of requirements.

#### SKETCHES OF DECORATIVE FURNITURE

OUR illustration to-day is of some decorative furniture, at Mr. John Milner's, Great Portland-street. The Oak Cradle is a good example of Jacobean oak work; good cradles are very scarce. The example given is a quaint and fine piece of work, in good preservation it was made about 1650, and came from Swale dale, in Yorkshire. The Chippendale Mirror is in mahogany, with carved gilt head and Vaux hall bevelled plate glass. These mirrors are much copied and used at the present time. The carved gilt Mirror Frame is an exceptional fine specimen of work of the Chippendale period. The Candlestick is an example of three-light Early 18th-century work, as is well known; the Dutch were famous for both brass and copper work of that period. The Kneehole Table is a specimen of a simple writing table made in the Chippendale period.

Mr. J. O. Richardson, of Albert-road, Peckham is the contractor for the works at the General Post Office, St. Martin's-le-Grand.

COURTS OF SCOTLAND SOLICITORS' LIBRARY, EDINBURGH.—ARCHITECTURAL ASSOCIATION EXCURSION, 1888.—"REDCOT," KNOCK, BELFAST.—HOSPITAL FOR INFECTIOUS DISEASES, KING'S NORTON.—INSTITUTE AND WORKSHOPS FOR THE BLIND, MANCHESTER.—MIDDLE-CLASS HOUSE AT HAMPSTEAD.—DECORATIVE FURNITURE.

## OUR LITHOGRAPHIC ILLUSTRATIONS.

COURTS OF SCOTLAND SOLICITORS' LIBRARY, EDINBURGH.

THE leading points in memorandum issued by council to competing architects were that plans should provide for a reading-room, library, and hall, the desire being expressed that these should be on the same floor and at present Parliament house level—a height of nearly 60ft. above Cowgate, the two upper floors alone being used for library buildings, and the under portion laid out in any way to obtain the best commercial return. Shops and dwellings were suggested by council. The new library is approached by a connecting bridge from present law courts, and as there is a considerable amount of corridor to be traversed, I thought it desirable that immediate access should be had to the rooms most in request—viz., reading room and library. This bridge leads at once into a spacious vestibule, a broad flight of four steps, together with a slope of 1ft. in 60ft., lowering the whole library floor by 3ft. Consideration of cost caused introduction of steps down so that better effect might be given to the principal rooms of library. The reading-room and library are entered off vestibule. The former apartment measures 30ft. by 22ft., and the library 68ft. by 48ft. over the bays, and 37ft. 6in. between inside of stone walls. This room is planned on the alcove system. The bookcase blocks are made to project at right angles to walls, which gives increased accommodation for books and leaves recesses for reading and writing. In order not to curtail wall space for books, and for more practical use of blank wall space for flues from dwellings, four of the ten alcoves are lighted from ceiling by inner lights. Abundance of light is also provided from the four sides and from cove in ceiling, which is entirely pierced with lights. These latter will be formed of an outer skylight, with an inner light of tinted glass. The total possible accommodation for storing books in library and book stores is 7,570 super. feet, which gives storage for nearly 70,000 volumes. The society's hall is only used three or four times during the year by the society for meetings, and will be afterwards fitted up as an additional library; consequently, the approach through library is not considered objectionable, although in Scheme No. 1, submitted by me, access was shown by a corridor under society's hall. The floor below is utilised for consulting rooms and book stores, the latter being directly under charge of librarian. Lavatory accommodation is purposely planned away from entrance, so that the appliances may not be used by numerous clerks frequenting Parliament House. Thirty model dwelling-houses and eight shops occupy the lower portion of building, and, by a firm of ordained

surveyors and house-factors consulted by the council of society, are expected to yield a gross annual return of over £400 per annum, the net rental being £300, after deducting 25 per cent. for factor's fees, repairs, and unlet property. A fireproof floor separates model dwellings from library. Strode's ventilating sunlights will be used for lighting library apartment, the Wenham lights being used in reading-room and society's hall. The heating of building will be low-pressure, hot-water radiators being placed in bay windows under dwarf bookcases. In winter fresh air will be admitted from outside, and passed through a grating at floor level, controlled by valve apparatus, and passed over radiators before entering room, the fresh air in summer being admitted by hopper ventilators placed in bay windows, the society's hall and staircase being similarly heated. The vitiated air will be extracted into a ventilating shaft in ceiling of library, the ventilating sunlights also helping when lighted to accelerate the action. The total cost ascertained from a firm of ordained surveyors consulted by the Society is over £13,000. Building operations will not be commenced for some time, as two months are expected to elapse before ground is cleared of present tenements.

J. B. DUNN.

## ARCHITECTURAL ASSOCIATION EXCURSION.

FOR description see p. 167.

## "REDCOT," KNOCK, BELFAST.

ENJOYING the advantages of a lovely site within easy distance of Belfast, "Redcot," which has been built for Mr. Thomas Paul, is constructed of local red brick, partially covered with lime plaster, the roofs being finished with Ruabon tiles. The builder was Mr. John Bill; the architect (by whom the drawing was done) being Mr. T. McC. Johnston, 28, Waring-street, Belfast.

## THE NEW INFECTIOUS DISEASES HOSPITAL AT KING'S NORTON.

THIS hospital is being erected on land purchased from the Ecclesiastical Commissioners, and is for the treatment of patients in the contributory place of King's Norton and the parishes of Northfield and Bexley. For the past five years the rural sanitary authority has had a temporary hospital in operation, in which 180 cases have been successfully treated—one death (from small-pox) only occurring. The new hospital stands in grounds six acres in extent, and no house is within 150 yards of it. It is inclosed on all sides by a boundary wall of brick, for which Messrs. Walton Brothers, Smethwick, were the contractors. The hospital, which is built on the pavilion system, is of red brick, with Bath-stone dressings, half-timbered gables and tiled roofs, and is intended, when complete, to accommodate 40 adult patients, with full staff of nurses. The buildings included in the present contract comprise administrative block, isolation block, ward block, mortuary, and offices. The administrative block provides accommodation for the caretaker and resident nurse, with bedrooms for extra nurses, medical officers' room, surgery, and stores. A serving-hatch is introduced in the kitchen for the convenience of nurses. The isolation block contains four wards and two nurses' rooms, communicating with each other by glass-covered corridors, attached to which are the usual offices. The ward block contains one ward for six (adult) beds, and one for four (adult) beds, allowing 2,000c.ft. of air space for each patient. But as the majority of the cases hitherto treated have been children, the capacity of each block is nearly double. The blocks are raised above the ground level, and surrounded by a terrace. Verandahs stretch along the front of each block, covering a walk of granolithic pavement. Upon this the patients' beds could be wheeled if wished, as there are French casements opening out on it from each ward. The offices comprise disinfecting apparatus (Bradford's improved sub-heating), a stable with loft over, washhouse, ironing-room, with radial drying stove (Bradford's), and store-rooms; over the stable is the water tower, which will carry a tank to contain 8,000gals. of water, from which all the blocks will be supplied. The water will be pumped from a well which has been sunk

90ft. deep to the rear of the tower; and on the tower it is proposed to place a 16ft. "Halliday" windmill, which will be sufficient to throw the water the requisite height; this authority having one already in operation at their Cottage Homes, which is found to do all that is required of it. The drainage of the hospital will be dealt with on about an acre of land in the S.E. corner. The roads are already formed, and the grounds will be laid out and planted with shrubs and trees. Should an epidemic of small-pox at any time visit the district, ground is reserved upon which can be pitched a number of tents in addition to the "Docker tent," which will be removed from the temporary hospital to the new one. The hospital being five miles from the surveyor's office, provision has been made to establish telephonic communication between them, and in all probability the blocks will be connected by means of speaking tubes to the administrative block. The specialties used in the construction of this hospital are: Jennings's paraffined wood block flooring, and Manchester grates and ventilators by Mr. E. H. Shorland. The complete plans, &c., have been prepared by the architect, Mr. Robt. Godfrey, A.M.I.C.E., the engineer and surveyor to the Rural Sanitary Authority. Messrs. Gowing and Ingram, Birmingham, are the contractors; and Mr. W. de Lacy Ahern, Stud. Inst. C.E., is the superintending architect. The estimated cost of the buildings, &c., being erected now is £5,200, without the wall or cost of ground.

## INSTITUTE AND WORKSHOPS FOR THE BLIND, DEANS GATE, MANCHESTER.

THIS building is now in course of erection from the designs of Messrs. Heathcote and Rawle, architects, Manchester. The sub-basement will be used partly for the boilers and steeping-tanks, and partly for storage; the basement for brush-making; the ground floor for retail shop and show-rooms; the first floor for the board room, and for a room in which to hold the Sunday and other gatherings; and the upper stories for various industries of the blind. Every floor, except the sub-basement, will have a glazed brick dado. With the exception of the carved panellings, and some of the lower piers, the whole of the frontages will be built in red and buff brick and terracotta. The present contract of £650 is undertaken by Messrs. Wilson, Toft, and Huntley, of Manchester.

## CHIPS.

The ceremony of laying the capstone of St. Michael's Church steeple, Coventry, was performed on Wednesday week by Mr. George Woodcock. A party of about fifteen ascended by the scaffolding to the summit—a height of 303ft. The contractor (Mr. John Thompson, of Peterborough) referred to the work, and thanked Mr. Woodcock for having started the restoration fund by a donation of £10,000. The work of restoration has been in progress about three years, and is expected to be completed before the winter. The only portions yet remaining to be done are the decoration of the interior and exterior of the tower and the insertion of thirty-six statues.

Lady Butler's picture, "Scotland for Ever," painted in 1881, has been presented to the Art Gallery now in course of erection at Leeds by Colonel Harding, of Headingley. Colonel Harding has paid Lady Butler £1,000 for the picture, which will thus have produced the painter £4,000, £3,000 having been paid by Messrs. Graves, of Pall Mall, for the copyright.

The Liverpool City Council have decided to reconstruct the Elliot-street frontage of St. John's Market, at a cost of £8,000, from plans prepared by their borough surveyor.

Colonel W. M. Ducat, one of the inspectors under the Local Government Board, held an inquiry at Newton Heath last week in reference to an application of the Local Board for sanction to borrow £1,700 for the paving and surface drainage of Droylsden-road. Plans and details of the proposed works, prepared by Mr. Wilkinson, the Board's surveyor, were laid before the inspector.

New offices have just been built for the Wands-worth district board of works at a cost of £6,400. Mr. C. Kynoch was the contractor.

The memorial chapel to Williams of Pantycelyn at Llandovery was opened on Tuesday last. The cost of the building was £2,200. Accommodation is provided for about 280 worshippers. The architect is Mr. John H. Phillips, M.S.A., of Cardiff.

WAYSIDE NOTES.

**W**HAT a pity it is that the hints on restoration work contained in the last R.I.B.A. *Journal* were not published prior to the year of Jubilee! If only the parties concerned could have taken to heart the lessons therein given we might not have to mourn the loss of so much beautiful Mediæval handiwork. Better late than never, however; as the information afforded should prove really useful. Certainly to architects undertaking a restoration job for the first time, the paragraphs so carefully set out in numerical order will prove a boon and a blessing. They may therefore be said to supply a long-felt want; and as they have been prepared under the supervision of three gentlemen of wide experience in church restoration, the hints come to us with much weight, and may be studied with confidence by young restorers—and old ones, too, for the matter of that.

One hint appears to me to be particularly worth attention; and that is, that where alterations and additions are made to an old building, such additions and alterations should be treated in a manner totally distinct from the original building. Really new work should not be in imitation of the old design. Putting aside the objections named in the Institute paper, it is sufficient to remember that the secret of many of the charming qualities of old cathedrals and churches is to be found in that variety of style which arose from the bold, open, and frank manner in which the old builders altered and enlarged existing structures. How much of the poetry of architecture would disappear if the architects of the Middle Ages had added to buildings in the style of their predecessors! Imagine the west front of Rouen Cathedral with the whole built in the style of the Early work at the base of its north tower by succeeding generations servilely copying the design of existing portions. The whole front would have been a fraud. There would be no true unity; and the unutterable glories of multiplicity of parts would have been wanting. In modern work it is exactly the same, and variation of style in added features has just the same charm.

I quite agree with most of the sentiments expressed in the essay on church restoration. One may, perhaps, be pardoned for wondering where are the architects who would be so delighted to receive advice and criticism while they are engaged on a restoration job?—although the writers of the hints may know. In theory we should all be overjoyed at such suggestions; but in reality I fear that there would be few found who would be so pleased at receiving criticisms from all sides *ad lib.* The S.P.A.B. generally prove sufficiently provoking; but we can well afford to excuse this pretty fancy, as the bulk of the essay is most practical, and, as regards utility, far above the average run of papers in the *Journal* of the Institute.

The Gloucester baths competition has gone the way of the majority of architectural lotteries. I note that the whole question is to be reconsidered by a special committee of the Gloucester Town Council. A pretty dance the Gloucester people have led their premiated architects! As matters now stand, it appears that the competitor placed first is in danger of losing the job. Meantime the second premium winner is making hay whilst the sun shines, by writing to the town council, and putting forward the merits of his own plan, &c., the which procedure might, I think, have been delayed till the so-called successful competitor had been overthrown by a report from the special committee—if he ever is.

There is another good architectural competition gone wrong—that for the Clapham Free Library. I quite think that Mr. John J. Jones was well advised in taking the course he did in this matter. If a few more would put their foot down when they see attempts made to impose upon the profession, as represented by themselves, we should be treated with more respect as time goes on. In this Clapham affair it seems to me that the commissioners felt ill at ease in awarding the first place to a design which did not comply with the instructions as regards cost; and that they therefore endeavoured to quiet their consciences by

drawing a cheque for ten pounds in favour of the second premiated competitor, who had submitted a design that could have been carried out for the stipulated sum.

Both the difficulty at Gloucester and the incident at Clapham have had their origin in that which, if not the root of all evil in architectural competitions, is yet responsible for nine-tenths. This is the money question, and a very difficult question it is, and one that has now been before us for a very long time. One can quite understand that if a building committee finds itself in possession of a design that is wholly superior to any other, yet costs a little over the stipulated sum, they will naturally feel that although they would like to deal honourably by the competitors, they do not care to erect an imperfect building when for a slightly increased outlay they can secure one vastly better suited to their wants. This difficulty has been the cause of innumerable heart-burnings and bitternesses in the past, and will continue to be so till the end of time, unless some plan be invented whereby it may be surmounted. In dual competitions the difficulty does not occur; but in small ones it is ever recurring, to the disgust of those concerned, though, perhaps, to the benefit of the architectural topical world, which, without a few competition squabbles, would tend to become dull in the big gooseberry season.

There are few things that are more annoying to the building owner than to find that his neighbour has, by "squaring" the authorities, been allowed to encroach upon the general building line. The extremely bitter feeling which an incident of this nature creates may be noticed in the present Board of Works Inquiry. Much of the animus evidenced against the Board by builders has been caused by the partial action of the Board's officials with respect to frontage lines. Yet another instance occurred at the last meeting of the Commissioners. Encroachments on the building line are annoying enough to the architect, but to the owner of the buildings encroached upon it is something more than an annoyance. The report of the Board of Works Commission will be looked forward to with great interest. It will be published in about two months.

I think that if Lord Herschell had been presiding at the recent meeting of the London School Board he would have discovered a few things worth further investigation. One cannot but conclude that the whole thing was a great farce. Does the Board imagine that a nice little family party amongst themselves gathered together to write a few letters and joke about serious matters will be the means of regaining the confidence of the public? If so, I fear that it will be grievously disappointed. As it was, with all the care taken, ugly facts would crop up. In the face of this and of the disclosures in the matter of past school building, it is urgently necessary that some inquiry be at once instituted. The amount of public funds at the disposal of the School Board is immense, and for this reason an inquiry is as important as in the case of the Metropolitan Board of Works.

Like your correspondent, "A Registrationist," I have been long wondering when we shall hear something about the inquiry which the Institute was to make in connection with the M. B. W. scandals. Some say that I may well wonder; but, then, people say such funny things! I cannot believe that the Institute is going to let the matter drop; because, were it to do so, it would be its death-blow. I repeat that it is impossible for the Institute to let this matter slide—impossible, because the charges to be investigated are of the gravest character. Why does not the council at once proceed to take such steps as will clear its members of these charges, if, in the eyes of the Institute, they be not serious? And if they be proved unprofessional, why is there not a considerable clearance at Conduit-street? In this matter I feel a callous indifference to the opinion of any section of the profession. All I can see is that the public sneer and joke at the mention of an architect; that this has been occasioned by the action of certain members of the Board of Works, and that these persons, being members of the Royal Institute of British Architects,

the credit of that body, and with it the whole profession, is at stake, unless measures be taken to prove the legitimate nature of the behaviour of the above persons. And yet everyone is silent! Save for the few communications that you have printed, no protest has been made, and no one has endeavoured to bring pressure to bear upon the Institute to persevere with the inquiry it contemplated, and to take measures—vigorous and severe, if necessary—that will insure us being, in some degree, lifted out of the unsavoury mire which threatens to engulf us. GOTH.

DISCOVERIES AT PETERBOROUGH CATHEDRAL.

**D**R. PEROWNE, the Dean of Peterborough, announces that in the course of the excavations necessary for underpinning the interior of the north transept of Peterborough Cathedral an interesting discovery has been made. Close to the western wall of the transept the workmen came upon a richly ornamented Saxon slab, covering a grave, and evidently still lying in its original position. It is of the date of the second Saxon church, of which considerable remains were discovered a short time since after taking down and rebuilding the central tower. The slab must mark the grave of a layman, and has lost during the Norman rebuilding a few inches from the top; the length remaining is about 5ft. 3in., with a top width of 1ft. 10½in. and a bottom of 1ft. 6in. The surface is completely covered with the richest Saxon interlacing ornament, forming a design of a central band of ornament about 5in. wide, crossed at right angles by rather wider strips of ornament. The design is that of a fourfold cross, each of the crosses being outlined with a double roll border, the inner one being twisted work. Three of the oblong spaces between the crosses are filled in with finer interlacing work, two with star crosses, and one is plain, having been left unfinished. The slab is, the Dean believes, the most beautiful specimen of Saxon ornamental work of the kind that has come to light. The committee have decided to raise the slab, keeping it on its present site, so that it may still mark the resting-place that it originally covered, but above the level of the new floor and guarded from injury. It was found close beside the spot where rest the remains of Bishop Dove, Queen Elizabeth's "Dove with silver wings." Portions of other Saxon slabs have also been discovered not far from the one described, of similar design, but of less elaborate workmanship; also a fragment of the raised monument of a Saxon abbot. Of Hereward's church, the outline can be traced to a considerable extent. The lines of the transept and the choir can be followed in the south transept, under the lantern, and in the nave of the present cathedral; but the nave of the Saxon church lay outside the present building. Measurements carefully made show that the present Norman cathedral is exactly double the size of the Saxon church.

The opening of the new storage reservoir for the Portishead Water Company took place last week. The storage has been supplemented by constructing a reservoir on the site of an old mill pond, near the spring head at Portbury, holding 1½ million gallons, according to plans prepared by Mr. Walter Minns, of Portishead. The contract of Messrs. George Biss and Son, of Portishead, was accepted, and that firm has carried out the whole of the works, having excavated 5,000 cubic yards and built a new retaining wall across the valley in thirty-four working days.

Standlake Church, Oxon., was reopened last week, after the completion of another section of the restoration now being carried out, from plans by Mr. Clapton Rolfe. The north transept and north aisle have been restored, and the slated roofs replaced by leaden ones, works carried out by Messrs. Barnes and Son, of Witney; and a new font and oak corbels and other internal works of carving have been executed by Mr. Harry Hems, of Exeter, who has in hand a parlous screen for the church.

Dr. Alfred Barry, Bishop Metropolitan of Sydney, and formerly Master of King's College School, who is nominated as Bishop of Chester, is a son of the late Sir Charles Barry, and younger brother of Mr. Charles Barry, F.S.A., and the late Professor E. M. Barry, R.A.

fixing, including joints in cement .....	
Case up and protect stonework, clean down, and	
leave perfect .....	

Carried to summary ...

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

KENT ARCHÆOLOGICAL SOCIETY. — The annual meeting of this Society was held on Wednesday and Thursday in last week, Hythe being selected as the head-quarters. The archæological portion of the proceedings commenced on the first day by a visit to Hythe Church and its Early English crypt, which was described by the vicar. Afterwards the party started in carriages for Studfall Castle, where the remains of the Roman Castrum were described by Mr. C. Roach Smith, F.S.A. From thence a visit was paid to Lympne Church and Lympne Castle, otherwise called the Arch-deacon's House, both of which were described by Canon Scott-Robertson. The next halt was Aldington, where the rector, the Rev. G. J. Blomfield, described the church of St. Martin and the small remains of the archiepiscopal manor house. An evening meeting was held at the Sessions House, Hythe, where papers were read by Mr. George Wilks on the town and church of Hythe, and by Mr. George Dowker on Studfall Castrum. Thursdays proceedings commenced with a visit to St. Martin's Church, Cheriton, and St. Nicholas Church, Newington, the rectory and church at Lyminge. At the rectory interesting relics dug up from Saxon graves at Lyminge, a large collection of rubbings from monumental brasses, and some valuable manuscripts and books were shown. Saltwood Castle and church were also visited.

ROYAL ARCHÆOLOGICAL INSTITUTE. — The annual congress of this body was opened in the Town Hall, Leamington, on Tuesday, under the presidency of Lord Leigh. Lord Leigh gave an outline of the objects of interest which they were about to inspect. The members afterwards went by train to Stratford-on-Avon to inspect the scenes of Shakespeare's infancy, education, and after life, visiting his birthplace in Henley-street, the grammar school which he attended as a boy, the Guild Chapel, in Chapel-street, the garden and site of New Place, where he lived after his retirement, the Memorial Theatre and market fountain, lately erected in his honour, and the parish church, which contains his ashes and his tomb. The opening of the antiquarian section by the Rev. J. Hirst took place at Leamington in the evening. On

Wednesday the members visited Broughton Castle, Compton Wynyates, and Adderbury; yesterday (Thursday) was devoted to Warwick Castle and Leicester's Hospital; to-day the members go to Kenilworth, Steaneleigh, Baginton, and Guy's Cliff; to-morrow to Coventry, with its noble churches; and on Monday to Baddesley Clinton, Knowle, Solihull, Meriden, and Berkswell.

COMPETITIONS.

THE ALEXANDER THOMSON MEMORIAL. — At a meeting of the trustees held in Glasgow on Wednesday, the 29th ult., Mr. David Thomson, President of the Glasgow Institute of Architects, in the chair, Mr. Wm. James Anderson, who gained the architectural travelling studentship in December last, submitted the sketches which he had made during his tour in Italy, together with a manuscript descriptive memoir. The sketches, 64 in number, with nine sheets of measured drawings, were exhibited on the walls, and carefully examined by the trustees, who felt extremely gratified with them as evidence of Mr. Anderson's diligence and industry while on his tour, and of the skill and ability which he has displayed. In the national competition at South Kensington the silver medal has just been awarded to the same drawings of Mr. Anderson, which, it will be remembered, were illustrated in the BUILDING NEWS for April 3 and 27 last, and were measured work from Queen's Park Church, Glasgow, designed by the late Alex. Thomson. The competitive drawings of two of the other candidates for the Alexander Thomson Studentship have also gained prizes at South Kensington.

DUDDINGSTON. — At a meeting of the Duddingston Local Authority, held at Portobello on Tuesday, the report of the committee appointed by the various parishes in the combination for a fever hospital was read and agreed to. It stated that the ten plans sent in had been examined by Mr. Morham, city architect, Edinburgh, and the one entitled "Efficiency with Economy" chosen on account of the very efficient internal arrangements. In it the hospital was arranged in order that more than one kind of disease could be treated at one time. The total cost would be £3,212. The architects of the successful plan are Messrs. Thornton, Shields, and Thomson, George-street, Edinburgh.

KENSAL TOWN. — The design of Messrs. Demaine and Brierley, architects, of York, has been selected for a new church and mission-hall for the newly-formed Parish of St. Thomas, Kensal Town, London. The estimated cost is £5,500. Five London architects were also invited and submitted designs.

LONDON, S.W. — Mr. Edward Francis C. Clarke, of 7, Westminster Chambers, has been chosen, in limited competition, architect for the new institute, gymnasium, concert rooms, &c., in Buckingham Palace-road.

NEW YORK. — The proposed cathedral for New York is to be the largest and costliest church structure in the United States. Designs are now being prepared for the trustees by selected American architects for the preliminary competition, but outsiders who choose may send in unframed drawings, to be delivered flat in a sealed portfolio, expressage paid, on or before December 15, 1888, directed to the Trustees of the Cathedral, See House, 29, Lafayette-place, New York City. These are to be mere sketch designs, and to consist of a ground plan in black and white, on a 1-16th scale; a front and side elevation and a longitudinal section, drawn without shading in pen and ink on above scale; and a perspective drawn with vanishing points 8in. apart, the building to be set at 45 deg. with the picture plane. This perspective to be in pen and ink without painting or shading other than black lining. All plans not accepted for the second competition will be returned to their owners. The cathedral will stand facing south, and its length will not exceed 400ft. The building must be strictly fireproof; no inflammable materials must be used. The exterior to be of marble, granite, or other durable stone; but no sandstone or porous material to be used, either in ornamentation or construction, that is exposed to the weather.

## Building Intelligence.

**DENSTONE, STAFFS.**—The memorial stone of the great hall by which the buildings of St. Chad's College, Denstone, will be completed was laid on Wednesday week. The material to be used is coursed Alton and Hollington stone, like the rest of the College buildings, with which the style will correspond, being an Early type of Gothic. The contractor is Mr. Bentley, of Waltham Abbey, who carried out the greater part of the chapel, under Mr. Garland, the clerk of the works. The designs are by Mr. R. Herbert Carpenter and Mr. B. Ingelow, of London, the College architects.

**SEACOMBE.**—The foundation-stone of the new Catholic Church of St. Joseph, which is being erected within the Presbytery grounds in Wheatland-lane, Seacombe, was laid on Friday by the Right Rev. Dr. Knight, Bishop of Shrewsbury. The church is being built from designs by Mr. Edward Kirby, 5, Cook-street, Liverpool. The style is Gothic, and the building will be seated for about 600 worshippers. The principal dimensions are: Length of nave and chancel, 120ft., to be ultimately extended to 135ft. when the porches are built; width of nave from centre to centre of columns, 29ft., and across the aisles, 53ft.; height from floor to nave ridge outside, 60ft. The external walls will be of Liscard sandstone facings, with red Runcorn stone dressings to the aisle and clerestory windows, and all the other door and window openings. The windows will be filled with lead glazing, and the ceiling will be of pitch pine, the chancel walls and roof corresponding in height to the nave. The contract for the work has been placed in the hands of Mr. John Shaw, builder, Priory-street, Birkenhead; and Mr. H. L. Whittingham has been appointed clerk of the works. The heating apparatus will be supplied by Messrs. Grundy, of Manchester. The present outlay will be £3,500.

## Engineering Notes.

**NABURN.**—Prince Albert Victor of Wales has opened the new lock at Naburn on the Ouse Navigation. It has been constructed almost parallel with the old lock, situate some six miles below York. It is 152ft. long and 26ft. wide, with depth over lower sill at spring tides of 13ft. 6in. The length of the old lock is 90ft., and it is 21ft. wide, with depth over the lower sill of 10ft. 6in. The work has cost about £10,000. The lock will be filled through a circular sluice 4ft. 9in. in diameter, worked by a cast-iron stop valve, and be emptied through four square openings in the lower gates closed by wrought-iron flaps. The river will now be available at spring tides for steamers of 400 tons carrying capacity. In addition to the construction of the new lock, other measures have been adopted to improve the navigation of the river. The shoals between Naburn and Selby are being dredged, and the Ouse Navigation Committee have ordered a new steam tug from Messrs. Heppell, of Shields, fitted with compound surface-condensing engines and twin screw. The improvements on the Ouse have prompted the traders on the river Foss to make exertions for their own special behoof, with the result that the Castle Mills lock will now be lengthened to 100ft. It will also be widened, and the channel deepened to 7½ft. of water. The new lock at Naburn has been constructed by Messrs. Nelson and Sons, of York, under the superintendence of Mr. A. F. Fowler, the resident engineer.

The sanitary committee of Bristol, by way of experiment, have had a new kind of pavement laid in Park-row, composed of cement and sand, which is expected to be more economical than the stone paving. The cost of stone in Bristol is 5s. 3d., and that of the new material 4s. per yard, but in the case of laying gas or water pipes the new style of pavement would have to be cut up, whereas in the case of the stone pavement it can be taken up and relaid.

A memorial window to the late Sir Robert Phillimore, late Dean of Arohes, has just been placed in Shiplake Church, Berkshire, depicting Moses the Lawgiver and Solomon the Just Judge.

### TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

### TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.). To India (via Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

### ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

### SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

### NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX, XL, XLI, XLIV, XLV, XLVI, XLVII, XLVIII, XLIX, L, LI, LII, and LIII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—L. and Co.—F. B. and Co.—W. B. W. and Co.

A YOUNG BEGINNER. (We are pleased to hear you derive benefit from the articles on Surveying. The subject of Levelling will be included in the series.)—SERVANT. (The examinations are held at the R.I.B.A., 9, Conduit-street. Possibly the secretary of that body will send you particulars. We have seen no official announcement for some years.)

## Correspondence.

### PRACTICAL ARCHITECTURE.

To the Editor of the BUILDING NEWS.

SIR,—You are abundantly redeeming your intention expressed a few months back to devote more space to practical matters. I hear on every side appreciation of Mr. Lovegrove's papers on Practical Architecture, and the series on Houses and Staircases, Land Surveying, and the Turkish Bath are each alike capital. I hope it is not rude to say so, but I would give up all the politics of the profession, new charters, registration, and the rest of it, and should not care if you never reported another meeting of the Institute, or the Society either, so long as you fill your space so much better. Now, a faint—well, not a grumble—a suggestion. Can't you give us more practical papers about building processes? I should like to see some practical articles written by practical workmen themselves—say on Masonry, Bricklaying, Carpentry, Plumbing, Painting, &c. The ordinary writers on these subjects do walk round their subjects so that it is impossible to follow them. Excuse my boldness—I only wish I could help you.—I am, &c.,

OLIVER TWIST.

[We wish you could, or that men of the class you mention would. They are hard to find in the building trades. It is not so elsewhere. It is pretty well known that our experience is manifold in journalism—and in other fields—in such a journal as the *English*

*Mechanic*, for instance—our best helpers come from the workmen. If encouragement is needed, we can only say we should be delighted to receive and consider really practical papers about the arts of construction and decoration from workmen.—Ed. "B.N."]

### GLOUCESTER BATHS.

SIR,—In your last issue you illustrate the selected design for these buildings, as modified for execution. The modifications have, however, resulted in leaving nothing whatever of the selected design.

The whole plan is entirely new, the idea of arrangement copied from a plan sent in by us. The elevations and sections are altogether new. In the original plan the first-class bath was placed on a different level to the second, and almost out of ground with other features of construction now entirely remodelled.

In fairness to all parties concerned in this business, Mr. Trew should ask you to illustrate his original design, which was awarded the first place.—We are, &c.,

JOHN GILES AND GOUGH,

28, Craven-street, Charing-cross, W.C.,  
London, Aug. 3.

### CHIPS.

At a vestry meeting held at Kettering on the 2nd inst. it was decided to take steps for restoring the parish church, Mr. A. W. Blomfield, A.R.A., to be the architect, and the outlay about £7,000.

The foundation-stone of new buildings about to be added to the Loughborough Chapel, Coldharbour-lane, S.W., was laid on Tuesday week. The additions comprise, on the ground floor, a new vestry 20ft. by 16ft., an infants' class-room 16ft. by 16ft., and an alteration to the present building to form a lecture-room 36ft. by 21ft. On the first floor the present school-room will be enlarged, providing a hall 62ft. by 36ft. The elevations will be built in gault brick, with stone dressings. The architects are Messrs. Habershon and Fawcner, of Bloomsbury-square, and the builders are Messrs. T. Gregory and Co., of Station Works, Clapham Junction. The works will cost £1,000.

Mr. E. H. Shorland, of Manchester and London, has recently supplied his patent Manchester grates to the new Board schools, Castle-hill, Edinburgh. This makes the fifth school this year for the Edinburgh School Board which has been warmed and ventilated by means of Shorland's patent Manchester grates.

The fever hospital at Stockport is being extended from plans by Mr. A. M. Fowler, the borough surveyor. Mr. Bateson, of Stockport, is the contractor.

Providence Chapel, Snodland, near Rochester, having been acquired by the trustees of the adjoining British schools for extension purposes, a new chapel is being built on another site, Mr. Wilfrid, of Rochester, being the contractor. The foundation stone was laid on the 1st inst.

The Tamworth town council has adopted plans prepared by Mr. Joyce, of Stafford, for the proposed municipal buildings.

The foundation stone of the new post and telegraph office at Inverness was laid on Friday by Sir H. C. Macandrew. The new post office, which is being erected from designs by Mr. Robertson, of Her Majesty's Board of Works, Edinburgh, will cost about £12,000.

Sir John Lubbock has bought the estate of Kirkstall, near Leeds, which includes the ruins of Kirkstall Abbey.

The two stained-glass windows given to the West Church, Stirling, by Mr. William Connal, of Solsgirth, were unveiled on Friday. The windows were erected by Messrs. W. and J. J. Kier, Glasgow.

At a meeting of the Oldbury Local Board on Friday a discussion took place on the propriety of erecting public buildings for the town, and the matter was referred to a committee of the whole board to consider the subject and report as to the question of cost. The town has just decided to adopt the Free Libraries Act.

Mr. E. B. Hearne, C.E., late assistant to Mr. J. L. D. Meares, town surveyor of Newry, has been appointed resident engineer of the Belfast Main Drainage Works. The works cannot be accomplished under four years, and the cost will be about £300,000.

On Saturday afternoon six memorial stones of the new Wesleyan Sunday schools were laid at Gee Cross, Hyde. The estimated cost of the building is £1,370; and the architect is Mr. G. Gill, of Ashton-under-Lyne.

## Intercommunication.

### QUESTIONS.

[9703].—**Practical Architecture, with Detailed Estimates.**—In the BUILDING NEWS of August 3rd, under the foregoing title, it states in the Mason's Specification, in describing "Dressings," that the "arches," "jambs," and "columns" of porch "to be of red Dorsetshire stone of the best quality, and laid upon its natural quarry bed." Would it not have been safer to have specified the stone to be laid [where—(or) when] practicable on its natural bed, as I scarcely think the foregoing could be laid as stated—at any rate, not with Dorsetshire stone in the district I am of. In paragraph 46 it describes "All top steps and thresholds" to be, &c. Does not the latter term cover the former? Clause 41 says, "All work exposed to injury to be properly cased up and cleaned down at completion," by which I understand that only the work liable to be damaged is to be cleaned. Would it not have been better somewhat as follows?—"All work exposed, or liable to injury, to be properly protected, or cased [up—off], and the [works generally—] who's works [where required—where necessary—(or) as directed] to be cleaned and pared at completion, or just prior to the contractor handing over the building for occupation."—TOLOP.

[9704].—**The Employers' Liability Bill.**—Having read your article on this subject in the BUILDING NEWS, page 97, I beg to ask your opinion as to who will be legally liable, under the new Bill, in the following case:—I have a brickyard; I find the machinery and pay for keeping it in repair. My brickmaker contracts to make at a price per thousand; he finds all the men and lads; he engages and dismisses them without consulting me; he agrees with them about wages; one of his men attends to the engine and boiler and machinery under his orders; he finds fuel. I may be absent from the yard for days or weeks; I instruct him to get the machinery protected at my cost always promptly. Secondly, can you recommend any printed form to be put up in the yard on this subject? If so, please give a sketch of such form.—Z.

[9705].—**Lightning Conductors.**—Will some reader be good enough to state the usual rule for measuring lightning conductors when a price per foot lin. is accepted, which has to include the copper plate in ground, and also the spiked rod at end? Should the two latter be measured as tape?—VIRGINIUS.

[9706].—**Honours Exam. in Building Construction.**—Would someone who has studied for the above examination kindly inform me as to what book on strains, formulae, &c., is necessary to pass the exam. without going into difficult mathematical calculations?—VERITAS.

[9707].—**Architect's Liability.**—A. designed and superintended the erection of a warehouse for B., the packing room being on the ground floor. After a period of three years dry rot is discovered in the floor of packing room, which was constructed in the usual manner, that is, having red deal joists and pugging, the ground being sunk underneath to a depth of 18in. or 2ft., and ventilated by means of 9in. by 5in. air bricks about 9ft. apart. I should add the air bricks on the one side have small conical holes in them, and on the other bar openings.—BOAZ.

[9708].—**Heating Apparatus.**—Can anyone advise me about the best and cheapest system of hot-air apparatus for warming an old house with cellars beneath, where the fire can be placed? Is it practicable to build the whole arrangement in brick and distribute the warmed air in wooden pipes? If it is better to buy a cast-iron stove for warming the air, whose stove is best? I want to heat three rooms 18ft. by 25ft., and a hall 18ft. by 18ft., with a uniformly heated supply of warm fresh air.—F. D.

[9709].—**Belgium.**—Can any correspondent suggest to me a short trip in Belgium, and give particulars as to cost during a ten days' trip?—IOTA.

[9710].—**Sculptor's Wax.**—I would be glad if any reader would give me a receipt for making sculptor's modelling wax, with the exact proportions of the ingredients. An early reply will greatly oblige.—C. L. H., Dublin.

[9711].—**Maps and Plans of Old London.**—Some time back I recollect an exhibition being held (I think at South Kensington) of old maps and plans, showing the development of London and its suburbs. Could any of your numerous readers give me any particulars of same, or any information as to where maps, &c., could be seen, especially dated about 1800?—OLD LONDON.

### REPLIES.

[9698].—**Surveying Instruments.**—It is not absolutely necessary that a surveyor in a small country practice should have a theodolite. But really a good second-hand one may be bought so cheap nowadays that it seems hardly worth while to be without so valuable an adjunct to the equipment of a surveyor. As a saver of time and as an assurance of accuracy, if for surveying only, the theodolite is a great boon; but for inaccessible distances and heights, for setting out curves, &c., it is simply indispensable. I am not one of those who advocate using the theodolite as a level, although in an emergency I have done so. In the absence of a theodolite, a "box-sextant" is an exceedingly serviceable instrument for taking angles, or a prismatic compass, the latter requiring great care in use, especially to avoid metallic attraction. For ordinary practice a good 12in. dumpy level (with compasses attached), staff poles, and ranging rods, 100ft. and 66ft. chains, optical square (not cross-staff), a good plumb-bob, beam compass, circular protractor, and steel straight edge, are the chief desiderata.—GEORGE WM. USILL, A.M.I.C.E., Editor of Merritt's "Land and Engineering Surveying."

St. James's Church, Taxal, has been closed for alterations and improvements to be effected in its interior, from the plans of Mr. Darbyshire, architect, of Manchester, at a cost of £1,000.

### LEGAL INTELLIGENCE.

KAYE AND OTHERS V. CHUBB AND SON'S SAFE AND LOCK COMPANY (LIMITED).—(Before the Lord Chancellor, Lord Watson, Lord FitzGerald, and Lord Macnaghten).—This was an appeal from a decision of the Court of Appeal reversing a judgment of the Queen's Bench Division in an action brought by the appellants against the respondents for the alleged infringement of a patent apparatus for fastening and unfastening doors, gates, lids, and windows. The appellants' and the respondents' door-latches are all made on what is known as the "push and pull" principle—that is to say, the latch is withdrawn from the doorpost, not by turning the door-handle round, but by pulling the inside handle or pushing the outside one. At the trial in November, 1886, Mr. Justice Mathew gave judgment for the appellants; but his decision was reversed by the Court of Appeal, who ordered judgment to be entered for the respondents. At the hearing of the appeal, judgment was postponed. Their Lordships on Tuesday gave judgment, being of opinion that the appellants' invention was valid. Judgment reversed with costs.

PILASTERS AND THE BUILDING ACT.—At Hampstead, Edmund Toms, builder, of Gloucester Works, Wellington-street, Camden-town, has appeared in answer to an adjourned summons taken out by the Hampstead Vestry charging him with having, without the consent in writing of the Metropolitan Board of Works, erected certain structures in advance of the general line of frontage in Church-row and Heath-street. For the defence it was contended that the pilasters came under the description of "window dressings and other like architectural decorations," and that, therefore, the defendant was justified in what he had done. It was also said that this view had been upheld by Mr. Barstow in a similar case at Clerkenwell Police-court, which was now awaiting decision on appeal. The Bench ordered the demolition within six weeks of so much of the building or structure on the Heath-street side as was more than 5½in. in advance of the front wall of the building, and of so much on the Church-row side as was more than 3½in. in advance of the front wall. They also ordered the defendant to pay 20 guineas costs.

CASE UNDER THE EMPLOYERS' LIABILITY ACT.—At the Chester County Court, on Friday, before Judge Horatio Lloyd, judgment was given in a case in which a labourer named Pearson, living in Hoole, Chester, sought to recover £200 from Robert Neill and Sons, builders and contractors. The defendants were the contractors for the erection of a goods station at Chester, and the plaintiff was employed by them. For the purposes of laying foundations, holes had to be dug, and into these holes planks had to be driven. The plaintiff was engaged in one of these holes preparing for the planks, and on the occasion in question he gave the signal to "strike." The man above struck, and in so doing caught a heavy wooden dolly, which fell on the head of the plaintiff, causing serious injuries.—Judgment was given for plaintiff for £70; execution to be stayed for two months if defendants paid the plaintiff £10.

MEMBERS OF LOCAL AUTHORITIES AS CONTRACTORS.—At the Yorkshire Assizes on Saturday, before Mr. Justice A. L. Smith, the case of Nutton v. Wilson was heard. The plaintiff in this action was John Nutton, an excavator and contractor, of Church-street, Elland, and he sued to recover £50 as penalties from the defendant, Joseph Wilson, a joiner and carpenter, of Elland, and a member of the Elland local board, in consequence of the latter having participated in the profits of certain contracts between the board and other persons. The case for the plaintiff was that in September, 1887, and October, 1886, the Elland local board accepted tenders for certain work from two men named Brook and Holdsworth, and that the defendant was employed by Brook and Holdsworth, receiving payment from them in respect of his work, notwithstanding that he was a member of the local board. His Lordship gave judgment for the plaintiff for £50 and costs. Stay of execution was granted, and his Lordship directed judgment to be given for the defendant, with costs, provided Wilson succeeded on appeal.

The purchase and preservation of the Clissold Park is practically secured. This park, in Stoke Newington, covers 53 acres. Towards the purchase fund the Hackney Vestry has voted £5,000 and the Islington Vestry £2,500, while the Ecclesiastical Commissioners have sold the property for £10,000, or £12,000 less than its estimated value as a building site.

The Church of St. Paul, Royton, near Ilminster, is about to be restored at a cost of £5,000. A faculty has been granted to enable the committee to take down the present nave of the church and build a new nave, aisles, vestries, and side chapel.

### PARLIAMENTARY NOTES.

THE NEW POLICE OFFICES ON THE EMBANKMENT.—Mr. Broadhurst asked the Secretary to the Home Department whether the contract for the building for the new police offices on the Embankment had been yet let; and, if so, to whom; and whether the granite and stonework for the building was being prepared by the convicts at Dartmoor and Portland respectively; and, if so, whether that work was done for the Government, or whether the convict labour was hired by contractors, and, if the latter, by what contractors. Mr. Matthews: The contract for this building has been let to Messrs. Grover and Sons. The granite required for the lower portion of the building has been worked by convict labour at Dartmoor. The work is done for the Government, and the Receiver of Police pays all expenses incurred, including delivery on the ground. The contract was concluded on the understanding that all the granite would be delivered free of cost, and the contractor derives no benefit therefrom.

### WATER SUPPLY AND SANITARY MATTERS.

CROYDON.—The new reservoir was inaugurated last week. The water is obtained from a well situate three-quarters of a mile south of Addington village. It is sunk in the chalk to a depth of 200ft., the surface being 318ft. above sea-level. The storage capacity of the headings and the lower part of the well is about 502,000 gallons. A Woolf compound beam-engine raises the water, its delivering power being 77,760 gallons per hour. The reservoir will hold 5,000,000 gallons. Its overflow level is 465ft. above sea-level. The total length of mains laid is about 13½ miles. The district for domestic supply is the area of the borough within a two-mile radius from the town-hall, with about 75,000 people. The works have been carried out under the direction of Mr. T. Walker, borough engineer.

EALING, W.—The ceremony of christening the new storage reservoir of the Grand Junction Waterworks at Ealing took place on Friday. The new reservoir is situated on Mount Park-hill, and will be a reserve to meet any emergency caused by excessive drought, large fires, or other contingencies. Its surface extends over six acres, and, with a depth of 45ft., it will contain 51,000,000 gallons of filtered water. It is lined with Portland cement concrete, and the slopes are paved with vitrified brick. The level of top water is 193½ft. above Ordnance datum, and the water will be supplied from the works at Kew-bridge through a line of pipes 30in. in diameter. Messrs. John Aird and Sons were the contractors, and Mr. A. Fraser was the engineer.

ST. HELENS, LANCs.—The foundation stone of new engine and boiler house for the St. Helens Corporation waterworks was laid on Tuesday week at Kirkby, on the Sefton estate. The two wells close by have been sunk in the pebble beds of the New Red Sandstone formation by Mr. Villiers, contractor, of Beverley. Each is 11ft. in diameter and 150ft. deep, being connected by a heading 9ft. by 6ft., and a borehole sunk at the bottom of one of the wells makes a total depth of 510ft. Messrs. R. Daglish and Co., St. Helens, will supply the pumping engine at a cost of £5,990, and Mr. William Harrison, St. Helens, has put in the engine foundations and boiler seatings at a cost of £1,718. The engine house will take the form of an octagonal castellated tower, rising 80ft. above the ground line, and 48ft. wide each way, with chimney, also octagonal, rising 30ft. higher. The base will be surrounded by a terrace 12ft. high. The structure will be built of stone and brick, the outside being of coursed rubble stones. The boiler house will correspond in style. Messrs. J. and T. Yearsley, St. Helens, have this portion of the work in hand, their tender being £5,880. The whole of the works are being carried out from designs and specifications by Mr. D. M. F. Gaskin, borough water engineer, at a cost of £18,500.

At Outwood, near Wakefield, on Friday, the new south aisle and Gammell Chapel of St. Mary Magdalene, Outwood, was dedicated by the Bishop of Wakefield. The cost of the additions to the church has been £1,600 (including £250 for the chapel). Accommodation is now provided for 600 worshippers, as against 400 before. Mr. J. T. Micklethwaite, F.S.A., Westminster, prepared the designs, and these have been carried out by Mr. John Binks, a local builder.

On Friday Mr. Terry, Local Government Board Inspector, held an inquiry at Deal relative to the application by the town council for permission to borrow £4,000 for the construction of a sea wall at North Deal, and other town improvements. The town clerk supported the application on behalf of the council, and Mr. Worsfold Mowll opposed it, representing the rector and other ratepayers.

## Our Office Table.

THE first report of the committee appointed to investigate the action of light upon water-colours, has just been published as a "Blue-book," and deals with the physical aspect of the inquiry. Practically, the committee find that while many pigments used by the water-colour artists do fade under exposure to light, "a good gamut" of safe colours is still available for use, while the important fact is established that every pigment is permanent when exposed to light *in vacuo*, indicating the direction in which experiments should be made for the preservation of water-colour drawings. The committee find that mineral colours are more stable than vegetable colours; that if moisture and oxygen are excluded from a picture it will not deteriorate from the action of light; and that what destroys a water-colour are the blue and violet rays of the prism. It would take a century in South Kensington very markedly to deteriorate a water-colour. If the sun's rays were excluded and only gas or the electric light used, it would take thousands of years to harm the pictures. And if a yellow glaze were interposed between the sunlight and the picture the risk of fading would be greatly lessened. The most fleeting colours are carmine, crimson lake, purple madder, scarlet lake, Payne's grey, Naples yellow, olive green, indigo, and brown madder. The colours which stand are yellow ochre, Indian red, Venetian red, burnt sienna, chrome red, lemon yellow, raw sienna, terra verte, chromium oxide, Prussian blue, cobalt, French blue, and ultramarine ash. Prussian blue has a peculiar quality. It fades into green after exposure to strong light, but is restored by being placed for a time in the dark.

SIR ROBERT RAWLINSON makes in Wednesday's *Times* another protest against the precipitation and deodorisation works now being carried out by the Metropolitan Board of Works at the sewage outfalls. He remarks that many years since the members of the Board were informed by the most eminent chemists that no chemicals purified sewage; that the best left seven-eighths of the salts of sewage in the clarified water, *plus* some of the chemicals; and that the clarified fluid, when passed into small streams or rivers, would ferment, become putrid and offensive—these being the results, whatever chemicals or precipitants were used. He predicts that the fifty cases of sewage tanks and works will prove intolerable, that the river barges will be costly incumbrances to the river, and that the working expenses will be enormous, and all waste. Sir Robert reiterates his well-known views that in broad irrigation will be found the solution of the problem of dealing with the metropolitan sewage.

In their thirty-first annual report, just issued, the Trustees of the National Portrait Gallery state that three portraits were purchased during the year, those of Lieut.-General Sir James Hope Grant, 1806-1876, by Sir Francis Grant, P.R.A.; Mrs. Sarah Trimmer, 1741-1810, educational writer, painted by Henry Howard, R.A.; and Admiral Sir Cloudesley Shovel, 1650-1707, painted by Michael Dahl. The purchases made now reach a total of 420 since the collection was formed. An important alteration of name in one of the principal pictures has recently been made. A portrait, formerly in the possession of Mr. Fraser Tytler, and described as a portrait of Mary Queen of Scots, has been found to be a portrait of her mother, Mary of Lorraine. The manner in which the arms of France and Scotland are quartered clearly indicate the date, 1560, when Francis II. and Mary ruled in France, and Mary of Lorraine was Regent of Scotland. The picture would appear to have been painted whilst the Regent was besieged in Leith, and the distant city and castle among rocks would be intended for Edinburgh. Another picture, presented in May, 1877, as a portrait of Sir Randolph Crewe, has since been proved to represent Sir John Bramston, an eminent Judge, painted by Daniel Mytens. Several pictures have been cleaned and lined, others have been cleaned, and seven portraits have been put under glass.

At the last meeting of the Stockport town council a heated discussion took place with

reference to the receipts and duties of the borough surveyor, Mr. A. M. Fowler. Mr. Williamson, who raised the question by a resolution, said that Mr. Fowler was appointed in 1884 at a fixed salary of £100 a year and a commission of 5 per cent. on extra works. This commission had amounted during the past two years to £838. Inconvenience had arisen from the fact that Mr. Fowler was allowed to continue private practice at Manchester, and he urged that it would be more economical and satisfactory to employ the whole time of the borough surveyor, and pay him an inclusive salary. Col. McClure pointed out that Mr. Fowler's charges were less than those of an outside architect or engineer, and eventually the whole subject of the borough surveyorship was referred to the committee with instructions to report back to the council.

THE system of registration of plumbers instituted by the Worshipful Company of Plumbers, London, has just been introduced into Manchester through the instrumentality of the Manchester and Salford Sanitary Association, and is now fully organised. The local council, of which Mr. John Holden, F.R.I.B.A., is chairman, and Mr. Fred Scott, secretary, consists of representatives in equal numbers of the public, master plumbers, and operative plumbers. The representatives of the public, appointed at a public meeting in the Town Hall, include the Mayors of Manchester and Salford, the chairmen of the Health Committees, city and borough engineers, medical officers of health, the chairman and secretary of the Sanitary Association, architects, builders, and sanitary engineers. The masters and operatives also in public meeting selected their own representatives. The council will carry out the work of registration in Manchester and Salford and a district of about 30 miles radius, except on the Liverpool side, where the district will extend only to Warrington. At the last meeting of the local council the first batch of applications were passed for nomination in the Plumbers' Company.

In an interim report just issued the Select Committee on Town Holdings explain that it is not in their power to complete the whole of their inquiry this season. They add:—"Your committee hope that it may not be necessary for them to call further witnesses as to the terms of occupation and the compensation for improvements possessed by the occupiers of town houses and holdings in Great Britain and Ireland, or as to the expediency of giving to leaseholders facilities for the purchase of the fee simple of their property; but they desire to take further evidence upon the question of imposing a direct assessment on the owners of ground-rents, and on the owners of increased values imparted to land by building operations or other improvements. They accordingly recommend that the committee be re-appointed next Session for the purpose of receiving such additional evidence as they may think necessary, and also of reporting upon the several branches of the inquiry."

### CHIPS.

A block of buildings just erected at Carnforth for the Co-operative Society were opened on Saturday last. The block consists of a public hall, capable of accommodating between 500 and 600, with a gallery, ante-room, two-stalled stable, cart-house, three-storied warehouse, and three large shops, in which the grocery, provision, drapery, and boot and shoe trade will be carried on. The hall is the largest public room in the town. Mr. Robert Walker, M.S.A., of Windermere, was the architect, and the cost has been £2,500.

Building operations have just been commenced for the new schools adjoining the church erected at Monton Green, near Manchester, some years since. The building will be faced with stone parpoints and Darleydale ashlar, and will contain large school and classrooms on ground floor, with meeting-room 64ft. by 32ft. on first floor, and social rooms for the use of the congregation. The architects are Messrs. Thos. Worthington and J. G. Elgood, Lombard-chambers, 46, Brown-street, Manchester; and Messrs. Southern and Sons, the general contractors.

Alterations have been made at the Castlegate Ward Liberal Club, York, embracing the ventilation, which is now carried out on the Boyle system, the latest improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

## MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Clerks of Works Association. Paper by T. Gamage, Carpenters' Hall, E.C. 3 p.m.

## Trade News.

### WAGES MOVEMENTS.

DUNDEE.—At a meeting of joiners held in Dundee on Friday night the wages question was discussed, and a resolution was unanimously adopted declaring that the present state of the joiner trade in Dundee warrants an advance on the rate of wages, and that the meeting was of opinion that an immediate demand be made for a rise of 3d. per hour to all men who are paid under 63d., and that all others be raised to the standard of 7d.

A new reading-room has just been added to the Free Library at Chester, at the sole cost of the mayor of that city. Mr. Thomas M. Lockwood, of Chester, was the architect. The public opening took place on Friday.

At Friday's meeting of the Metropolitan Board of Works, a memorial from the vestry of St. Nicholas, Deptford, praying the Board to provide a small class of dwellings for the working classes of Deptford instead of the great blocks of labourers' dwellings now being erected under the Artisans' Dwellings Act, was presented by deputation, and was referred to the Works and General Purposes Committee.

A statue of Earl Shaftesbury has been completed by Mr. J. E. Boehm, R.A., at a cost to the donors of £2,000, for erection in Westminster Abbey, but remains at present in the sculptor's studio until additional subscriptions have been raised to meet the fees demanded by the Dean and Chapter. £400 was originally claimed on this account, but this was reduced on the representation of the committee to £250. It is satisfactory to learn that this fee will not go to the clergy, but be carried to the fund for the repair of the Abbey fabric. In addition to the statue, the committee have commissioned Mr. Alfred Gilbert, A.R.A., to execute a memorial in bronze to be erected in Shaftesbury-avenue or Piccadilly-circus.

The work of restoration of the priory church of Old Malton is proceeding under the direction of Mr. Temple Moore, F.S.A. About ten years ago the lay rector, Earl Fitzwilliam, spent £3,000 on the restoration of the tower and south walls, and the present works are being carried out by a committee of subscribers.

**Holloway's Pills.**—In weakness of the stomach, in diseases of the liver, and in disorders of the system caused by cold or sluggish circulation, no medicine is so efficacious as these Pills. By quickening digestion they give refreshing sleep, impart tone to the digestive organs, purify the blood, and strengthen the whole physical frame.

**Garside's Noted Bedfordshire Coarse and FINE SILVER SAND.**—Is perfectly free from impurity, and the best and cheapest in the market. All qualities in stock, for every purpose required in the building trade, for filtration, or for nursery purposes. All pure grit!—Apply to GEORGE GARSIDE, Junr., Leighton Buzzard.

## DOULTING FREESTONE.

**THE CHELYNCH STONE.**—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

**THE BRAMBLEDITCH STONE** is of the same crystalline nature as the Chelynych Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

## HAM HILL STONE.

Greater facilities have been provided for working these Quarries, and the Stone can be supplied in large quantities at short notice. Prices and every information given on application to

**THE HAM HILL STONE CO.,**  
NORTON, STOKER-UNDER-HAM, SOMERSET.

Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

**HYATT'S LENS and "SEMI-PRISM"**  
LIGHTS for PAYMENTS, STALLBOARDS, ROOFS, &c.  
TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringden-road, London, E.C.

MAHOGANY, WAINSCOT, WALNUT,  
TEAK, VENEER, and FANCYWOOD  
MERCHANTS,

120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

# THE BUILDING NEWS AND ENGINEERING JOURNAL.

VOL. LV.—No. 1754.

FRIDAY, AUGUST 17, 1888.

## THE LIABILITY OF THE QUANTITY SURVEYOR TO THE CONTRACTOR.

THE very important case of "Priestley and Gurney v. Stone" has now been decided in the Court of Appeal, as we reported (August 3), and the judgment of Mr. Justice Stephen, upon which we commented at the time (January 27), has been unanimously affirmed. So far, then, the law is settled, for though, of course, there may be an appeal to the House of Lords, we much doubt whether that body could be induced to vary the view taken by the Court of Appeal in their application of well-known legal principles to the facts of this case. We still maintain that the decision is not in accordance with custom or with common sense. But as the law stands, it becomes a question whether it would not be better for contractors and others so to alter their custom as to bring the pressure of legal liability to bear upon negligent quantity surveyors. It will be well worth while for us to recapitulate the facts of this case before dealing with the legal points and arguments involved, and before drawing from the whole that moral which we think it teaches.

The action was brought by the plaintiffs, builders, against the defendant, a quantity surveyor. A Catholic priest being about to build a church at Chiswick employed one Kelly, an architect, to draw plans for the purpose. Kelly did his part of the work, and then instructed the defendant, a quantity surveyor, to take out the quantities according to his plans. The defendant accordingly prepared a bill of quantities, had a number of copies photographed and handed them to Kelly, who thereupon applied for tenders. The plaintiffs, amongst others, tendered for the building, and their tender was accepted. The plaintiffs paid the usual fee on obtaining the quantities at the architect's office, and it was understood, as usual, that the successful builder should pay the surveyor's commission out of the first instalment due under the contract. This was quite according to the regular course of such transactions, and this it is which makes the case of such wide-spread interest and importance. The plaintiffs soon found that the quantities were very deficient, and they refused to pay the defendant the price of his commission unless he undertook to make good these deficiencies, and on his refusal they brought this action. The plaintiffs claimed damages for injury caused by the negligence and breach of duty of the defendant as quantity surveyor in preparing an inaccurate bill of quantities. They based their claim upon the grounds that the defendant, in preparing the bill of quantities, represented that the same was correct, and would be sufficient for the building of the church according to the plans; and, further, that it was the duty of the defendant, as such surveyor, to use ordinary care and skill in the preparation of the quantities, knowing that tenders were made and contracts entered into on the faith of their accuracy. In his defence the defendant denied that he was negligent, and said that there was no privity of contract between him and the plaintiffs, and that he did not owe any duty to the plaintiffs. He further maintained that there was any inaccuracy in the quantities, and alleged that the plans were altered after the quantities had been prepared, and he also counter-claimed the price of his commission. At the trial Mr. Justice Stephen, judgment was given for the defendant in the action, and

upon his counter-claim and upon appeal the Master of the Rolls and Lords Justices Lindley and Bowen—a very strong Court—agreed in confirming this decision. The argument for the plaintiffs was, in effect, that they had made their tender in good faith, relying upon the implied representation in the defendant's bill of quantities that they were accurate, whereas they were inaccurate through his negligence, and so he should be liable in damages for misleading them and causing them to suffer loss. Plaintiffs' counsel referred to "Scrivener v. Pask" in support of his contention; but that decision only proved that the building owner could not be made liable for inaccurate quantities, even when his own architect prepared them. It is true that, in his judgment upon that case, Mr. Justice Blackburn said, "If there has been misconduct on the part of the quantity surveyor, the plaintiffs have their remedy against him." But the point of this observation in its legal aspect lies in the word "misconduct." Undoubtedly, if there had been any fraud or fraudulent misrepresentation, or if there had been such recklessness as amounted to that, then there would have been "misconduct" in this sense—and, as Lord Justice Bowen intimated, the defendant might have been liable. However, the plaintiff's claim was not based upon fraud of any kind, but only upon the defendant's negligence in doing his work, so that it could only be founded either upon a breach of contract or a breach of duty on his part. The result of the judgment upon appeal is to hold that there is no contract between a quantity surveyor and a contractor, and that the former owes no duty to the latter, so that the only two bases upon which the plaintiffs' claim could be built up were taken away. The case of "Scrivener v. Pask" decided that the builder has no remedy against the owner for defective quantities: the case under comment now declares that he has no right of action against the surveyor; and thus, as the law stands, builders have no redress anywhere for loss upon deficient quantities, and they must, as far as the law goes, accept tenders at their peril, unless some change is made in the existing methods of doing business.

The judgments in the Courts of Appeal are, from a legal aspect, hard to answer. The Master of the Rolls laid it down that the contract as to taking out the quantities was made between the architect and the surveyor, and not with the builders. The surveyor was employed only and solely by the architect, and dealt with no one else. He handed in his quantities to the architect, who could check them, or alter them, or alter his own plans before sending them to the builders. If there were any such alteration it would be hard to make the surveyor liable to builders for any loss they might incur. Lord Justice Lindley based his judgment upon the absence of any "privity of contract" between builders and quantity surveyors; but this phrase, "privity of contract," is a legal theory much broken in upon lately. The real question at issue was only dealt with at once boldly and broadly by Lord Justice Bowen. In his view there was no privity of contract between plaintiff and defendant, and no duty owing from the defendant to the plaintiff, upon which any legal liability could be founded. The best point in the plaintiff's case was that the defendant made a statement as to quantities, which he knew would be passed on to other persons, and as he was liable for that statement being inaccurate. But he only made that statement upon his own belief, and he either believed, or did not believe, in the truth. If he did, then there could be no liability; and if he did not, then it was fraudulent, and he could be held responsible if sued in an action grounded on this fraud.

According to Lord Justice Bowen, a quantity surveyor is bound to use care about his work; but he makes no representation that he has used such care upon which he could be made liable to parties with whom he has no sort of contract. Even assuming the defendant was negligent, that would not render him responsible to the plaintiffs, as builders, unless the negligence was so reckless as to amount to fraudulent misrepresentation, of which there was no evidence, and which had not been set out as the plaintiffs' ground of action for damages.

The Court of Appeal have, therefore, now decided that there is no privity of contract between a quantity surveyor (employed by the architect of a building) and a builder tendering for the construction of the building, so as to enable the builder to sue the surveyor for negligence or breach of contract in preparing inaccurate bills of quantities. They have further decided that the relation of quantity surveyor to builder does not imply that the former owes any such duty to the latter in preparing a bill of quantities as would bring about the same liability for damages that would flow from privity of contract between them. The second point is the more important, for it could not be contended that there was any privity of contract based upon what is generally understood by a contract; but there is much to be said in support of the argument that a surveyor who prepares quantities owes a duty to every builder who may *bonâ fide* tender upon the faith of their being accurate. The Court of Appeal have, however, decided that there is no such duty, and they have absolved the surveyor from all liability to builders who may lose by his negligence and inaccuracy as to quantities, unless these can be shown to be so gross and reckless as to become fraudulent in the eye of the law. To prove that would be practically impossible, and so the question arises whether a legal liability cannot be obtained by such a modification in the existing method of doing business as may insure privity of contract amongst all parties.

The shortest and the simplest way to bring about this desirable result is to incorporate the quantities, by reference or otherwise, in the contract made between owner and builder. If this were done all parties concerned would be liable one to another, and reasonable accuracy would be pretty well certain of being employed. Presuming a contract to cover the quantities, the building owner would in law make himself liable for any loss to the builder arising from their deficiency. If such a loss occurred, he would in his turn look to his architect to be protected, who in his turn would come down upon the quantity surveyor whom he had employed for compensation. As between architect and surveyor, there would be a clear contract, upon which the latter would be liable for any inaccuracy in doing the work which he was engaged to perform. The architect would be equally clearly liable to the building owner, and on the contract for the actual building the owner would become responsible to the builder for the accuracy of the quantities therein referred to or contained. In this way owners would take care to employ architects who could be trusted to engage competent quantity surveyors, and so the chain of legal liability would be strongly made up of the several well-defined links of mutual and contractual liability between the various parties engaged in the transaction, and there would be no need to base claims for damages upon inferential arguments as to duties owing from one to another. It would have been better and more in accordance with the custom of the profession if the Court had adopted the view that the quantity surveyor practically contracts with the builder, from whom he receives his commission, that his bill of quantities is fairly accurate, and is not, at all events, misleading when used as the

basis of a tender. But as the courts of law will not accept this short cut to the liability of quantity surveyors, and as they must, in the interest of everyone, be made liable for bad work somehow or other, it seems obvious that the only remedy lies in the roundabout method above described. Make the bill of quantities a part of the contract between owner and builder, and then the rights and remedies of all parties will flow naturally from their legal relations between each other.

[After the above was in type we received the letter from one of the learned counsel in the case which will be found in another column. That communication confirms all that we have said, and supports our view that the best and most logical remedy lies in making quantities a part of the building contract; while it also contains another suggestion for the creation of a new contract between builder and quantity surveyor which would do, perhaps, as well, but is not so likely to be adopted, we consider.]

### HALLS AND STAIRCASES.—III.

**B**EFORE proceeding to suggest other arrangements of halls and staircases, it is necessary to say something of planning winding stairs, now so commonly introduced for saving space. Architects, when they draw in their stairs, seldom take the trouble to equalise the width of the treads as much as possible along a given "tread-line," or distance from the handrail, a line which is generally assumed to be about 18 in. from the handrail. Unless this line of travel is taken as the setting-out line for the risers, the treads will be of a different width on the winders to those of the straight flight, causing persons to stumble going up or down stairs. The error is in making the risers of the straight flight terminate at the springing of cylinders, the result of which is that the treads of winders are unduly narrowed just where the feet travel in ascending or descending. By confining the winders to the quarter circle the transition from the flyers to the winders becomes abrupt. To obviate this, two or more of the flyers should be made winders, so as to graduate their width. For the sake of convenience, also, it is necessary to increase the width of the stairs at the winders a few inches, by which a very considerable degree of ease is secured at the turnings, admitting of the readier removal of furniture. Let us take a one-quarter space winding staircase, such as is often seen in small dwellings (Fig. 1). The walls of staircase are set out first, determined by the number of risers. We assume a 3 ft.-wide staircase with 10 in. cylinders and, allowing a 3 ft. passage-way, the total width between walls may be taken at 7 ft. Drawing in the tread-line and the starting and landing risers, the other risers are divided between them with an equal width of tread, the division being made to give equal spaces round the cylinders as shown in our plan, observing particularly that the width of tread at the line of travel round the cylinders corresponds with that in the straight part of the flight. Nothing is more important than the grading of winders round the cylinder, both for easy ascent as well as to give an agreeable curve to the wreath of handrail and string, and to avoid a sudden ungraceful twist. We do not, however, recommend this plan as a model; a quarter landing is infinitely preferable, and it may be obtained by a few extra inches in the "going" of the stairs. Sometimes by curving the risers into the cylinder winders may be avoided, and a reduced quarter-landing obtained when the cylinder is small. The starting or commencement of a flight is one other point of vital importance in the design of a flight. Nothing looks meaner or less inviting than a long, narrow flight commencing with straight steps and a small curtain or scroll at the bottom. A more

elegant and inviting arrangement is to curve the risers of the first three or four steps, as shown in Fig. 2. This plan is especially convenient when the space at the foot of stairs is contracted. More attention to these points in the planning of stairs will frequently be the means of saving valuable space, and in conducting to a comfortable staircase. We may be told these suggestions are not in accordance with Old English models. Perhaps they are not. The conditions of modern staircase planning are not the same. Space has now to be saved; beyond which the Old English model does not agree with the spirit of Classical architecture, or the adaptation of modern scientific stair planning to artistic design. Architecture in these matters ought

Fig 1

Fig 2

to be the outgrowth of advanced science and artistic discernment, and until it attains to that position it falls short of its true meaning.

We must again caution the student against fitting a stair to a given space, as if any tread and riser can go together. Anyone who has ascended a flight in which the grade is not in accordance with the formula we have given (page 66) must have experienced a sense of fatigue and exertion. For instance, a staircase with steps having a 9 in. tread and a  $7\frac{3}{4}$  in. rise is awkward, the riser being  $\frac{1}{2}$  in. more than it ought to be by Blondel's rule. The ordinary plan is to divide the height of story—from floor to floor level—into any number of parts that can be got within the length of flight; the latter length, or "going," as it is called, deducting landing, is next divided into treads, the number of which is always one less than the number of risers in the flight. The proper and scientific method is, as we have pointed out, to adopt an easy step-proportion of rise to tread, and adjust the walls to the length of run.

Continuous flights ought to be limited to twelve or fifteen steps, the shorter the better, and a width of 3 ft. is the least for two persons passing. A width of 4 ft. is sufficient for a house of moderate pretensions. For public buildings, staircases of 5 ft., 8 ft., and 10 ft. are necessary. The plans we now give show the side hall and staircase suitable for residences of a superior class; in the two first plans the hall is made an important feature, well lighted by windows in front at the side. Plan 8 exhibits an arrangement of house in which the principal reception rooms are placed towards the south-east, and the hall and entrance in the opposite or north-west front—a distribution of plan that gives a very desirable location of rooms and offices in this climate. Architects frequently fall into the mistake of thinking the entrance must be on the main front. Such a plan, of course, may be necessary in the

Plan 8

Plan 9

Plan 10

planning of town houses and public buildings, but in a large private residence in its own grounds the front entrance entails so serious drawbacks. It encroaches on the chief reception-rooms in front and it destroys their privacy. Visitors, in approaching the entrance, pass near to, or can look straight into, the windows of those apartments, and we can imagine the *contretemps*, unpleasant, sometimes embarrassing, to visitors and others occupying the rooms. A side entrance is out of the way, visitors and guests are brought together in an inopportune moment and are removed from the critical gaze of the occupants of the rooms. The first flight of the stairs in this plan can be brought with curved steps into the hall, and made central. The kitchen and other rooms are on the north-west front, and a convenient communication by means of a passage or serving room between the kitchen and the dining-room. In Plan 10 the hall is a large apartment lighted through the staircase hall on one side, which communicates with a conservatory running along the south front, and having an opening into the drawing-room. On the north side of large hall is a con-

ving direct access from the entrance vestibule into a lavatory, and at the end into a billiard room, with the conveniences attached thereto, and the whole can be shut off by a door from the main hall. The dining-room is in connection with the kitchen offices, having an entrance therefrom and also from the hall. The first-floor plan has a gallery round the hall, the rooms being set back. The last plan, 10, shows an arrangement for a smaller house, with the hall lighted at the side. Conveniently placed is a reception room, entered from the vestibule, and the usual conveniences are on the farther side of the staircase. The plan has the merit of being concentrated; the stairs are out of sight of visitors entering the vestibule, yet of sufficient size and importance to give dignity to the hall. In the first two arrangements the stairs can be made to form a part of the hall or be screened off from it. In Plan 9 the separation could be made by two columns with attached pilasters, if the design was Italian, or by an arcade of three arches, a treatment that would allow ample light to enter the hall through the conservatory. Ingenuity can suggest many very charming arrangements by which the hall or vestibule can be connected to the conservatory or plant house, and we shall show a few of these combinations as we proceed.

#### THE STORAGE OF RAINFALL.—BUILDING BASEMENTS AND LEVELS.

THE recent disastrous floods which have taken place in many of the low-lying districts of the metropolis and elsewhere have shown the futility of depending on the existing arrangements for carrying off the surplus water during very heavy and continued rains. Whenever we have a rainfall that is above the average, the inadequate capacity of the conduits is proved beyond any doubt. A week or two ago we had reports of basements of houses at Hackney, Poplar, the Isle of Dogs, Kennington, Peckham, and other parts, having been flooded by water, or, rather, a dilution of sewage. In many houses which have basements or underground rooms, the gullies intended for their drainage were literally found to be disgorging their contents and discharging the liquid portion of the drains into the dwellings. Even outside grated openings were in some cases converted into fountains of dirty water. The attempts made to stop the flow only rendered matters worse. In vain people applied to the vestries and district boards—the grievance had to be endured, and furniture removed from the underground rooms.

We do not propose now to enter into the various questions more or less concerned in these periodical devastations further than to remark that too much confidence is placed in a system of drainage which, however perfect it may have been in its inception and day, is now quite inadequate to meet the ever-increasing area of buildings. As land comes to be covered by houses and paved streets and yards, so the quantity of rainfall to be got rid of by the drains is increased. On paved and roofed surfaces where percolation cannot take place the rain collects in masses and forces its way with redoubled energy down the pipes and drains into the sewers. The latter have been designed to carry off the ordinary house drainage of a certain area, and, in the majority of cases, are unprepared to discharge storm-water quickly enough to prevent overflow. The occurrence of last month is not exceptional. In April, 1878, a heavy rainfall took place, which was registered as 2in. in London streets in about 19 hours. The main drainage system was found inadequate to meet the emergency. The south of London suffered immensely, and the Effra

sewer burst. The question of rainfall discharge was mooted at the time, but has become more urgent since. The original report on the main sewers stated that they were of capacity sufficient to carry off all flood waters—that is to say, the storm water would be intercepted from the low-lying districts on the south of the Thames. They may have been so then, but their capacities are unduly taxed by the more rapid discharge of storm waters from the higher districts around, which are now built over. The metropolitan sewers were designed to provide for an arbitrary quantity of rainfall, amounting to a fraction of that which is known to fall, or, we believe, to about 0.25in. in 24 hours. For this purpose they were doubled in area. It would add enormously to the cost of sewerage a town if the sewers were made large enough to hold the storm-waters during rainfalls such as we have had; it has indeed been calculated that something like sixteen times the area necessary for ordinary sewage would have to be provided. Sir J. Bazalgette very wisely, in order to carry off excessive thunderstorms, constructed overflow weirs, a very large one of the sort having been recently constructed at Deptford. These act as safety valves during severe rainfalls, and have been placed at the junctions of the intercepting sewers and the main valley lines. Notwithstanding these safeguards, we are threatened with floods forcing their way into basements and cellars at every heavy storm.

From these facts we infer that other measures ought to be carried out. There are only two ways: either to supplement the present system of sewers by conduits or channels in the roadways, or by specially constructed storm-water reservoirs or sewers; or to raise the basements of buildings in the low-lying areas above flood level. The idea of making reservoir sewers has now been generally abandoned by engineers, who prefer the separate system. Unfortunately, that system has been very imperfectly carried out owing to the patchwork way in which our towns have been sewered. Between advocacy of the two systems the storm waters have been allowed to look after themselves. But their provision cannot be put off any longer. Our great towns suffer more now than they did in former years. The allowance made by engineers to double the area necessary for ordinary contingencies is quite inadequate, and will yearly become more so. Taking London, as we have hinted, the engineers concluded that  $\frac{1}{2}$ in. of rain in 24 hours was the greatest quantity that fell on the average, and that this amount did not contribute more than one-eighth or one-half to the sewers. The overflow weirs which are in the valleys or occupy the old channels into the Thames have saved large neighbourhoods from floods, but even they are insufficient to prevent the flooding of basements. It is chimerical to think of other modes of storing or discharging storm waters in London. We are therefore driven to the second measure to keep out of harm's way, by making it compulsory to build houses at a higher level in the lower districts, and to omit the construction of underground rooms and basements. After the shocking revelations that have been published respecting the submersion of houses at Poplar and other parts, the legislature should frame regulations to restrict the construction of dwellings with basements in every locality where experience has shown that an exceptional rainfall has been productive of danger to health. Even the ordinary London half-basement in clay soils, or basins surrounded by hills or higher land, is sometimes inundated, rendering it necessary to ascend a story higher whenever there is a heavy storm. We have always advocated their disuse, as being an undesirable mode of increasing

accommodation. The problem of the discharge of rain from roofs and paved surfaces is an important one in towns. How can some of the water be stored, and so diminish the discharge? We may imagine what a difference in the amount which finds its way into the sewers would be made if every house in a town had a rain-water storage tank large enough to contain, say, a quarter of a cubic foot of water for each square foot of roof area. The roof of an ordinary house receives at least 1,000 cubic feet of rainwater annually, and we have it on Mr. Symons' authority that if all the water falling on a roof could be collected a rainfall of 20in. would give 93gals. per square yard per annum. The architect has it within his power to regulate and control the amount which passes away and is wasted, only to flood adjacent low districts; he can bring into requisition the useful rainwater "separator," which enables a proportion of the water to be stored and the remainder to be used as a natural cleansing agent. The engineer has now to deal with large slated and paved areas over which the rain rapidly passes in great volumes to augment the already large amount of sewage. He can allow little for evaporation or percolation under these circumstances. Future sanitary and building legislation might profitably be directed to a mitigation of the evils in several ways. The sanitary authority ought to have the power to decline to pass plans of dwellings to be built on sites which cannot be easily drained or which have cellars. Those buildings which are so placed ought to be protected by valves to prevent floods entering. All areas liable to be flooded should be raised or protected by embankments; storm-water channels or drains should be provided in the streets, and all valley lines and natural streams should be maintained and improved where necessary to assist in the carrying off of storm-water. Rain-water tanks should be required to every house and over a certain area. If these several regulations were carried into operation we might be spared a repetition of the calamities which have lately visited Poplar and various other parts of the Metropolis.

#### PRACTICAL ARCHITECTURE WITH DETAILED ESTIMATES.—VI.

By HENRY LOVEGROVE, F.S.I., Surveyor.

##### CARPENTER.—NOTES.

THE work of the carpenter is connected with the carcass of the building, and the joiner with the finishings. Some affirm that the carpenter does not use a plane, while a joiner is constantly using one, which is not strictly true, as roof timbers and floor timbers are often wrought.

Measure the timber in the roofs and floors as cube, unless under 3in. square, when it should be measured by the foot run, and when under 2in. thick by the foot superficial.

The following selections from the dimensions will explain better than mere directions how the various portions of the work should be taken; the specification, dimensions, abstract and bill explain each other.

58. *Roofs*.—Frame the roofs as shown on sections, the rafters to be in one length, notched and spiked down to plate; trim for chimney shafts. Put lin. deal gutter and valley boards and bearers to chimneys and other gutters. The rafters  $4\frac{1}{2}$ in. by  $2\frac{1}{2}$ in., collars 5in. by  $2\frac{1}{2}$ in., hips and valleys 9in. by 3in. ridge.
59. *Ceiling Joists*.—The ceiling joists to be  $4\frac{1}{2}$ in. by 2in., and all roofs are to have the necessary tilting fillets and beaded fascias at eaves.
60. *Dormer*.—Form the dormer in roof, as shown, with 4in. by 4in. head sill and posts, the gable to be filled in with 4in. by 2in. studs, and the cheeks to be covered with lin. close jointed boarding for lead.

Carried to summary ...		

STRAINS.—III.\*

By G. A. T. MIDDLETON.

FLANGE STRAINS.

IN addition to the shearing stress which is calculated to be borne by the web, the flanges of flanged structures have to bear direct tensile and compressile strains.

Fig. 13.

This is evident, as shown at Fig. 13, for a cantilever tends to bend under a load so as to place the lower flange in compression and the upper in tension, while a beam tends to bend in such a way as to place the lower flange in tension and the upper in compression. It will be found upon investigation that in any vertical section the tension in the one flange is equal to the compression in the other, and that there is a line along the web at approximately half its depth (if the girder be properly designed), known as the neutral axis, where there is no strain. In practice it is usual to consider that the whole of the tension and compression is borne by the flanges, and that the web has only to be made sufficiently strong to resist the shear.

In order to ascertain the strains in the flanges, it is first necessary to assume the length (or span)  $l$ , and the depth  $d$ . The exigencies of the particular case under discussion will generally determine  $l$ , while  $d$  is usually assumed as some fraction of  $l$ , varying, as circumstances will permit, from 1-12th to 1-20th. These being given, the remainder is a matter of leverage. The double line in Fig. 14 shows

Fig. 14.

the bent lever set in action by the weight  $W$ , at the end of a cantilever, causing the tensional strain  $S$  in the top flange at the point nearest the support—where the strain is greatest. The fulcrum of this bent lever may be assumed at  $f$ , provided that the neutral axis be through the centre of the web, and round this point moments must be taken. The moment  $S \times d$  must, to produce equilibrium, be equal to the moment  $W \times l$ , generally known as the bending moment. These can be equated thus—

$$S \times d = W \times l$$

or, dividing both sides by  $d$ —

$$S = \frac{W \times l}{d}$$

Of course, in the above it is necessary that whatever units be adopted for  $l$  and  $W$ , the same units must be adopted for  $d$  and  $S$  respectively. That is, if  $l$  be taken in inches,  $d$  must be taken in inches also; and if  $W$  be taken in tons, the strain  $S$  will also be ascertained in tons.

If the strain be wanted at any intermediate

spot it can be ascertained, as shown in Fig. 15, by assuming a bent lever round the fulcrum  $f$ , and taking the strain and bending moment's round  $f$ . Then—

$$S' \times d = W \times l'$$

or—

$$S' = \frac{W \times l'}{d}$$

As  $l'$  (Fig. 15) is less than  $l$  (Fig. 14), therefore  $S'$  is less than  $S$ . This proves that the

Fig. 15.

greatest strain is at the support. Under the weight,  $l$  is reduced to  $nil$ , when the strain also become  $nil$ , and the value of  $S$  will be found to vary uniformly from  $nil$  under the load to its greatest value at the support. The value of  $S$  will be the same whether it represent the tension in the top or the compression in the bottom flange, at whatever spot it may be taken. It is only necessary to reverse the bent lever and to assume  $f$  in the top instead of the bottom flange to prove this.

The value of  $S$  in the formula  $S = \frac{W \times l}{d}$  can be ascertained graphically as in Fig. 16. Assuming  $pq$  as the depth ( $d$ ), and  $qr$  as the

Fig. 16.

length ( $l$ ) of the cantilever, set up  $tq$  equal to  $W$ , according to a scale of weights as previously explained. Join  $pr$ , and from  $t$  draw  $tu$  parallel to  $pr$ , meeting  $qr$  produced in  $u$ ; then  $qu$  is equal to  $S$ , for  $pqr$  and  $tqu$  being similar triangles, therefore—

$$qu : qr :: tq : pq,$$

or, multiplying the extremes and means inversely and equating—

$$qu \times pq = tq \times qr,$$

that is—

$$qu = \frac{tq \times qr}{pq} = \frac{W \times l}{d}$$

which proves that  $qu = S$  to the same scale of weights to which  $tq = W$ .

By placing the compasses at  $q$ , and describing

Fig. 17.

a quadrant with radius  $qu$ ,  $qx$  is made equal to  $S$ . Join  $xr$ , and then ordinates drawn from

\* All rights reserved.

the bottom flange to the line  $xr$  will denote the strains in the flanges at any points to the same scale as that to which  $tq$  represents  $W$ .

When a cantilever is subject to a distributed load, such load may be assumed to act at its centre of gravity (see Fig. 17). The bending moment is then but  $W \times \frac{l}{2}$ , the bent lever being as shown in Fig. 17, and the equation of equilibrium obtained by taking moments round the fulcrum  $f$  becomes—

$$S \times d = W \times \frac{l}{2}$$

$$\text{or } S = \frac{Wl}{2d}$$

If the strain be wanted at any intermediate spot, it can be ascertained as shown in Fig. 18,

Fig. 18.

that portion of the load only being considered which rests between the spot at which it is required to determine the strain and the end of the cantilever. The equation of moments would then be—

$$S' \times d = W' \times \frac{l}{2}$$

or

$$S' = \frac{W'l}{2d}$$

In this case, as in that of an end load, there is found to be no strain at the end of the cantilever,  $W$  and  $l$  having both diminished to nil, while the greatest value of  $S$  is obtained at the support where both  $W$  and  $l$  are greatest; but

Fig. 19.

the intermediate variations are as the square of the distance from the extremity of the cantilever, instead of being uniformly as the distance.

The value of  $S$  in the formula  $S = \frac{Wl}{2d}$  can be ascertained graphically, as shown in Fig. 19, in which the same letters have been adopted as

Fig. 20.

in the similar Fig. 16,  $r$  now being placed under the centre of gravity of the total distributed

load  $W$ . The same reasoning being followed as that used with Fig. 16, it is seen that in the similar triangles  $pqr$ ,  $tqr$ .

$$qu : qr :: tq : pq$$

or

$$qu \times pq = tq \times qr$$

$$\text{therefore } qu = \frac{tq \times qr}{pq} = \frac{W \times \frac{l}{2}}{d} = \frac{Wl}{2d}$$

and, therefore,

$$qu = S.$$

To determine the strains at intermediate points, set up  $q$  equal to  $qu$  (or  $S$ ), as shown in Fig. 20. Between  $x$  and  $r$  set up a semi-parabola, having its apex at  $r$ . This may be accomplished by dividing  $xq$  into any number of equal parts, as at  $a$ ,  $b$ , and  $c$ , and  $qr$  into the same number of parts as at  $d$ ,  $e$ , and  $f$ . Join  $a$ ,  $b$ , and  $c$  to  $r$ , and through  $d$ ,  $e$ , and  $f$  erect vertical lines. Join  $x$  to  $r$  by a line passing through the points of intersection, thus tracing the outline of a semi-parabola. Ordinates drawn to this from the bottom flange will give the strains at all intermediate points to the original scale of weights.

[Some correspondents have taken exception to the theory advanced in the chapter upon shears with respect to the shearing stresses in the centre of a beam when loaded at more than one point. It is, however, correct, for the whole of the first load which is met by one of the reactions cannot possibly go to diminish the effect of the reaction; but only that portion of it to which some of the reaction is due. The same thing occurs on the other side, and the remainder, being similar forces in parallel directions, have to be added together to denote the shear in the beam between the loads. Fortunately the matter is in practice one of small importance, as there is always a great excess of metal in the webs of flanged structures over that which is necessary to resist the shear, even if it were true (which it is not), that the webs alone offered any resistance to the shearing stress.]

(To be continued.)

#### GOVERNMENT BUILDING CONTRACTS.

THE reply of the First Commissioner of Works (Mr. Plunket) to representations made to him by a deputation on behalf of the various branches of the London building trades has just been published.

The deputation suggested that in all future contracts entered into by the Commissioners of Works Department a clause should be inserted providing—(1) That all labour employed by the contractors should be of the best quality; (2) that workmen should be paid at the standard rates of wages; (3) that the working hours should be in accordance with the rules and customs of the London building trade; (4) that no overtime should be permitted; (5) that no portion of the work should be sub-let. The First Commissioner replies that the form of contract at present in use covers the first and last suggestions. As regards overtime, he says "there is a standing order that overtime is only to be resorted to in cases of urgent necessity." "There remains," continues Mr. Plunket's secretary, "the second suggestion that workmen should be paid at the standard rate of wage, a point which is not touched either by the form of contract or by the practice of this department. The question presents great and obvious difficulties, and the First Commissioner, after giving it his most careful consideration, regrets that he is unable to see any method of procedure which the Board could properly adopt for the purpose of promoting the object which the United Trades Committee have in view. It is of the essence of the system of contract that a contractor should be free to use his own discretion in regard to the means to be employed for executing his contract, and the Commissioner is not prepared to introduce so serious an infringement of the principle of contract as would be involved in an attempt to dictate to a contractor the terms on which he should engage the labour he employs. It is the duty of this department, as guardian of the public interest entrusted to its care, to see that a contractor executes properly and in accordance with the specification the work stipulated for in his agreement. But the duty of this department ends there, and the First Commissioner does not think he would be justified in allowing the responsibility of the Board to be extended into a region with which they have no direct concern, and in which it would be difficult for them to exercise an effective control. The First Commissioner cannot, therefore, undertake to modify the practice of the department in this respect in the contracts into which it may enter in future."

The United Trades Committee consider this reply unsatisfactory, and the secretary, Mr. George Dew, asserts that one Government contractor pays from 1½d. to 2½d. below the standard rates paid by London builders.

#### ARCHITECTS' JOINERY.

WE have often hinted how desirable a handy book of architectural joinery would be to those who require suitable designs. Mr. F. A. Fawkes published some time since a work on "Architects' Doors, and their Ornament," which included several useful types of doors; he has now brought out some details of mouldings, architraves, doors, windows, and chimney-pieces designed and manufactured by him. These details are intended to assist architects in selecting such work. Amongst the plates given are details for architrave mouldings, door-panel mouldings, dado and picture rails, enriched door mouldings, cornices, and skirtings. These are shown by photographic illustrations, half-full size, from the real examples, mitred, representing the effect of the mouldings under light and shade, by which anyone can obtain a very good idea of the executed designs. The mouldings exhibit a superior finish and sharpness; the enrichments are made from a specially-prepared composition, tough, and not liable to crack or crumble like plaster. The enriched mouldings, architraves, cornices, and dado rails comprise a variety of architectural ornament suitable for Renaissance and Classical design, the prices of which executed in red deal, pitch-pine, and yellow pine are given. The architrave mouldings are cut to proper lengths for doors up to 7ft. by 3ft. in sets of jambs and head. Thus, shouldered architraves can be had in red deal as low as 11s. per set. The interior doors show various arrangements of panels; the ornamental and exterior doors include glazed panels in various Queen Anne and Renaissance styles. Dado panelling, overdoors, friezes, mantels and overmantels, and combinations of these details appear, so that the architect can select his own details for doorways and other joiners' works. By this mode of selecting details, anything like stereotyped patterns may be avoided, and a superior class of workmanship may be secured at reasonable price. Mr. Fawkes's book of designs is published by Mr. B. T. Batsford, of High Holborn, and its price is 2s. 6d. Architects and builders will find it a useful work in the office.

MESSRS. MCGAW AND CO'S, NEW MOULDING MILLS, YORK ROAD, LAMBETH.

THE accompanying illustration represents the new premises now completed for Messrs McGaw and Co., and which replace probably the oldest buildings of their kind—viz., moulding mills—in the metropolis. These works have been carried out on an extended scale, and reflect credit upon the owners for their enterprise and artistic spirit. The design is of a Renaissance character, and consists of three unusually lofty stories, averaging 16ft. to 18ft. each in height; with a roomy basement, and with a total frontage of about 82ft.

The materials generally are Sittingbourne stocks, faced with red Farnhams and the Farnley Iron Company's buff glazed bricks, of good quality, with Portland stone dressings.

The inscription band to the front elevation forms a bold and pleasing feature, and is executed in a very creditable manner by the Burmantofts Company in their coloured glazed faience.

The entrance doors are of Spanish mahogany, and the office fittings in pitch pine.

The basements are lighted with Messrs. Hayward Bros. and Eckstein's well-known prismatic pavement lights. Messrs. Measures Bros. and Co. supplied the girders.

Mr. Robert P. Whellock, A.R.I.B.A., of 45, Finsbury-pavement, is the architect, and Mr. James Holloway, of Lavender Hill, Wandsworth, was the contractor.

A new hall and schools are about to be built in White Ladies-road, Bristol, in connection with Redland Park Church. Mr. H. Overton Wills, of London, is the architect.

ARCHITECTURAL ASSOCIATION SKETCHES.—YORKSHIRE  
PENNY BANK, HALIFAX.—N.E. VIEW OF WONHAM,  
N. DEVON.—ST. BENET'S CHURCH, MONKWEARMOUTH.  
—NEW MOULDING WORKS, YORK-ROAD, LAMBETH.

## OUR LITHOGRAPHIC ILLUSTRATIONS.

## YORKSHIRE PENNY BANK, HALIFAX.

MESSRS. PERKINS AND BULMER are the architects of this building. We have no further particulars to hand.

## WONHAM, NORTH DEVON.

THIS house is now undergoing considerable enlargement by the addition of a fine dining-room at one end and a drawing-room at the other, and of an upper floor and principal staircase, from the designs of Mr. Brightwen Binyon, F.S.A., of Ipswich. The illustration we publish shows the entrance court, which is to the north; the main façade of the house is to the south, and commands a lovely view of the Valley of the Exe, which runs for about two miles through the estate. The erection of the tower and billiard-room, shown on the left hand of the illustration, have for the present been deferred. The contractors are Messrs. George Grimwood and Sons, of Sudbury, and the carving is by Mr. Sidney W. Elmes, of Chelsea.

## ST. BENET'S CHURCH, MONKWEARMOUTH.

THE foundation stone of this church was laid by the Bishop of Hexham and Newcastle, the Right Rev. Dr. Wilkinson, on the 28th ult. It is being erected by the Rev. Jules Du Flöer, to provide accommodation for the Catholics of Monkwearmouth, who have hitherto been obliged to utilise his extensive schools for Divine worship. The design is by Messrs. Dunn, Hanson, and Dunn, of Newcastle-on-Tyne, and is an inexpensive one, constructed of brickwork, with local stone dressings for the exterior. "Farleigh Down" stone is used in the interior. The interior effect will be one of great space, owing to the treatment of the main arcade, which rises to the wall plate, 30ft. high. The aisles have flat roofs in order to provide space for large windows, which amply light the building. In addition, there are large east and west windows. The internal dimensions are as follows:—Nave, 83ft. by 26ft.; aisles, 82ft. by 13ft. 6in.; chancel, 23ft. by 23ft.; and two side chapels 19ft. by 14ft. each. Sacristies are being built between the church and the presbytery, which was erected some years ago. The main roof is 50ft. to the ridge, and is panelled inside 40ft. above the floor level. The walls are now about 20ft. above the ground. Mr. Thomas Lumsden, of Jarrow-on-Tyne, is the contractor.

The foundation stone of a new tower now being added to St. Barnabus Church, Bradwell, Derbyshire, was laid on the 4th inst. The tower is being built of Hazlebadge limestone, with dressings of gritstone from Egan Moor, and will contain a clock with Cambridge chimes, supplied by Messrs. John Smith and Son, of Derby. Messrs. Naylor and Tait, of Derby, are the architects, and Mr. Alfred Hill, of Tideswell, is the contractor.

## ARCHITECTURAL ASSOCIATION EXCURSION, 1888.—No. II.

(WITH PHOTOGRAPHIC ILLUSTRATIONS.)

LEAVING Matlock Bath by an early train for Derby, the excursionists commenced the week's proceedings by visiting Longford Church (St. Chad), which scarcely warranted the long drive necessary to reach it. The chief point of interest in the building is the series of recumbent figures in alabaster and stone, commencing with the effigy of John de Cressey, the first rector of the parish. The others include monuments of Wm. de Salford, 1336, John de Longford, 1393, the Radcliffe's, &c. There are no other features in the church worthy of special remark. It was restored in 1843, by Stevens, of Derby. Marston Montgomery, some few miles further west, has a church (St. Giles), of some quaintness, although it seems to have been almost entirely rebuilt, and what is more important still, it is well kept and arranged, being also apparently well served. The modern wooden bell-turret over the western wall harmonises with the building as it stands on the brow overlooking the few houses which constitute the hamlet. The chancel-arch is said to be of Saxon date. We are unaware who is responsible for the work of reconstruction done here. The place was visited in passing to see the stained windows, which are of interest as specimens of Morris's glass, from the designs of Dante Gabriel Rossetti. Their effect is good and the colours harmonious, with excellent figure-drawing, as might be expected, and the glass looks as if it belonged to the church, and in no way asserts itself. No better praise could be awarded than this. At the foot of the village street is an old timber-built house, having a grand chimney built in stone and capped with brick; but not worth going out of the way to see. Somershall Herbert, two miles north of Lord Waterpark's 18th-century mansion at Dovebridge, belongs to the Fitzherbert family, thus obtaining an interest historically eventful, and the manor house is an uncommonly good specimen of half-timber construction, though neither large in size nor important in style. The "Queen Anne" alterations at the back part did much to spoil the building; but in front there is a great variety of treatment in the use of the oak timbering, which is solid, with plaster fillings or panels in simple patterns of clever design. Inside the house the good taste of the present occupier is everywhere evident, and the furnishing of the rooms is in good keeping with the place. The oak staircase, of 17th-century date, is a very pretty one, having some well-turned balusters of admirable shape. The weather during this part of the day was most unfortunate, so that no sketches of the house were possible; but it ought to be illustrated, and would make a good picture. Sudbury, the next place seen, is a mansion of considerable importance, the Derbyshire seat of Lord Vernon, who received the excursionists and took them over his house, which stands in a beautiful park of six hundred acres, close to the parish church and fronting the high road to Derby. The building is a complete example of Late English Renaissance of seventeenth century date. The lower part seems earlier than the walls above the main cornice where the angle quoins are rusticated; but although all the façades harmonise and are complete, we fancy the buildings are later than is generally supposed. Mary, widow of John Vernon, commenced the structure in 1622. Some ten years ago the late George Devey, the well-known architect, re-roofed the mansion and added the dormers and balustrade over the main cornice. The pediments have spandrels filled with carved stonework, backed by red brick, which gives them colour and interest, the scale of the carvings being massive and large. The fenestration of the façades bears but little reference to the floors inside, and thus the windows are partly shams, a not uncommon expedient in Old English domestic work of Later type. Inside the house there are some fine apartments, specially the long gallery overlooking the lake, and containing portraits of Lords Cromwell and Stafford and Sir John Vernon, three favourites of Charles I. There is likewise an extensive collection of books. The ceilings are elaborate specimens of plaster work, and the staircase is a florid example of the style. Some carvings

by Grinling Gibbons are shown as undoubted instances of his manipulative skill, and the family portraits by Reynolds and other masters are of great interest. The details of the exterior of the house seem ill-proportioned, but the general effect is deserving of note. Sudbury Church is full of monuments to the Vernons, commencing with that of John Vernon in 1600. Mr. Devey restored the nave, and added an organ gallery out of the north aisle very prettily. He removed the galleries round the church and re-seated it. The chancel, which is disfigured by a hideous east window of German pattern, given by the Queen in 1850, has been renovated by Messrs. Bodley and Garner, who added the stalls and reredos. The Montgomery tombs are early examples. At Hilton, still driving to Derby, a wayside timber-built house, erected by the Wakelyn family, is to be seen, and so the party, pushing on to meet the Liverpool express, passed through Etwall, where a halt was made. Here the church (St. Helen) is worth seeing, but restoration has ruined it. The founder of Etwall Hospital and Repton School, Sir John de Porte, has a mural brass in the sanctuary dated 1557, to himself and two wives. Another to Henry and Elizabeth Porte, 1512, with some other Porte monuments, constitute the chief objects of interest in the church. It has a square tower, and is picturesque enough, and so are the red brick and stone-built almshouses hard by the churchyard; indeed, the group furnishes a good specimen of Old English work erected towards the end of the 17th century, and forms three sides of a court constituting seventeen houses. In the centre is an elaborate ornamented gable and archway, with heraldic shields bearing the arms of the three trustees appointed under Charter of James I. Etwall Hall, the ancient seat of the Portes, now belongs to the Cotton family, and although built in Elizabeth's time has been so often altered as not to retain much of interest. The gardens and cut-terrace hedges are to be noted, however, as exceptionally fine gardening.

Tuesday's programme commenced by a visit to South Wingfield Manor, which we illustrated with descriptions last week, and so need here only refer our readers to page 167 for particulars, as the President, Mr. H. D. Appleton, took occasion to do when the party assembled within the confines of the old mansion. A long hour's drive brought the excursionists to Hardwick Hall, of which we print a view taken by Messrs. Bedford Lemere and Co., whose skill as architectural photographers is well known. In the BUILDING NEWS for January 6 last we also gave four charming interiors from the camera of Mr. Richard Keene, accompanied by an historical account of this complete and interesting mansion, the Marquis of Hartington's Derbyshire home, described by Lord Byron as "a most beautiful and venerable object of curiosity," and whatever may be said of its architecture, no doubt he was right. Along the balustrade of the towers, of which there are six, and in the parterre of the gardens, appear the builder's initials "E. S.," Elizabeth Shrewsbury, more familiarly known as "Bess of Hardwick," who was born in the old Hall, now a roofless, moss-grown, shattered building, situated a little to the S.W. of the greater mansion. The hall is full of good old furniture, both Tudor and Jacobean; rich tapestries, illustrative of the story of Esther and Ahasuerus; St. Paul's life, and a vivid rendering of the dangers encountered by Ulysses, the restless hero of Homer's "Odyssey." The house was built between 1580 and 1597, probably from the designs of the Smithsons. Its chief features are the chapel, with old ecclesiastical needlework and painted tapestries, the dining-room, drawing-room, staircases, state-room, library, "Mary Queen of Scots' room," picture galleries, and presence chamber. Henry Shaw, in his "Elizabethan Mansions," gives some finely drawn views, with elevations and plans, of the house; and Nash, in "The Baronial Halls of England," has some admirable drawings of the place, which stands in a grand park of 600 acres on a hill. The general effect of the building is unquestionably imposing, but the architectural detail is crude, and wanting in refinement, like much of the work which Huntingdon Smithson executed at Bolsover Castle. Walpole admires its extent and vastness, and we can do no more. Nevertheless, it is a treasure-house

of magnificent tapestries which for colour are perfectly wonderful; and grand as the pictures in the long gallery are, it is a pity that the tapestry seen *in situ* should be covered almost entirely all over. The old hall was built about 1520, and in some of its detail almost exactly corresponds with the existing hall, as, for instance, in the remains of ornamented plaster-work on the walls. Journeying still northwards, some six miles to the east of Chesterfield's crooked steeple, the party went over the hills by Calow and Duckmanton to reach the disappointing and grey fortress of Bolsover, towering over the quaintest of villages, and the dark verdant slopes of woodland mapped out by shadowed country lanes. The Maypole hard by was the familiar hostelry where Barnaby Rudge and his magpie found rough hospitality. Bolsover's history is fraught with many a record of battle, and back in the times of the Britons was a strongly fortified place no doubt, with earthworks left by the Danes and ancient defences erected by the Romans. There exists no trace now of the Norman fortress built by the Peverils, and about which entries remain dated 1172 and 1216, when, we read, the castle was strengthened. During the reign of Henry III. Bolsover had a tumultuous career, and when Sir Charles Cavendish, younger son of "Bess of Hardwick," bought the manor of Gilbert Talbot, Earl of Shrewsbury in 1613, the buildings were in ruins. "The new house at Bolsover" was his work partly; but his son, the Marquis of Newcastle, finished it, Huntingdon Smithson, who lies in the neighbouring church, being his architect. Here Charles I. and his queen, Henrietta Maria, were magnificently entertained on three occasions with lavish prodigality at a cost of £14,000, "Love's Welcome," by Ben Jonson, was specially written for one of these occasions, and the masque was performed on the terrace. In 1633 Bolsover Hall was wainscoted and filled with works of art and beautiful tapestry, but this is now gone. During the Commonwealth the grand range of buildings in which Charles had been made welcome with brilliant pageants were ruined to a mere skeleton, but the Duke of Newcastle, after the Restoration, partly repaired them. About 150 years ago this part of the castle was allowed to go to decay, and the valuable pictures and furniture removed to Welbeck. The Riding House was fairly capacious, and is now little better than a shell, but it has a good roof and handsome stone dormers. The dining-room was 78ft. by 33ft., the drawing-room 39ft. by 33ft., and the picture-gallery 220ft. by 28ft., or 54ft. longer than the gallery at Hardwick, and 11ft. longer than the ball-room at Haddon. The building which now constitutes the residence at Bolsover is the Elizabethan reproduction of the Norman keep, erected with the materials of the ancient tower, and the principal rooms are curious apartments, with central pillars and beautiful groined ceilings in two or three of the rooms; they contain some singular examples of woodwork made up from various sources. A library and museum till lately occupied the largest of the rooms, which measures 40ft. long, and is known as the "star chamber" because it has a stellated ceiling in fearful blue. The Etruscan and Grecian curiosities once here are now gone, and the castle is empty and spoiled of its hangings and Stuart relics. The line of old fortifications may be easily traced to the verge of the precipice upon which the castle stands. The following curious old MS. rhyme quaintly compares the relative characteristics of Bolsover with neighbouring houses:—

"Hardwicke for hugeness, Worsop for height,  
Welbeck for use, and Bolser for sight;  
Worsop for walks, Hardwicke for lall,  
Welbeck for brewhouse, Bolser for all."

Mr. J. A. Gotch described Bolsover Castle on the present occasion. It is, however, by no means picturesque, and, beyond the marble chimney-piece in the keep or tower building and the groining, there is not really much of interest to the architect, in spite of all that has been said. No doubt the fireplaces are, in a way, unique, but they are faulty in detail and proportion, save, perhaps, that in the groined hall and small room in the outbuildings. The mural paintings are exceedingly poor. As for the wanton Duke of Newcastle's palace, its ruinably reflects the history of his doings and his time. We shall give two illustrations of

the Elizabethan Castle next week. With a hasty visit to Chesterfield, where the twisted spire\* was seen, the day's proceedings terminated, and the travellers returned by train to Matlock.

Accompanying our plates to-day the following notes respecting Haddon Hall, visited on Thursday, may be of interest.

Haddon's history, unlike that of many another feudal mansion, has from the days of its earliest lords been associated with hospitality and the gentler arts of peace, neither sullied by acts of oppression nor marked by feuds or wars. Its grey stone turreted walls, ivy-clad and nestling among the trees, speak at once of home, and rich with picturesque beauties, architectural grandeur, and the delightful charm coming of tradition and romance, the old hall cannot fail to attract the artist and the antiquary. Its builders may have been men of rough manners and sparse culture; but under a crude exterior generous hearts at all times have been known to beat, and the owners of Haddon were frequently men whose characters proved this rule. Its earliest records reach back to the days when Haddon was a berewite of Bakewell, and Henry de Ferrars, the first known lord, held the place by a grant of the Conqueror (1086), which included no less than 114 manors in Derbyshire alone. He claimed one carucate (8½ acres), but subsequently, in a greatly extended holding, Haddon belonged by tenure of knight's service to William Avenell, who gave part of his land to Roche Abbey, and thus propitiated the monks there, and obtained their prayers. His pretty daughter, Avica, married Richard de Vernon, who, in consequence, became possessor of Haddon Hall; and his family held the property for three centuries, until it passed to the family of Manners. Nearly everybody knows the story of the romantic marriage, in consequence of which this transfer came about. The secret attachment of beautiful Dorothy Vernon to John Manners, with whom she stole away from the Hall at night, when the lovers met on the terrace during the progress of the festivities and ball given in honour of her sister's wedding, is well described in verse:

"It is night with never a star,  
And the hall with revelry throbs and gleams;  
There grates a hinge—a door is ajar—  
And a shaft of light in the darkness streams.

"A pale sweet face, a glimmering gem,  
And then two figures steal into light;  
A flash, and darkness has swallowed them,  
So sudden is Dorothy Vernon's flight."

Then came the wild-ride scamper across the country to the altar where the sacred bond was tied. On the death of Dorothy's father, Sir George Vernon, about 1570, she inherited the property, and so her husband, Sir John Manners, became the owner, and through the Manners family it now belongs to the Duke of Rutland. Dorothy's door still remains as she unbarred it, and the steps outside the threshold which she crossed to join her lover are the same as on the night of her flight from home, only that time has given the place a softened beauty, and the poetry of the incident enhanced its interest. Sir George Vernon was known as the "King of the Peak," and many a charming story is told of his despotic liberality. He succeeded to the estates in 1515, and during his reign the Hall was filled with an almost perpetual odour of feasting, for he was neither niggardly in his banquets nor turned the hungry away. The plan of the buildings at Haddon, roughly speaking, is a parallelogram, divided into two courts, like South Wingfield Manor, by the hall and kitchen range. The average length is 250ft. by 150ft. wide. We gave a complete set of measured drawings of the hall,† with plans, sections, and elevations, in the BUILDING NEWS for Feb. 11th and 18th, and March 11th, 1887, from the R.I.B.A. Silver Medal drawings, by Mr. Frank Bellis. These plates are now out of print; but we understand that Mr. John Douglas, of Chester, is about to publish a monograph of Haddon Hall, comprising these same drawings and a series of

\* Measured drawings of this spire were printed in the BUILDING NEWS, Sept. 3, 1888.

† Other illustrations of Haddon Hall, including measured details of the woodwork in the chapel, have appeared in the BUILDING NEWS for April 2 and 16, 1875; April 2, 1878; July 6 and Oct. 5, 1883; and July 11, 1881. Some of these are by W. H. Lethaby. In the A.A. Sketch-book New Series, sketches are given of Haddon Hall in Vol. I. (1881) and Vols. III., IV., and V.

photographs, specially taken by Mr. Bedford Lemere for the work. To-day we print two detailed views, showing the interior of the ball-room or long gallery, and the drawing-room. These beautiful photographs are by Messrs. Frith and Co., of Reigate, and they were shown at the recent exhibition of photographs held in the Crystal Palace. The same firm have other fine views of Haddon Hall, and that of Dorothy Vernon's door is one of the most exquisitely-managed prints that we remember to have seen. The double-page geometrical drawing also given herewith represents the rich woodwork, panelling, and doorway on the north side of the ball-room set out in detail. The original of this plate was exhibited at the Carpenters' Hall, by Mr. Andrew Erskine, of Manchester, in the Exhibition of Joinery lately held there. To recount a description of Haddon Hall here would take more space than we have room for; but we may briefly return to the subject next week, when other illustrations of the place will appear in our pages, with concluding notes on the excursion.

#### COMPETITIONS.

NEW YORK.—The competition for the municipal buildings to be erected in the Central Park, New York, has been decided by the award of the third prize, of three thousand dollars, to Mr. B. N. Crawford, of Brooklyn, the fourth prize, of two thousand dollars, to Mr. Appleton P. Clark, of Washington, D. C., and the fifth prize, of one thousand dollars, to Mr. Joseph H. Stark, of New York. Besides these, a special prize of one thousand dollars was given to Messrs. Weston and Tuckerman, of New York, and another of two thousand dollars to Mr. Charles B. Atwood, of New York, whose design had been placed first by the judges, but was technically ruled out for failure to comply with all the requirements. Mr. Atwood will probably be further engaged so as to adapt it to a smaller building, possibly on another site.

#### SCHOOLS OF ART.

CRYSTAL PALACE.—The award of scholarships in connection with the Crystal Palace Company's School of Art, Science, and Literature (Ladies) was completed on Saturday. The Scholarship in Art was adjudged to Miss Berta Ohlenschlager, of Sydenham; the medal for painting in water-colours to Miss Kate Bennett, of Forest-hill. The judges were Mr. J. B. Burgess, A.R.A., Mr. C. B. Birch, A.R.A., and Mr. R. Beavis, R.W.S. Certificates were also awarded to students for painting in oils, drawing from the antique, and drawing from the life.

#### CHIPS.

The trustees of the British Museum have decided that the recension of the "Book of the Dead" now in the museum, and known as the "Ani" papyrus, shall be produced in facsimile, with the illustrations in the colours of the original, and the work is now being executed by Mr. Griggs. This hieroglyphic papyrus was written for a Royal scribe, Ani, about the commencement of the 19th dynasty—circa 1400 years B.C. It is complete, the first and last vignettes being intact. The papyrus contains a chapter of the "Book of the Dead," the 175th, not found in a perfect state elsewhere.

It is reported from Darlington that a warrant has been issued for the apprehension of Thomas Toward, builder, brickmaker, and contractor, Shildon, who is accused of obtaining money advances to the extent of about £15,000 by means of forged deeds. Toward disappeared about three weeks ago, and has not since been heard of.

Great efforts are being made to complete the new Roman Catholic Cathedral in Pekin, which takes the place of the Pei-Tang Cathedral restored to the Emperor of China, by December 8. The architect and builder is Abbé Favier, who has collected great stores of bricks, stone, and timber, and 600 workmen are now employed daily on it.

The School Board for Kinghorn adopted on Monday plans by Mr. John Murray, of Kirkcaldy, for a new infants' school. Accommodation will be provided for 250 children at an estimated cost of £1,100, or £4 8s. per head.

The Great Eastern Railway Company's new line from Shenfield to Southend-on-Sea has just been completed, and was inspected by the directors last week. Messrs. Holmes, King, and Co. have been the contractors.

## WAYSIDE NOTES.

THE Temple of the Sun whose cornices of burnished gold once shone forth in dazzling brilliancy from a towering mountain city of Peru, and whose golden image of the source of light, affixed to its western wall, caught the early morning rays that streamed through the great eastern portal, and reflected them on to the polished surfaces of innumerable plates, mirrors, and bands of gold, till the light of a thousand suns seemed to pervade the vast interior, is an edifice of antiquity that is exceptionally fascinating to the imagination, and one which impresses us more than anything else with the magnificence of the grand old Inca race. Little should we dream, when pondering over the past glories of this "Place of Light," as its builders called it, that its hallowed site would ever be in danger of being disturbed by the operations of a treasure-seeking Limited Liability Company. Yet it appears more than probable that, although the avowed object of the recently-formed *Compania Anonima Exploradora de las Hucasdel Inca*, on which there was an interesting article in the *Standard* of the 14th, is only to ransack ancient Peruvian burial-grounds, the directors, having once got in the thin end of the wedge, will turn their energies in the direction of Incarial ruins; and of these the Temple of the Sun assuredly presents the most tempting field, as we know that this building was second to none in point of richness in golden ornaments, what with cornices, friezes, bands, statues, and other enrichments. And, although when the murderous Spaniards appeared upon the scene, they ran off with all the gold that they could lay their hands upon, including the magnificent image of the sun, we may reasonably conclude that, in a treasure-burying age, much of the golden ornamentation would have been secreted in or near the site of the temple itself.

The objection to the ravages of the *Compania Anonima Exploradora, &c.*, is one of sentiment merely. In the "rampage" for treasure they may come across material beauty, and we ought to be rather glad to hear that fresh discoveries have been made through their explorations, if these discoveries throw any light on the much-vexed question of Incarial and pre-Incarial architecture. There is a rich field in South America for the archaeologist. Now that the early remains of the Old World have been pretty well overhauled, and every Cook's "circular" tourist knows all about the architecture of Ancient Egypt, and the mystery of old Assyrian art has been fully unravelled, we must look to the New World for further archaeological discoveries. It has long appeared to me that the ancient architecture of America has not received the attention its intensely interesting nature would warrant, although some months back I noticed in the *American Architect* that a gentleman of our profession had discovered that the earliest monumental remains of the New Hemisphere surpassed in age, by many thousands of years, the most venerable stones in the Old World. I wonder what Mr. Fergusson would have said to this? Such conjecturing is neither of use nor interest. An actual tour of an English architect amongst Peruvian architectural remains would be intensely interesting to a large section of the public; and in these days of international travelling, and of case-hardened globe-trotters, it should not be a herculean task to penetrate to the region of the Andes. It is true one would have to be an enthusiast of enthusiasts. To me the architecture of the Incas and their predecessors seems a wonderfully fascinating subject, and in the many hundred corners of the globe where I have wished to stand must be included the shores of Lake Titicaca, where are the vast, solitary monoliths of a pre-Incarial temple, called Tia-Huanacu; the deserted city of Pachacamac, where stands a great ruined temple, once, it is said, with doors of gold inlaid with precious stones; and the city of Cuzco, where was the world-famed Temple of the Sun.

The Panama Canal, according to an American engineer who writes to the *American Engineering News*, is not progressing so satisfactorily as it might. In spite of an immense amount of costly machinery and plant, he says, the unavoidable impression gained from a few

days' survey of the work is one of non-effectiveness. The steam excavators, of which we heard so much, are, it appears, only being employed as elevators for soil previously excavated by hand labour, and this is a very wasteful manner, fully 90 per cent. of all material excavated being handled twice and three times. Most of the excavating and dumping plant is badly deteriorated, and will have to be replaced if the work continues a year longer. The formation of the locks is being put off in an undesirable manner. The writer thinks that the intention is to finish the canal first, and in order to obtain money on "call" it will be represented that the canal is completed, excepting the locks. This is not a cheerful picture; but we must make allowance for the fact that it is an American report, and the Yankees, I understand, have all along considered that the making of the Panama Canal should have been left in their hands.

The Manchester Ship Canal, on the other hand, is progressing rapidly. According to reports received on the 15th, the work is being carried on with extraordinary vigour. Vast docks are being constructed in connection with the canal. On one section of the new waterway no fewer than 1,700 men are engaged, night and day, the length of the section being little over four miles. The steam excavators here are not being employed as at Panama; but are digging out the actual channel for the canal, and disposing of the earth in prodigious quantities. Perhaps it is hardly fair to contrast the undertaking in England with that in America, as the difficulties of the latter are incomparably greater.

The Board of Works Commissioners, having taken all the evidence of material importance that is at present available, have adjourned *sine die*. At the last sitting of the Commissioners Lord Herschell made one of his pithy remarks anent the sewage question. His lordship stated that, in his experience, no two authorities agreed as to the best method of dealing with the sewage of large cities, and our own experience tends in the same direction. Sir Robert Rawlinson's views on the new works at the outfalls on the Thames, which you commented upon last week, are anything but encouraging. I should have thought that, far as the new system may be from perfection, it would have been a vast improvement upon the old plan of discharging crude sewage into the river. In this matter of purifying old Father Thames, I notice that the Conservators have just issued their annual report. It is a good report, and indicates a great improvement in the condition of the water. When Henley Regatta came along, I looked about in vain for some information as to whether the house-boat nuisance had been prevented; but, it now appears, strict measures were taken to put a stop to what was a source of considerable pollution. Indeed, the only noticeable source of contamination to the river above the intakes of the water companies is the town of Staines. Staines ought to know better, as I have before intimated; and every drinker of water drawn from the Thames below this town ought to help to put down the nuisance. The Local Government Board have just issued directions to sanitary authorities in case of epidemic diseases, and much is said of the importance of an uncontaminated water-supply; but the inhabitants of the south-western suburbs of London, many of whom drink three glasses of sewage in every hundred of pure water, may well ask to be first supplied with water from an uncontaminated source before being lectured as to how to preserve it from pollution.

Metropolitan improvements seem to be associated in the minds of members of the Board of Works with pulling down something. So long as the Board officials get through a lot of this sort of work they seem in good humour. Well we, as architects, cannot complain at this. But it is curious to note how whilst so many important works remain to be done, a member of the Board will propose, as the most urgently needed improvement, that poor old St. Mary-le-Strand should be swept away. At the last meeting of the Board Mr. George Edwards said that the Committee had proposed local improvements amounting to £451,400, and a good deal

of it could be spent on improvements much more required. For instance, said Mr. Edwards, there was an old and dilapidated church in the Strand. Why should not that be taken down, and allow the Strand to be widened up to the Law Courts? To this sort of pulling down many of us would object, although the traffic in the Strand might be benefited. It is wholly unnecessary, however, to pull down St. Mary's Church, as the extra roadway is easily obtainable by widening the north side of the Strand near this building, and sweeping away the Holywell-street block—a means of getting over the difficulty that I should have thought Mr. George Edwards had heard of long ago.

The pick and shovel are busily engaged on the vacant ground on the western façade of the Law Courts, and soon what was a howling wilderness will be a garden fair, bright with flowers and shrubs. A curious outlook is that bounded by the medley of incongruous buildings surrounding this ground. Forming a background to the stone screen at the head of a rather picturesque flight of steps is a corner of Mr. Waterhouse's red brick and terracotta building; adjoining is the smoke-begrimed mass of King's College Hospital, with a few remains of the old "rookery" that once surrounded it; and between this and the uninteresting buildings on the south-west corner are the old red brick tenements of tree-shaded squares of Clement's Inn. When we are able to stroll about the garden paths many points of sight will display new groupings not perhaps wholly devoid of beauty.

I was at Sedbergh not long since, and was struck by the great boulder recently set up in the market-place, which was excavated during the works in progress for the great storage reservoir now being formed in connection with the Middlesbrough water supply. The giant boulder bears a brass plate declaring that it was set up there in the Jubilee year of Her Majesty, who, as most people will remember, generally travels *incognito* by her title of Countess of Sedbergh. The storage reservoir I mentioned just now is an important work, and is being carried out under the direction of Mr. James Mansergh, C.E. It is lined with about 300,000ft. super. of Claridge's Asphalte by Claridge's Patent Asphalte Company, Limited, who are generally intrusted with works of this kind where impermeability and strength are desiderata. Sedbergh and the district are worth visiting by West Yorkshire rambles. I was told there was good trout-fishing near the town, but had only time to inspect the important work referred to. GOTH.

## CHIPS.

A meeting of the parishioners of St. Michael-le-Belfrey, York, has been held to consider a report of Messrs. Demaine and Brierley, architects, of that city, with reference to the condition of the church. The report stated that a good deal of the stonework, especially the carved and moulded parts, is in a state of very rapid decay, and that the estimated cost of repairs is £1,053. The report was adopted, and a building committee appointed.

St. Andrew's Church, Stainland, about four miles from Halifax, was reopened on the 1st inst., and consecrated by the Bishop of Wakefield. Important additions and alterations have been made to the church, all that remains of the old edifice now being the tower and the north and south walls. The work has been carried out from designs by Mr. W. Swinfen Barber, and includes the removal of the old galleries, an extension eastward from the nave of 22ft. 6in., the construction of the organ-chamber and vestries, &c. The new chancel has an elliptic-formed ceiling, and is marked by four Doric columns. The cost of the entire alterations is about £3,000.

Foundation stones of a new Primitive Methodist chapel were laid at Far Cotton, Northampton, on the 2nd inst. The building will be Gothic in style, and of red bricks with stone dressings. Seats will be provided for 200 persons. Messrs. J. Ingman and Son are the architects, and Mr. J. W. Loveday, of Queen's-road, Northampton, is the contractor.

The Caledonian Hotel, at the corner of Princes and Castle-streets, Edinburgh, is about to be remodelled and enlarged from plans prepared by Mr. J. Macintyre Henry, of that city. The style adopted is a free treatment of Italian Renaissance. Four stories, with pyramidal towers at the angle of the streets and ends of the building, are to be added to the existing structure.

## THE METROPOLITAN BOARD OF WORKS INQUIRY.

THE closing session before the vacation was held by the Royal Commissioners on the Metropolitan Board of Works on Tuesday, Lord Herschell presiding.

Mr. G. B. Richardson, a member of the Board, in the minutes concerning an inquiry instituted by the Board in 1867 into the negotiations for Mr. Furness's contract for the Thames Embankment. The inquiry arose out of the examination of Mr. Furness in the Bankruptcy Court. Mr. Doulton then admitted negotiating the sureties for Mr. Furness, but denied that he had retained any of the money for his own personal benefit. The feeling of the Board was against censuring Mr. Doulton; but it was understood that if he could not get a motion from the Board which would practically have the effect of relieving him from being regarded adversely Mr. Doulton would resign. As such motion was not carried, Mr. Doulton did sign on February 18, 1868. The practice of the Board to require sureties from contractors was given up immediately after the inquiry he had referred to. Since then the Board had had 10, 12, or 15 per cent. out of the money as security that the work would be duly performed.

Mr. C. M. Roche, a former member of the Board, said the statement by Mr. Furness that he had promised to support his tender if he would enter into a contract to obtain all his granite from the Lundy Granite Company was absolutely false. Witness had not the slightest interest in that company, either by shares or anything of the kind; he had simply acted in a professional capacity. Other statements made by Mr. Furness were untrue. The best tender for the Thames Embankment contract was Mr. Ridley's, which was £495,000, Mr. Furness's being £520,000. Mr. Ridley's tender was originally selected, subject to inquiries. Witness's firm had been concerned professionally advising the gentlemen to whom the Lundy Granite Quarry belonged with reference to the formation of a company. After Mr. Ridley's contract was accepted those gentlemen sent instructions to his firm, at first to prepare a contract with Mr. Ridley to take the granite, and then to put the conditions in the shape of a letter. That letter having been sent to those gentlemen, they, and they alone, wrote Mr. Ridley upon it. Witness was introduced to Mr. Furness by Mr. Doulton. They were each other in the waiting room, which was one of the public rooms; it was not true that witness locked the door. The committee reported that the result of the inquiries regarding Mr. Ridley had not been sufficiently satisfactory to induce them to recommend the tender to finally accept his tender. Mr. Doulton had negotiated between Mr. Furness and the directors of the Granite Company, though witness was not then aware of Mr. Doulton's exact position. Witness had nothing whatever to do with either the price or the terms of the contract. His instructions were at Mr. Furness was going to enter into the same contract as Mr. Ridley; and that was all he had to do with it. When the matter came before the Board he seconded a resolution to the effect that, Mr. Ridley having agreed to deposit £20,000, his contract should remain, and voted in favour of Mr. Ridley's tender. Mr. Ridley's contract to take the granite was an absolute one; Mr. Furness's was subject to the approval of the engineer. Lord Herschell: Mr. Ridley's contract was more favourable, then, to the Lundy Granite Company than Mr. Furness's?—I should doubt very much whether it was better. Witness, continuing, said that Mr. Furness's contract was accepted. Mr. Furness did not carry out his contract with expedition, and witness had frequently to bring the matter before the Board. It appeared that by doing he had incurred Mr. Furness's enmity. Lord Herschell: Does it not strike you as being you rather in an equivocal position, in presenting a contract for Mr. Furness's signature on behalf of the Lundy Granite Company for materials for a contract which had not yet been obtained from the Board?—Witness: If I ask me now I should say "Yes," without hesitation.

Mr. Furness, recalled, said that if the Commission would read over the evidence given before the Board with reference to the Thames Embankment it would modify what had been

said by the last witness. Lord Herschell said that they would read it all.

Mr. W. R. Lawson, City editor of the *Financial News*, said he paid a visit to the Board with the view of ascertaining how the business was conducted in relation to the letting of sites. Mr. Robertson was represented in the office by a clerk, and witness asked him what the ticks meant to the sites on the plans. He said that those sites were withdrawn from sale, but he did not know why, and in Mr. Robertson's absence he had no authority to give the public information at all. Witness afterwards called upon Mr. Robertson and asked him about Shaftesbury-avenue. He said, in reply, that the tenders received and accepted were never made public in any way, and that the public had no access to them whatever, either as ratepayers or tenderers. The minutes of the Board contained very little information with regard to the letting of sites. Witness said that he had examined the accounts of the Board so far as they were published. Since 1855 the Board had, he said, levied rates to the amount of more than £15,000,000; the coal and wine duties had yielded £8,000,000; the Board had raised £37,000,000 by loans, and thus had the spending of at least £53,000,000. No detailed accounts of this expenditure had yet been published. Particulars had been promised in an abstract said to have been presented to Parliament; but this abstract had never been printed.

Mr. Arthur Gunn, chief of the Accountant's Office of the Board of Works since 1869, said that the accounts published as a Parliamentary paper by the Board were considered the best form of accounts. The public could attend the audit.

Colonel Jones, V.C., said he was a partner with Mr. Bailey Denton, and on the 4th of May he sent in a memorial to the Commission containing precise charges against the Board with reference to the London sewage. The Board had taken no complete steps to ascertain what the probable cost of the permanent recommendations made by Lord Bramwell's Royal Commission would amount to before they rushed into very high experimental costs for attempting to avoid the permanent remedy.

Lord Herschell: This question of the disposal of the sewage is a question on which there is great difference of opinion. My experience is that no two people are agreed as to what system is good and what system is bad.—Witness: I admit all that, but I maintain that the scientific Royal Commission investigated the thing fully, and their conclusions have been thwarted.

Mr. Selway gave some further information as to the way in which the Works committee dealt with compensation cases.

Sir Joseph Bazalgette was recalled, and stated that the course pursued by the Board for the disposal of the London sewage was the right one. If they had undertaken the permanent works suggested at a cost of four million sterling it would have enormously increased the rates, and there would have been a revolution in London. What the Royal Commission estimated would cost £200,000 a year the Board were now doing for £76,000 a year; and that was the result of careful experiments.

Lord Herschell said the Commission had received suggestions that the expenditure upon the parks had largely increased since they had been taken over by the Metropolitan Board. They had had an investigation made, with the result that they were satisfied that even if, upon the whole, the expenditure was larger it was only so to a trifling extent, and there was not any ground for supposing that there had been either dishonesty or maladministration in that respect.

Mr. Blashill, the superintending architect of the Board, having given evidence, Lord Herschell said: The Commission have taken all the evidence which appeared to them material which is at present available, and we propose now to adjourn *sine die*. Before adjourning, the Commissioners desire to express their obligations to all those who have assisted them in their inquiry, and especially to the solicitors to the Inquiry Committee, for the care with which they have investigated some of the many communications which the Commissioners have received. They desire also to thank the Metropolitan Board for the informa-

tion, documentary and otherwise, which has been tendered, and to say that this information has been readily supplied without delay.

The Commission then adjourned. The report will be made within a couple of months.

## BOOKS RECEIVED.

*Illustrations of Old Ipswich* (Ipswich: J. Glyde, 35, St. Matthew's-street).—Part VIII. of this work deals with the Cornhill and its associations. The Cornhill, always the centre of municipal, mercantile, and political life in the borough of Ipswich, has been completely transformed during the past century: its picturesque and distinctive features, the Shambles, and their successors, the Rotunda, the Moot Hall, and the Market Cross, have been entirely swept away, with nearly all the old buildings which formerly surrounded the open square, and within the past twenty years the erection of a new Town Hall, Post Office, and Corn Exchange, in Venetian-Gothic and Free Renaissance styles, have effected a change in the appearance of the place. The history and character of the old buildings now demolished are described with the pen of an enthusiastic and painstaking antiquarian by Mr. Glyde in the number before us, and the many associations connected with the site are so interwoven with the architectural description as to sustain the interest of readers who know little or nothing of the town under notice. Careful examination of the entries as to the Shambles in the Chamberlain's accounts reveal no particulars concerning anyone bearing the name of Cardinal Wolsey, except entries between 1585 and 1587 relating to the payment of "Mother Wolsey" (or Widow or Elizabeth Wolsey in other places) for acting as "skavenger." The part before us is illustrated by an autograph, giving a facsimile of a drawing of the Cornhill as it appeared in 1785. The square is easily recognisable to persons familiar with Ipswich; but every feature and building is altered—the picturesque 16th-century cross is replaced by a hideous cast-iron lamp column and fountain of ironfounder's stock-pattern type; for the gabled half-timber houses stretching up Tavern-street, strewn in irregular perspective, are substituted a uniform row of white brick fronts, and a widened but still narrow thoroughfare cut up by tram lines, while the pseudo-Classic tower of St. Lawrence Church, which in the illustration peers over the roofs behind the Cross, is now refaced in flint and stone flushwork in modern Perpendicular style.

## CHIPS.

Good progress is being made with the erection of the new town-hall at Dewsbury, and the town council decided last week to obtain tenders for lighting the building by electricity. Mr. Henry Holton, of that town, is the architect, Messrs. E. Chadwick and Sons are the contractors, and Mr. W. H. Williams is the clerk of works.

The tender of Messrs. Mowlem and Co. has been accepted at £28,200 for the erection of public baths and wash-houses in Buckingham Palace-road for the baths commissioners for St. George's, Hanover-square. The architect is Mr. F. J. Smith, whose designs were recently, it will be remembered, selected in competition.

Building operations have been commenced for the erection of the first portion of a church at Ribbleson, Lancs. The present section will comprise the lower part of the tower, the nave and transepts, and the chancel and chancel-aisles, the upper part of the tower and the spire being left for future operations. The architect, Mr. R. Knill Freeman, of Bolton, expects that the work will be completed soon after Christmas. The church is to be dedicated to St. Mary Magdalene, and will accommodate 200 people. The cost of the incomplete church is estimated to be £2,500.

The annual meeting of the Essex Archaeological Society was held at Chelmsford on Thursday in last week, under the presidency of Mr. G. Alan Lowndes. After the transaction of formal business, an excursion was made to the churches of Great and Little Baddow, Hatfield Peverel, Boreham, and Springfield, to Hatfield Priory, and to New Hall, now occupied as a convent.

While digging among the ruins of the ancient Greek town of Chersonese, near Sevastopol, some workmen came upon the workshop of an ancient Greek sculptor, in which was an oven for baking clay models and about 50 terracotta figures belonging to the third century B.C.

## Building Intelligence.

**AUCKLAND CASTLE.**—The chapel of St. Peter in Auckland Castle, built by Bishop Cosin in 1665 on the site and with the materials of the baronial hall, has just been restored at the cost of the present Bishop of Durham, and was reopened recently. The restorations undertaken by Dr. Lightfoot, and for which Mr. C. Hodgson Fowler, F.S.A., of Durham, was the architect, may be divided into five sections, of which the first comprises the three east windows, the second consists of a reconstruction of the reredos and sanctuary, and the windows of the north and south walls form the third. They contain historical subjects connected with the see; while the fifth section comprises a display of episcopal shields on the walls of the chapel, and figures of angels above the arcade.

**HARROGATE.**—The memorial stones of a new Wesleyan Chapel and school were laid at Starbeck, Harrogate, on Monday, August 13th. The chapel is 41ft. by 31ft., with vestibule and lobbies; the school 27ft. by 18ft. The walls are of blue flagstone, with yellow sandstone dressings, and slated roof. The chapel, with open roof, is 22ft. to the collar. There are inlet fresh-air flues in buttresses, and vitiated air extractor on roof. The accommodation is for 200 persons, and the school for 70, at a cost of £850. Mr. J. Sadler, of Starbeck, is the builder, and Mr. T. Butler Wilson, of Leeds and Harrogate, is the architect.

**PETERHEAD.**—The buildings erected on Salt-househead in connexion with the new convict prison at Peterhead, having been completed, were handed over by the contractors, Messrs. MacAndrew and Co., Aberdeen, to Her Majesty's Prison Commissioners on the 31st ult., and were occupied for the first time last week. The space inclosed by the prison walls is six acres. Provision is made for the extension of the prison until it can accommodate 300 convicts, and for the erection of another block, also to contain 300 convicts. The prison is four stories in height, 156ft. 10in. long by 40ft. wide. A corridor, 18ft. wide, runs the entire length of the building on each floor. The cells are ranged on each side of the corridor, 26 on each side, 52 on each floor, or 208 in all. Each cell measures 7ft. 6in. long by 4ft. 6in. wide and 7ft. 6in. high. Each pair of cells is lighted by a gas jet protected on both sides by glass 1in. thick. The refractory block contains eight cells, of which two are "dumb," being doubled lined and fitted with double doors. These cells are 7ft. by 12ft. and 9ft. 10in. high, and two exercise yards are attached. The infirmary contains kitchen, doctor's room, surgery, and two cells on the ground floor, with bath room, &c., the cells being 13ft. by 7ft. by 10ft. high. Residences for the governor and the married warders are erected outside the prison walls. The cost of erecting the prison was £32,000.

**PONTYPRIDD.**—The arcade about to be constructed in the centre of the town to plans prepared by Messrs. Taylor and Evans, of Cardiff and Pontypridd, will connect St. Catherine-street and the streets adjoining with Market-square. It will be perfectly straight for its whole length, which is about 240ft., the width being 12ft., and there will be an even fall towards Market-square of 1 in 36. The glass roof is to be constructed with patent zinc glazing bars, supported by cast-iron principals. A feature will be the provision of complete dwelling accommodation to each shop. There will be 28 shops of various sizes, ranging from 13ft. by 10ft. to 24ft. by 17ft. Six on the northern side, with shops 14ft. by 22ft., will, in addition, have a second floor, and will contain six rooms, as well as the shop and usual offices. Five will be provided with a back entrance to a lane wide enough for a cart, and ten will have a sitting or living room at the back of the shop on the ground floor. The buildings at the Market-street end will remain as at present, with the exception of the ground floor. The building at the St. Catherine-street end will be new, and be constructed of red brick with Bath stone dressings.

**SOUTHBOROUGH.**—A service was held at Christ Church, Southborough, on Friday last,

when the building, after its recent enlargement and completion, was consecrated by the Bishop of Dover. The church has undergone an addition, which completes the original design of the architect. The old building consisted of chancel, nave, and transepts, and two aisles have now been erected as a memorial to Col. and Mrs. Blackburne-Maze. The tender of Messrs. Punnett, of Tonbridge, was accepted by the building committee for £1,267. The building is of red brick, in the Gothic style, and the new part is built in harmony therewith. The inside measurements of the new aisles are 48ft. by 42ft., and are divided from the nave by arcades and columns, with carved capitals.

### ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

**ROYAL ARCHÆOLOGICAL INSTITUTE.**—On Friday the members of this body visited, from their headquarters at Leamington, Warwick, Kenilworth Castle, and Stoneleigh Abbey. On Saturday they proceeded to Coventry. They travelled thither, a hundred strong, by railway, and were received by Mr. W. G. Fretton, F.S.A., who acted as guide. Among the places visited were St. Mary's Hall, St. Michael's and Trinity Churches, the Benedictine Priory, and the site of the ancient Cathedral Church of Coventry, St. John's Hospital, the Collegiate Church of St. John, and the Bablake Hospital. At the evening meeting a paper by Mr. J. Alfred Gotch, of Kettering, on "Seventeenth-Century Houses" was read for the author by Mr. Walford. On Monday, the closing day, the members visited the mansion at Baddesley, Clinton, and Knowle, Solihull, Meriden, and Berkswell Churches, Mr. Fretton acting as guide.

**THE CAMBRIAN ARCHÆOLOGICAL ASSOCIATION.**—The forty-third annual congress of this association was opened by the Bishop of Llandaff, the president-elect, on Monday night, at the Town-hall, Cowbridge. In the course of his address, Dr. Lewis referred to the many remains of all periods to be found within the Land of Morgan, remarking that, of the British period, perhaps the most interesting monument within the verge of their present resources was the vast cromlech near Duffryn, in the parish of St. Nicholas. It was, he believed, one of the largest, if not the largest, of the Druidical remains to be found in the kingdom. Passing from the British period to the Roman occupation, the president noticed some of those remains more immediately connected with the advent of the Romans, and then proceeded to remark on the remains of the many Norman and English castles which abounded in that and the neighbouring counties of South Wales. Many of the parish churches would be found interesting on account of their peculiar construction and the various styles of architecture; and he particularly referred to the church of St. Iltyd, or Llantwit Major. He also alluded to some recent discoveries at Cardiff Castle. Mr. E. Laws read a paper on "The Black Friars of Cardiff." On Tuesday the members went by road to St. Hilary, Old Beaupre, St. Athans, Fonmon, Penmark, Llan-cavan, and Llantrithyd. They met again at Cowbridge in the evening, when papers were read by Archdeacon Thomas and Mr. J. A. Corbett. The members visited on Wednesday the village of St. Bride's Major, and Ewenny Abbey, the residence of the Turberville family, a Benedictine Priory containing some of the finest Norman work in Wales. A meeting was held at Cowbridge Town Hall in the evening, under the presidency of the Bishop of Llandaff. Mr. Stephen Williams, of Rhyl, read a paper on "The Recent Excavations at Strata Florida Abbey."

**SOMERSETSHIRE ARCHÆOLOGICAL SOCIETY.**—The fortieth annual meeting of this Society will be held at Wells on the 28th, 29th, and 30th inst., under the presidency of the Bishop of Bath and Wells (Lord Augustus Hervey). The annual meeting is to be held in the Town Hall on the morning of the 28th, to be followed by luncheon at the Palace, after which the Palace, Deanery, the Vicar's Close, Hall and Chapel, the Canon's Barn and old Archdeaconry will be inspected. There will also be an evening meeting in the Town Hall. Wednesday's proceedings commence with an excursion

to Rodney Stoke, church and monuments of the Rodney family, Cheddar cliffs, caves, and church, and Wookey church and Manor House. Tea will be served at Somerleaze, the residence of Mr. E. A. Freeman, and in the evening a meeting will be held at the Town Hall, Wells. On the following day, Thursday, the members of the Society meet at St. Cuthbert's Church, in that city, and attend service at the Cathedral, which will afterwards be inspected. In the afternoon Pilton Church and Barn and Croscombe Church and early buildings will be visited, and the proceedings of the meeting close with a reception at the Palace in the evening.

### CHIPS.

The tender of Messrs. W. Grinson and Sons, of Leicester, has been accepted at £4,741 for the erection of a children's hospital in that town. Mr. W. B. Smith is the architect.

Competition drawings sent in by Mr. J. H. Dyson, of Batley, have been successful in obtaining the Corporation contracts for Paisley and Renfrew, which include altogether over five miles of street decorations and six triumphal arches, for the occasion of the Queen's visit to the above-named burghs on the 22nd and 25th inst.

A memorial stained-glass window has been placed in St. Stephen's Church, Saeinton, Nottingham. The chief subject is Our Lord blessing little children, and the spaces above and below are fitted with representations of Our Lord's baptism and the Last Supper. Messrs. Hardman, of Birmingham, were the artists.

The adjudications in bankruptcy reported in Tuesday's *Gazette* include the names of John Pearce Flew, Edith-road, West Kensington, builder; Arthur William Chapman, Bristol, builder and contractor; and Ebenezer Holland, Oxford, builder.

New schools erected for the Bangor school board at Glandada are on the eve of completion, and will be opened this month. Mr. Richard Davies is the architect, and Mr. Evan Williams, also of Bangor, the contractor. The schools have been fitted by Mr. E. H. Shorland with his patent Manchester grates.

A new organ, built by Messrs. Conacher and Co., of Huddersfield, was opened on Sunday at Tong-street church, Dudley-hill, near Dewsbury. The case is of pitchpine, and Gothic in character, and was designed by Mr. George Ogden, of Huddersfield.

Arrangements have been completed for the erection of a memorial chapel and school-room at Epworth, Lincolnshire, the birthplace of John and Charles Wesley. Mr. Charles Bell, of London, is the architect, and Mr. Hy. Kelsey, of Epworth, is the contractor. The site is on the west side of the Temperance Hall, fronting the main street.

The Sussex Archaeological Association, which has its head-quarters at Lewes Castle, held its annual meeting and summer excursion on Thursday in last week, and visited Bayham and Sotney Castle. Mr. W. H. St. John Hope, F.S.A., read papers at the former mansion.

The parish church of Clifford, Herefordshire, was reopened after restoration last week. The plans were drawn by Mr. Evan Christian, of London, and the work was carried out by Mr. Henry Smith, of Wolverley, Kidderminster; the cost was £1,350. The galleries which formerly existed at the west end and sides have been done away with entirely. The outside walls have been repaired, and the nave and chancel re-roofed with red tiles. The chief alteration is the addition of a north aisle, the roof of which is supported by oak pillars. Instead of the old whitewashed walls, the internal walls are lined with freestone dressings, and the oak woodwork of the roof of the nave, which had at the last restoration been shut off from view by lath and plaster, has again been brought into prominence. The pulpit is of oak, and the body of the church is seated with open pews of the same material, the remainder being filled with chairs. There is a chancel screen, also of oak, and a vestry has been provided on the north side, the partitions being of a like material. The nave is paved with wooden blocks.

A morning chapel, organ-chamber, and vestry are about to be added to the north side of All Saints' Episcopal Church, Edinburgh, from plans by Dr. Rowland Anderson, of that city. The style will be Early English, in keeping with the existing building. There has just been completed the carving of some capitals in the nave, included in the original design.

Mr. James McNeil Whistler, the painter, was married at St. Mary Abbots, Kensington, on Saturday, to the widow of Mr. E. W. Godwin, F.S.A.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.] It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 333, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions. Cheques and Post-office Orders to be made payable to PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.). To India (via Brindisi), 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as 10, the minimum charge being 5s. for four lines. The charge for Auctions, Land Sales, and Miscellaneous Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 10 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher. Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Kind volumes should be ordered early (price Twelve shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., LI., LII., LIII., and LIV. may still be had, price Twelve shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print. Cases for binding the half-yearly volumes, 2s. each. Binding cases 2s. each.

RECEIVED.—G. A. W. and Son.—C. G.—J. F.—J. and Son.—F. M. and Co.

"BUILDING NEWS" DESIGNING CLUB.

V. STAINER, Folkestone, RALPH GLADMAN, AN OLD MEMBER, AND OTHERS. (The club will not recommence till after the holiday season; but due notice will be given and the lists of awards will be printed in due course.)—F. CHUBB. (The last sheet of the present series is published this week. Yes, we are open to receive suggestions for the new session, and any serious proposals will be welcomed. Like all good things, our club has had imitators. Never mind, try again.)

Correspondence.

THE R.I.B.A. AND ITS BLACK SHEEP.

To the Editor of the BUILDING NEWS.

SIR,—Is it not high time a prompt action was taken by the Council of R.I.B.A. to publicly dismiss the architects from the Institute who have disgraced themselves in connection with the Board of Works scandal? If not, I fear a blot will rest on the Institute, and many will wash their hands of the Fellowship.—I am, &c.,

H. K. AMSDEN, LL.D.

de Ferns, Richmond.

It is said that at their last meeting the Council of the R.I.B.A. expelled two of the individuals concerned, and severely reprimanded another. No official intimation of the action has reached us, and the above must, therefore, be taken with all reserve. We also hear that one at least of the gentlemen implicated has no means disposed to submit to what he considers exceptional treatment, and that early in the ensuing session it is possible that the Council may be invited to take similar action with regard to other members whom it is alleged have equally disregarded its rules. It also may, of course, be mere gossip.—ED.

PRIESTLEY v. STONE.

SIR,—As the most complete report of the important case of Priestley v. Stone appeared in your journal, perhaps you will allow me to point out that the decision of the Court of Appeal was the necessary result of the practice at present adopted by the building trade. Under the present system the quantity surveyor does not, in fact, make any contract with the builder that he will use due care and skill. He is not, in fact, retained or employed by the builder before he takes out the quantities. He does not make any express statement or representation to the builder that his quantities are correct; and he does not enter into any undertaking or guarantee that they are correct.

If the builder wishes to make the quantity surveyor liable to him, he should insist upon an undertaking being signed by the surveyor, and inserted at the foot of the copy of the quantities upon which he tenders. The undertaking might be in some such terms as these: "In the event of your tender being accepted for the above-mentioned works, I hereby (in consideration of your paying me 1½ per cent. on the amount of your tender and £— for lithography) undertake and guarantee that the above quantities correctly state the amount of work and materials necessary for the completion of the said works according to the plans and specification signed by the architect, and I agree, in case the said quantities are found to be deficient, to pay you the value of the work and materials omitted."

There is one other course which the builder may adopt to protect himself against short quantities. He may insist upon the quantities being made the basis of his contract with the employer. This was the course recommended by Mr. Justice Stephen in his judgment in Priestley v. Stone; and I can testify, from my own experience, that if the contract is properly drawn so as to practically make the employer guarantee the correctness of the quantities, the builder has an ample remedy against the employer for any deficiency.—I am, &c.,

ARTHUR H. SPOKES.

CHURCH RESTORATION.

SIR,—In your remarks on my "essay" on church restoration, you have partially mistaken my meaning. I suggested that those of us ("whose opinion is worth having") should determine some general rules and principles which should be as far as possible made obligatory on those to whom a work of restoration is intrusted, while other questions might be left to opinion. Our paper of "suggestions" can now be either ignored or rendered perfectly useless in the hands of some men who suppose themselves to be "church architects." And in their case, the only way, at present, in which some practical check can be kept on their vagaries, is by the Church Building Societies refusing all aid to any plans reported against by those appointed to examine them.

With regard to criticisms from all sides, they are, of course, to be expected; but while the architect should be by force of character the leader of any work intrusted to him, he may surely be willing to accept good advice; for it is only those who have unbounded confidence in their own superiority to all others who do not occasionally ask for and receive with pleasure the advice of those fitted to give assistance on any special points.

I mean, to give an ancient example, in any such case which might arise, such as "Street" describes about Gerona Cathedral. It was there that a "penta" of the great architects of their day were asked to advise with the designer of the intended new nave. "Street" gives us all their various opinions, and we see the magnificent result of their united deliberations in that grand vault, which is almost without a rival in Europe. We learn, too, from the opinions, that they were no random suggestions of the peculiar taste of the individual, but that they were founded on certain definite and accepted rules and principles, which were quoted by each man as "reasons" for his opinion.

If in our own day we were to try and follow the lead of these old Spanish architects our buildings would decidedly gain, and there would be more of the good feeling and respect for each other's opinion that there ought to be amongst the leaders of the art of architecture.

Moreover, the general public would, without doubt, respect and believe in us more than they now do, at the sight of more willingness to help each other, and why should we not, as in the days of Ghiberti, ungrudgingly (as his Florentine rivals did) admit any undoubted triumph of genius? But, as I think that any such triumph is more likely in the case of a new building, than of any addition in a "19th century style" (so-called), to an ancient building, I cannot bring myself to accept your argument of Rouen Cathedral as being anything but a source of danger and a risk which is better avoided.—I am, &c.,

R. HERBERT CARPENTER.

4, Carlton Chambers, Regent-street, Aug. 11.

STRAINS.

SIR,—Absence from home has prevented my replying earlier to Col. Seddon's letter in your issue of the 3rd inst.

He states my case concisely in his concluding remark, that "each blade of the scissors represents the vertical resultant of all the forces acting on its side of the section under consideration," and in admitting that such a resultant exists, met by an equal and opposite resultant, he admits the existence of shear. In the centre of a beam carrying a distributed load, the resultant of the downward vertical forces is the proportion of the weight carried on the right side of the beam, which is supported by the left-hand abutment, plus the proportion of the weight on the left side of the beam, which is supported by the right-hand abutment. This resultant, which is equal to  $\frac{W}{4}$ , is met and equilibrated by a similar force acting upwards—viz., the sum of two reactions attempting to reach the loads to which they are due.

The theory to which Col. Seddon pins his faith depends upon the idea that reactions are met and equilibrated by the first loads they meet instead of those to which they are due, whereas effects must travel to their causes.—I am, &c.,

G. A. T. MIDDLETON.

SWINDLING ARCHITECTS AND BUILDERS.

SIR,—There is an individual living in Birmingham who is doing a big business in the swindling line among architects and builders. This person called on me some three months ago, represented himself as a traveller for a firm of oil and grease merchants, and said that he lived at Leicester, where he owned two houses; that he was going to leave the firm he was with and going to commence business on his own account, and wanted to build two houses here to cost £2,000. To shorten a somewhat long story, I will here say that I have prepared plans, specifications, and quantities for two houses to cost about this amount. This man came to see me on Tuesday morning, saying he had just come down from London. He travelled about all the week, was in Birmingham several times during the week, and asked to have letters addressed to the Hen and Chickens Hotel. He was in a very great hurry to begin building, but a hitch occurred. The land agent from whom my friend wanted to lease a piece of land asked for references: these turned out unsatisfactory. Then my client took to writing letters, asking me to send him the plans. I asked for money on account. Since then I have seen nothing of my client. I have made a lot of inquiries, and ultimately I went to the detective office at Birmingham. The detectives recognised the man directly from the description I gave, and told me that he had been doing the same thing in Leicester, Leamington, Nottingham, and other places, but that they could not get anyone to prosecute. He got a builder to commence building two houses near Birmingham. When £800 worth of work was done the builder asked for money; a surveyor's certificate certifying for £750 was obtained, and a firm of solicitors advanced £500 to my client. The builder has not had a farthing. I know of other similar cases. Different names, trades, and professions are adopted by my friend in different towns. I have no doubt but that some architect or builder is being "worked" at the present time. If this letter should come under the notice of anyone who is engaged by a stranger, who tells a plausible tale, to prepare

plans, and this should arouse their suspicion, I shall be glad if they will communicate with me at once. I am particularly anxious to have a few minutes' interview with my late client.—I am, &c.,  
JON. ELLIS.  
6, Bridge-street, Walsall, Aug. 15.

#### ARCHITECTURAL PLAGIARISM.

SIR,—In the sister arts of sculpture and painting there is a little word constantly made use of which literally is of little significance, but in the creative artistic sphere speaks volumes. I have in my mind the word "after."

For instance, in painting, an artist treating a landscape subject is largely influenced with the ideal conceptions and mannerisms of a well-known leading artist in that species of composition; but, instead of purloining his ideas, grouping, colouring, &c., and passing them off as his own, the fraud being somewhat too palpable, he immediately and decorously styles his composition "after B. W. Leader, A.R.A.," and nobody's susceptibilities are wounded.

I notice an erection in this neighbourhood, the architectural details of which are to be found at St. Paul's Schools, Hammersmith, the Natural History Museum, South Kensington, and the National Liberal Club respectively. Now, why did not the designer of this edifice say at once "after A. Waterhouse, R.A.," and have completely done with it, if his own ideas possess no self-entity, no individuality, and he was therefore compelled to base his design upon other leading compositions?

It is painful indeed to continually observe these unchecked acts of piracy on the high seas of thought.—I am, &c.,

CHAS. R. GUY HALL, A.R.I.B.A.  
12, Lower Phillimore-place, Kensington.

#### BARFRETON CHURCH.

SIR,—Taking, like many others, much interest in the little Norman church at "Barston," and alarmed by the reports relative to injurious alterations intended to the structure, I went down to the place to see for myself what the truth was. The church is such a perfect gem, and knowing what so-called "restoration" has done, and is still doing, elsewhere, I was extremely anxious for the safety of my favourite.

On calling at the parsonage, and sending in my card, after awhile the professional curer of souls made his appearance with the abrupt and rudely-mannered interrogation, "What do you want?" "Good morning, sir," quoth I. "I am come to see your beautiful little church, and shall be glad to know what are the intentions of its restorers." "You shall not see the drawings," was the reply. "I have been much bothered by people writing to me, and coming to see the drawings, and then going and writing to the papers; I think it most intrusive and presuming for people at a distance interfering with what is simply a parish affair." "I beg to submit, sir," said I, "that the church is one of such great interest, that its safety is rather a national than a purely local matter." "You shall not see the drawings," reiterated he. "You are all ready with advice, but I do not find you willing to give anything else. One letter I received was especially modest—was it yours? Ha, ha! I call it modest, but I mean just the reverse. I shall not show you the drawings; I will only show them to people of the place." This and more was stated with offensive manner, so I advise visitors hereafter to avoid the parsonage, especially if they are "young fellows," or belong to the Society for Preservation of Ancient Buildings, who are especially obnoxious, it seems.

Not having seen the drawings, I cannot say how far the statements are correct as to the pulling down the west wall, and rebuilding it with a turret and chimney, &c. Considering how well the church is built, the pulling down any part of it would be utterly inexcusable. If a bell turret is necessary, it would be better to have a wooden one on the roof and leave the walls intact, and it certainly is not the proper place for a chimney. As to the opening through the wall of the arched recesses at sides of chancel-arch, which were only intended as ornamental panels, this would be a gross vandalism.

But, nevertheless, there are useful and proper things requiring to be done—such as opening

the roofs; the removal of the pulpit from the middle of the west wall, where it is at present, to the north-east end of nave, and the reduction of its size; the providing benches to face eastward instead of the seats now looking north and south; and, for the sake of decency and general usefulness, the building of a small vestry with heating chamber under the chimney on vestry wall. At present a part of chancel serves as vestiary, a thing few would defend. The church possesses the remarkable feature of a solid stone altar. I was assured it was old; but examination convinced me of the contrary. The clumsily moulded top or Mensa was in two pieces, and without the fine crosses which distinguish old altars. I should say it was same date as the stone pulpit, and both modern; though it is very singular a stone altar should have been erected in modern times.

The illustrations of the church in "Britton's Antiquities" are not very correct. Britton shows the walls as being altogether of ashlar stone, whereas the lower half is faced with flints. Since the "Antiquities" were published the roofs have been renewed, and the enlarged cusped lights in chancel restored to their old form.

The dressings are of Caen stone, which in modern times has proved so worthless, yet here is in excellent condition. The building of the church is generally attributed to Hugh de Port, who held the manor 1081; but the style plainly proclaims it to belong to the middle of the 12th century when the style verged on the "Pointed." I should think it was executed at same time and by the same builder as the neighbouring church of Patricbourne, to which it bears some resemblance. This latter church belonged to the Priory of Beaulieu in Normandy in the end of the 12th century, and by which house it was probably built. They both show the hand of an accomplished designer. The east end of Barfreton is a choice specimen of enriched design. At lower part of wall are two arched recesses, supposed to have been intended for sepulchre, but I should say were only ornamental. Over these is an enriched stringcourse; then comes an arcade, part pierced for windows; then over is a rich corbelled stringcourse or cornice terminating at each end with a bold corbel, on which is a seated lion. In the gable is the remarkable wheel-window—shown in Parker's "Glossary"—flanked by carvings of the Four Evangelists (one gone), and on either side niches. The one to the south has in it, on a pedestal, a Norman knight on horseback; the other niche has the pedestal, but the figure is wanting. On the south side of chancel a niche of the arcading has a bas-relief of St. Michael slaying the Dragon under an embryotic trefoil canopy, and the idea is suggested that the other panels also were intended to hold sculpture.

The tradition is that the church was built by a Norman knight, who was fond of hunting, and who thus was thrown from his horse and his life endangered, and that this church was a thank-offering on his recovery, but he hunted no more. Whether the numerous carvings of knights, and especially of those hunting, as shown on the medallions of south doorway, are a confirmation of this story, or only the originating idea of it, is a question.

Two churches in Kent all students of architecture should see—viz., the "Stone" beauty near Dartford and this at Barfreton. This latter is reached by the Chatham and Dover Railway, the stopping place being Shepherd's Well.—I am, &c.,  
M.

#### FLUSHING PIPE FOR BATH.

SIR,—For those of your readers who take a hot bath and like to turn off the dirty water and leave the bath clean, may I suggest the putting a  $\frac{3}{4}$  in. flushing-pipe (connected with the cold-water supply) all round under the bath top, with holes drilled in the pipe at the side towards the bath 2 in. apart, in the manner of the flushing-pipes to the public urinals. By means of a stop cock the bath can be flushed out immediately after the dirty and soapy water has run off, instead of the dirt and soap, which adhere to the sides of the bath, being allowed to dry on, and, with great difficulty, rubbed off by the housemaid next morning.—I am, &c.,  
CHARLES F. MOXON.

#### GREASE-TRAPS.

SIR,—I had occasion a short time since to take up a tin. stoneware drain from a scullery sink. The waste-pipe from sink discharged into an ordinary grease-trap; but this had not been emptied regularly, and the drain was completely choked with grease which had cooled in its passage.

It seems to me that a grease-trap when not emptied aggravates the evil; if this is so, and, if, as I am told, "grease-traps are not often emptied," it is a question if they are such good things as they at first sight appear.—I am, &c.,  
CHARLES F. MOXON.

#### A CORRECTION.

SIR,—Seeing your report, in the BUILDING NEWS of Aug. 3, of the National Competition of Schools of Art, I find you have made an error in naming the church of my measured drawings. I should be "Norton Fitzwarren Church" (recharge screen). Please correct the same in your next issue.—I am, &c.,  
W. FUGE,  
3, Stanley-terrace, Taunton, Aug. 14.

#### STAINED GLASS.

ACTON.—A three-light window in St. Dunstan Church, East Acton, has been filled with stained glass to commemorate the Queen's Jubilee. The work, which represents the Crucifixion, is from the studio of Messrs. Powell Bros., of Leeds.

DRIGHTLINGTON CHURCH, YORKS.—Stained glass has been inserted into one of the aisle windows as a memorial of some members of the Hudson family. The work represents the Act of Mercy, and it has been designed and executed by Messrs. Powell Bros., of Leeds.

#### WATER SUPPLY AND SANITARY MATTERS.

MACCLESFIELD SEWERAGE.—The local board of this town lately advertised an open competition to civil engineers for the best scheme for the interception of the sewage now flowing into the river Bollin, and its purification by the best known method. Mr. W. H. Radford, Assoc. M.Inst.C.E. of Nottingham, is the successful competitor. His scheme is to lay six miles of intercepting and outfall sewers to collect the sewage now flowing into the river, and convey it to an outfall below Prestbury. He then proposes to purify the sewage by irrigation on 159 acres of suitable land, specially laid out and drained for the purpose. The manufacturing refuse, consisting chiefly of soap-suds and dye-water, is also proposed to be dealt with. The population is 39,000, and the estimated cost of work only, without land or easements, is £23,750. Mr. Radford was also lately the successful competitor for the sewage schemes of Newhaven and Beacomthorpe.

#### CHIPS.

The work of restoring the church of St. Peter at Driffield, from plans by Mr. Temple Moore, F.R.S.A. of London, has been intrusted to Messrs. Shepherdson and Son, of Driffield.

The Jubilee hall at Malpas was opened on Tuesday week. The building has cost £1,100, situated in the High-street, and is of half-timbered construction. The chief room on the first floor measures 57ft. by 25ft., and seats 300 persons. Mr. Walter Webb, of Whitechurch, Salop, was the architect, and Mr. Thomas Huxley, of Malpas, the builder.

On Saturday Lady Frederick Cavendish laid the foundation-stone of a new higher grade school at Barrow, which is to be built by the School Board at a cost of £7,000, and which, when completed, will accommodate nearly 1,000 students. Accommodation will also be provided for technical instruction. A banquet was held in the town hall to celebrate the event, and also the unveiling of marble bust of the Queen, the gift of Sir James Ramsden, which has been placed in the town hall.

At the monthly meeting of the West Hartlepool School Board, held last week, it was unanimously agreed to carry out the designs and plans submitted by Mr. G. G. Hoskins, F.R.I.B.A., of Darlington for the Lynnfield schools, to accommodate 1,000 children.

On Thursday, the 9th inst., Lord Wolsley unveiled a series of stained-glass windows which have been placed in Rochester Cathedral by the Royal Engineers, in memory of officers of their corps who have served in the Peninsula, at Waterloo, and the Sudan. The windows have been erected immediately above the tablet which commemorates Charles Dickens and his associations with the ancient city, and form two tiers of lights.

Intercommunication.

QUESTIONS.

[9712].—Theatre Exits.—Can anyone inform me as to the result of an observation made as to the number of people that passed through a door of a theatre a given time? This appeared in some journal or paper a few months ago, I believe.—EXIT.

[9713].—Widening Bridges.—I shall be obliged if one of your readers experienced in the construction of old bridges will inform me whether, in widening such a bridge over a river, the new work should be tied into the old or built without ties to allow for settlement.—OUBIFUL.

[9714].—“Redcot,” Knock, Belfast.—Would the author of the above design (or any other reader) kindly plain the method of construction and means of support the angle over the oriel window, as I presume a pillar could not be admissible, and oblige?—A PROVINCIAL SADER.

[9715].—Western Towers.—Are there any examples to be seen near London of old western towers opening to the nave?—STUDENT.

[9716].—Load upon Roof Truss.—At what points could the load be distributed, and how is it composed? Any particulars will be received thankfully by—T. E. R.

[9717].—Fence.—Can an adjoining tenant call upon its neighbour to repair a railing which is in a bad state of repair and belongs to him? How can an aggrieved party act?—A TENANT.

[9718].—Characteristics of Masonry.—What are the characteristics, if any, of 12th-century masonry? Are the mortar joints wide, and what is the general kind of mortar used? Do the joints and stone-laying differ at all from the work of the preceding century?—U.

[9719].—Easter Sepulchre.—Can any reader tell me in what position this generally stood?—U.

[9720].—Renewing Old Plaster.—Will any of our readers kindly tell me any way in which I can treat old used plaster (models, &c.) so as to use it again as before?—AGNEW.

[9721].—To Estimate Brickwork.—Are there any tables to be had for estimating brickwork by simply multiplying the area by a multiplier for any thickness? The ordinary methods used by surveyors are tedious to the poor people, as it becomes necessary to reduce the various thicknesses of walls to  $\frac{1}{2}$  bricks, and then divide by 2, which is laborious. Thus, in a  $2\frac{1}{2}$  brick wall it is necessary to multiply the superficial by 5 to bring it into  $\frac{1}{2}$  bricks, and divide by 3 before the final division is made, or to have two columns, one for  $\frac{1}{2}$  brick walls and one for brick walls, under which the quantities are placed. The latter is the usual and easiest plan, as under two columns for one brick and  $\frac{1}{2}$  brick, any thickness of wall can be abstracted. For one-brick walls the reduction to  $\frac{1}{2}$  standard thickness is made easily by multiplying the area by 2 and then dividing by 3; but then the independent division by 272 has to be gone through.—G.

[9722].—Sheet-Iron Chimney Shaft.—In designing a chimney shaft for a district where the atmosphere is free of any acids from surrounding manufactories, I have decided to use sheet iron, on account of its much lower weight on foundation as compared with masonry; but whether I should have steel or iron plates is a consideration. I have procured a “Bancroft’s Flat Chimney Shaft” (construction) from seeing it noticed in the BUILDING NEWS as one of the best hundred technical books, and in examples there given I find this method of construction has fairly passed the experimental stage, but would like the opinions of your correspondents as to the comparative durability of steel and iron. I may add that I have estimated the cost of painting iron every ten years against the first greater cost of masonry, taking into account the interest on my calculations, but should like to have the opinions of your correspondents on this point.—IRON CHIMNEY SHAFT.

REPLIES.

[9723].—Shingled Spires.—Shingles were from 8 in. long, and 4 to 6 in. wide, and an inch thick, tapered to one end and fastened to rough boards by pins. In the 12th century stone shingles were commonly used. Water-tel oak shingles have lasted for half a century in Normandy several houses are shingled. The Salisbury Cathedral was covered with wood shingles at the period out from the New Forest. I am not acquainted with any ancient example of a shingled spire, though there are three spires in Hampshire, Nursling and Highclere church, have structures covered with wooden shingles that have stood well.—G. H. G.

[9724].—Acoustics.—No specific rules are followed by architects, though square corners, high roofs, and reflecting surfaces are to be avoided.—G. H. G.

[9725].—Acoustics.—In reply to “Architect,” I would say that the limits of comfortable hearing space are as follows, as proved by experiments:—In front of the speaker, 75 ft., and 50 ft. on each side of him. The wall of the orchestra or platform should be elliptical on plan; the reason for this being that sound should never be at a plane at right angles, otherwise it will be reflected as an echo. The same rule applies to the ceiling, and should be horizontal. The parts adjacent to the walls should be brought down in a curve. Further, the plane of the wall facing the speaker should be broken up as much as possible, as by recessed doors and windows, projecting gallery, columns, &c., as they tend to disturb the sound waves and so prevent them from being reflected. Avoid all projecting surfaces on the side walls, as they afford so many shields, as it were, to ward off the sound in another direction. With regard to curtains, &c., still, none at all, as they tend to absorb the sound and produce a deadness of feeling fatal to all music. Over the dimensions of the hall be, avoid a large space overhead, for it will absorb part of the sound and turn the rest in the form of an echo. The floor of the hall can be slightly inclined with advantage, but this is only necessary for the purpose “Architect” states.—J. NIEL.

[9697].—Haddon Hall.—Details of woodwork of above are to be found in “B. N.” for April 2 and 16, 1875, and sketches of portions of the building in “B. N.” for July 6, 1883; Oct. 5, 1883; July 11, 1884; and Feb. 11 and 18, and March 11, 1887.—S. S. P.

[9699].—Refectory.—An apsidal-ended refectory is not to be seen in England. The refectory was often placed on the south side, and was connected with the kitchen. At Netley it is below the dormitory, and is placed on the east side; the same position is found at Durham and other places.—G. H. G.

[9700].—Quality of Woodwork.—The extract “Fairairton” gives from “Gwilt’s Encyclopedia of Architecture” belongs to a by-gone age, and is wholly out of place at the present time. “The timber to be of the best Dantzic, Riga, or Memel yellow fir” means that all unwrought wood in a building shall be cut from hewn timbers shipped from one or other of these ports, as was the custom at the commencement of this century. To carry out such a system now would about double the cost of the timbers in work, especially so if cut free from sap, which would be possible if the dimensions were not large. The mention of “yellow fir” shows that the specification was framed in London or in south of England, for in all other parts of the kingdom it is called “red fir.” The exclusion of timber from Scotland reflects the old days when wood shipped other than from our colonies was a taxed commodity, and paid duty at the port of landing—a time when it was possible for the native timber of Scotland to compete with that of the Baltic, a state of things that has not existed for the last half-century. The exclusion of American fir was natural, as it meant the Canadian spruce of our day, which does not hold a very high position as a building timber, although largely used in London and along the West Coast of England. The exclusion of “Swedish fir” meant hewn timber of that shipment, a soft species of firwood roughly hewn and made, coming to hand with the natural taper of the tree preserved in the log. It did not refer to the high-class shipments of sawn planks, deals, and battens, which form the staple of the trade to-day, for they were then unknown. There is certainly a good deal of American timber now used in building. I give a note of this in the case of spruce, as above; but pitchpine timber from the United States is a prominent instance. This wood, from its size, its high quality, splendid manufacture, and low cost, finds its way to every town and village in the land. Before this timber the older shipments from Dantzic, Memel, and Riga have had to retire, and such has been the rapidity of this retrograde movement that in a few years it is probable that they may disappear altogether. “Fairairton” will, from the above, be prepared for my remark that the above clause from Gwilt’s “Encyclopedia” is not now generally applicable, and that it ought to be modified. The manner in which it should be modified depends upon the character of the building of which the timber is to form a part and to the locality in which it is to be erected. It might be described that all heavy timbers—say, those having a greater width than 11 in. and a greater thickness than 4 in.—should be of such timber, or of pitch pine. The architect in the latter case being assured in his own mind of its durability, all light timbers might be described of the same wood or of good or given shipments or marks, of Swedish or Finland sawn planks, deals, and battens. The latter, owing to the enormous saving in cost to the contractor, would most certainly be used. If the timber was the “best” of its several kinds it would be practically free from shakes, large knots, and other defects, and such a description following would be superfluous, more especially in connection with the smaller timbers cut from Swedish or Finland sawn goods. It is very rarely, indeed, that the best quality of the latter goods are used for timbering purposes, as the second and even the third qualities are good enough for all ordinary purposes. In practice it is a fact that an enormous volume of sawn goods, of qualities and brands inferior to the above, pass into consumption, and that they form the staple of the carpenter of to-day. The reservation of “best” might be adhered to with regard to the larger timbers; but if rigidly enforced the short average lengths of this brand of good might offer a difficulty. There is no such thing as building wood being entirely free from sap. No qualities or brands are selected with this view—it would be better to allow some latitude in this direction. For instance, it might be stated that the sap should not encroach on the edge of any piece of timber above one-half or three-quarters of its thickness. In the case of pitch-pine timber, it is much less difficult to obtain the wood free from sap than in the case of Baltic timber, Memel timber, the toughest and most durable of all, being especially subject to this imperfect and perishable wood.—W. STEVENSON, The Park, Scarborough.

[9704].—Employers’ Liability Bill.—This Bill stands over until the autumn session, and so it may be much amended before becoming law; but if an accident happens to the workman of a contractor by reason of a “defect in the condition or arrangement” of the plant or machinery which is provided by the owner, and which is not discovered or remedied through the negligence of that owner or his foreman, then, as the Bill now stands, the owner will be liable as if he were the actual employer of the workman.—F. W.

[9706].—Honours Exam. in Building Construction.—“Veritas” will possibly find all the assistance he requires from “Simple Practical Methods of Calculating Strains on Girders, Arches, and Trusses,” by W. E. Young (Macmillan), which is free from “difficult mathematical calculations” as is possible, and for practical demonstration I do not know that he could do better than refer to “Building Construction” (Rivington). If he refers to your issue of Feb., 1888, he will gain valuable information upon the elementary consideration of girders.—GEORGE WM. USILL, Assoc. Mem. Inst. C.E.

[9709].—Belgium.—I have spent two holidays in Belgium, and if the tastes of “Iota” run in the direction of quaint cities, galleries of old and modern paintings, grand town halls, spacious churches of the 15th, 16th, and 17th centuries, carillon music, or pastoral scenery, he has a rich storehouse to explore in that little country. The characteristics enumerated are best seen in Flanders; if he wishes for hill scenery and a tinge of Teutonic rather than Flemish influence in the people, buildings, and surroundings, a few shillings and two or three more hours spent in a train will take him to Namur or Liège. The first trip I made to Belgium was in 1873, when I took the Great

Eastern Railway route via Harwich to Rotterdam, returning by Antwerp. A month since I revisited the country, and decided to try the General Steam Navigation Company’s boat, which proceeds direct from Irongate Wharf, E., to Antwerp. Travelling with a companion, we exhaustively did the sights of that city, and visited Malines, Louvain, Brussels (where we stayed four days, one of which was devoted to a coach-ride over the field of Waterloo), Ghent, Bruges, and so back to Antwerp. In each town we went up the tower of the cathedral or Town Hall in order to gain a bird’s-eye view of the place and its neighbourhood, and so triangulated with field-glass the whole of the limited and flat area we visited; at least, two other spires, already seen, or to be afterwards inspected, being visible from each point. We visited the museums, churches, town-halls, and, indeed, all buildings and places set down in guide-books as worthy of note; while, by restricting our tour to a small compass, we were able to “do” that little district thoroughly and pleasantly. French is spoken by the middle and upper classes, and English in the hotels and some shops; but, except in Brussels, the lower classes speak Flemish and a few words of French. Two persons can carry out such a trip more economically than one, as the aid of a concierge has to be sought to see the interior of many buildings, and then a franc is thankfully accepted from two where a half-franc would not go down from the single visitor. Most of the pictures worth seeing in the churches are veiled, except on Sunday mornings during service, and a fee must be paid the sacristan to draw the curtain. Hotel charges are much lower than in England, railway fares are the lowest in Europe, with a sensible reduction on return tickets, and a trip can be carried out very cheaply. Waterloo is reputedly the expensive item in the programme, but the whole outlay per head of a party does not exceed twelve francs, luncheon excepted—eight francs for coach, including driver, a franc to guide, ditto to visit the Cotton Museum, and half-franc each for the church at Waterloo, the farmhouse at Hougomont, and the keeper of the Lion Mound; and ten shillings would not be considered dear for a twenty-four miles drive through the Parc de Cambrai and Forest of Soignes, even without the historical interest of the field, although the paved roadway is execrably jolting. At Antwerp the west front of the Cathedral is undergoing restoration; the old details are being faithfully reproduced, but at present the new masonry is glaringly white. The unfinished south-western tower, the buttresses of which are in a threatening condition, is being refaced in stone and strengthened. The fountain in front of the Hotel de Ville, replacing the Tree of Liberty which died, is a bold representation of the slaying of the Brabant giant; the conception is bold but coarsely executed, and the effect of water gushing from the severed trunk, head, and wrist of the monster is repulsive. The group forms the apex of a cairn of large stones rising directly from the pavement of the Grande Place, having no trough or basin to inclose it. At Louvain, besides the town hall and church of St. Pierre, one should visit the less-known University, which contains a good collection of paintings, chiefly modern portraits of benefactors and historical scenes, and a large library. The building itself, formerly the Halles, contains some good 14th-century stonework. At Brussels, the new Palais de Justice, designed by M. Joseph Poelaert, which has been in course of erection since 1866, and is yet unfinished internally, will repay careful study and comparison with Street’s work in the Strand. The Brussels building has the advantage in site, being placed on a plateau overlooking the city; the outline is compact and effective, but the mixture of all Classic styles, from Assyrian to the newest Renaissance, is distressing; the central dome is not sufficiently massive to form a crowning feature to so lofty and imposing a pile, there is a uniformity in the planning and details of the courts in marked antithesis to our Law Courts; and the proportions of the central hall, so far as they could be judged in the maze of scaffolding, are too lofty and narrow to give satisfaction, although the arrangements will be more convenient than those of our Law Courts. Opposite the unrivalled Hotel de Ville an immense pretentious building is being cleared of scaffolding, in which the characteristics of the town hall facing it, and those of Louvain and Bruges, are reproduced with some dexterity, but the effect is too “busy.” A new Post-Office near the Theatre de la Monnaie is being roofed in, and will afford more ample accommodation than the present one, a desecrated Dominican Church; the style of the new building is Free Renaissance, and M. de Curte is the architect. At Ghent the Hotel de Ville and Cathedral are undergoing external restoration. The Gothic portion of the former building was scraped down sixty years ago, and is now being retouched; the south transept of the cathedral is being purged of Renaissance details, and the interior of nave is partly blocked up by scaffolding for the removal of whitewash from walls and the completion of the south triforium. Bruges, even more than Ghent, is a city of brickwork; the celebrated Belfry (which, although picturesque in outline, is too lofty for the Halles to which it is attached, and like the tower of the Hotel de Ville at Brussels, is not centrally placed), the cathedral (which has a hideous modern castellated tower) and the great church of Notre Dame are of brick; but neither here nor anywhere else in Flanders could I find an example of “Flemish” bond in old or modern brickwork; all was English bond. To “Iota” I would say: Take as little luggage as possible: a guide-book—my friend and I had two, the one Baedeker, the other Murray, and exchanged notes; and opera or field-glasses are indispensable additions to the necessary linen and change of clothing. I may add that I left London Bridge on Saturday, July 14th, and returned on the Wednesday week, the 25th; we lived well at hotels, with two meat meals per day, freely utilised trams and rail, and never grudging a fee to see anything of interest. My expenditure (as previously estimated) for the eleven days, including first-class steamboat passage (26s.), and third rail, was exactly £7.—EAST ANGLIAN.

The members of St. Alban’s Archaeological Society visited last week Wheathampstead Church (the tower of which is now being restored by Mr. J. O. Scott), under the guidance of Canon Davys, and St. Paul’s Church, Walden, where Mr. S. Flint Clarkson acted as cicerone.

## LEGAL INTELLIGENCE.

**SIMPSON V. NEILL.**—WHAT IS A "CERTIFICATE"?—(Liverpool Assizes, Aug. 10, before Mr. Justice Grantham.)—This was an action by the plaintiff, Joseph Simpson (trading as Simpson and Co.), Darlaston, who was the chief contractor for the Liverpool Exhibition building in 1886, against Messrs. Neill and Sons, Manchester, to recover £7,000 for work and labour done as sub-contractor for the defendants at the new Liverpool Exchange Station of the Lancashire and Yorkshire Railway Company. The question for his lordship was as to the construction to be placed on terms in the agreements between the parties. The defendants were the contractors for the new Exchange Station, and the plaintiff sub-contracted with them to do ironwork. As regarded the present action, all the matters in dispute between the parties had been narrowed down, and the question for his lordship was whether a certificate from the railway company's engineer as to the work being done was a condition precedent to the plaintiff recovering the amount claimed; and whether a document put in was such a "certificate." The company's engineer (Mr. Hunt) had certified that the amount due by the defendants to the plaintiff was £2,100, and it was argued for the defendants that the engineer's certificate now produced was conclusive in the action as to the amount which could be recovered by the plaintiff, but the plaintiff must obtain a certificate himself. All disputes between the contractor and the company were to be settled by the appointed arbitrators, Sir John Hawkshaw and Mr. Sturges Meek, and in the agreement between the plaintiff and the defendants it was stated that the arbitration clauses applied. The defendants replied that the plaintiff in the present case could not appeal against the company's engineer's certificate as to the amount to which he was entitled for work done. The defendants paid this amount into court. The plaintiff asked his lordship to say that the document produced was a sufficient certificate to enable him to go to the arbitrators to have settled the final amount which he could recover. His lordship said it was a strange thing that in cases of large contracts it invariably happened that some loophole was left in the documents for a legal question to be raised. So far as the certificate put in was concerned, it was a certificate on which the plaintiff could rely as a certificate given by the engineer at the completion of the work. He also thought that the arbitration clauses applied. His judgment would be for the plaintiff upon the question whether or not a certificate had been given, and whether or not the parties had a right to ask the company to refer the matter to the arbitrators to see what further amount was owing to the plaintiff. Judgment for the plaintiff for £2,100, with costs, was then given.

**EMPLOYERS' LIABILITY ACT.**—**CLAXTON V. MOWLEM AND CO.**—(Court of Appeal, August 7. Before the Master of the Rolls and Lords Justices Lindley and Bowen.)—In this appeal case the plaintiff was in the employ of the defendants, the contractors for the sewage works at Barking. The plaintiff was engaged with other workmen in a barge unloading ballast. The ballast was put into buckets, and the handle of each bucket was put on to a hook attached to the chain of a steam crane, and then raised on to the bank, at the same time an empty bucket being lowered into the barge. A banksman stood on the bank and gave the signal to the driver of the crane to raise or lower the bucket. The hook to which the buckets were attached was an open hook, without a catch. On the occasion in question the men in the barge attached the bucket to the chain, the banksman called to the driver of the crane, "Lower away," and the driver lowered quickly, so that the bucket coming up struck the bucket going down, thereby loosing it from the hook, and it fell on to the plaintiff. The plaintiff contended that there was a "defect in the condition of the plant," as the hook had no catch to prevent the bucket from falling off, and also that the accident was caused by the negligence of the banksman, who had "superintendence intrusted to him." He also relied upon Sec. 1, Sub-sec. 4, of the Employers' Liability Act, 1880. The jury in the County Court found for the plaintiff for £200. The Divisional Court held that there was no evidence to go to the jury, and entered judgment for the defendants. The plaintiff appealed. The Court dismissed the appeal. The Master of the Rolls said that there was no evidence to go to the jury. As to the alleged "defect," the evidence given for the plaintiff showed that this sort of hook was always used by contractors in work of this kind, and no evidence was given of any accident having ever happened. It was impossible under these circumstances for the jury to find that there was a defect within Sec. 1, Sub-sec. 1, of the Employers' Liability Act. As to Sec. 1, Sub-sec. 2, the banksman had no "superintendence" over anyone; he was an ordinary workman engaged in manual labour. The foreman was the superintendent, and there was no evidence of negligence in him. Then Sub-sec. 4 was relied upon. The banksman, however, gave no instructions to anyone; he merely gave notice.

But, assuming that he did give orders, a person who was told to do a particular thing was not "delegated with the authority of the employer." If there was any negligence here, it was in the banksman, and he was nothing more than a fellow-servant. The Lords Justices concurred.

## Trade News.

## WAGES MOVEMENTS.

**DUNDEE.**—A largely-attended meeting of Dundee joiners was held on Friday to consider the replies that had been received from the employers with reference to circulars sent them a week previously asking for an increase of wages, and demanding that the standard rate in town should be 7d. per hour. The majority of the masters intimated that they would give the increase asked, but others gave no answer. It was resolved that work should be stopped after Saturday in those shops where the increase was refused.

## CHIPS.

The congress of the British Archaeological Association will be held at Glasgow the week after next, commencing on Monday, the 27th inst.

A new vicarage house for the Rev. T. D. T. Speck has just been erected at Langtoft, East Yorks, from designs by Messrs. Demaine and Brierley, of York. The contractors were Messrs. George Shepherdson and Son, of Driffield.

The Metropolitan Board of Works have resolved to apply to Parliament in the Session of 1889 for powers to undertake as a metropolitan improvement the widening of High-street, Vauxhall, Nine Elms-lane, Battersea-park-road, and York-road, at an estimated net cost of £207,400, and also the widening of Jamaica-road, Bermondsey, at a net cost of £51,500.

Operations are now being carried out in Church-street, Liverpool, for the erection of premises which will complete the "Bon Marche" establishment. On the 2nd ult., the demolition of Glasgow House was commenced; the old building was entirely removed in 23 days, and it is expected the "Bon Marche" pile will be completed in about 17 weeks. The site was handed over to the contractors (Messrs. W. Tomkinson and Sons) on the 26th ult., and building operations were actually commenced on Thursday. The new premises are being built entirely of stone and granite, and the whole of the floors are to be fireproof, and the shop-front will be of plate-glass 130ft. long and 15ft. 6in. high, in a continuous line, unbroken by the usual columns or piers. The architect is Mr. Walter W. Thomas, M.S.A., 25, Lord-street, Liverpool, who also rebuilt Lewis's, in Ranelagh-street, in the same city, after their great fire, within seven months, a building which was illustrated in our issue of the 6th January last.

The Archbishop of York on Tuesday consecrated the new church of St. Hilda, Whitby, which has been erected at a cost of £12,394, from plans by Mr. Robert J. Johnson, of Newcastle-on-Tyne. We illustrated the building by elevation and plan in the BUILDING NEWS for October 23, 1885. Messrs. Padbury and Son, of Scarborough, were the builders.

Various works of internal improvement have just been completed at St. George's Hall, Belfast, including the enlargement of the stage and of the galleries, and the raising of the pitch of the seating of the latter. The work has been carried out from the designs and under the directions of Mr. F. W. Lockwood, Eagle-chambers, Belfast, the contract having been taken by Mr. Isaac Hewitt, of the same town.

The Wiltshire Archaeological Society held its annual meeting last week, Calne being selected as the headquarters. On the closing day, Friday, Broomham and Mellisham churches, Lacock Abbey, and Bowood House were visited.

The foundation-stone of new classrooms, now being added to the Congregational Church at Crewe, were laid last week. The contract for building has been taken by Messrs. Wood and Son, of Willaston, at £520.

Sir Charles T. Newton has resigned the Yates Professorship of Archaeology at University College, London. The appointment, for which application should be made before November 1st, may be made for five years. The endowment amounts to £450 per annum, in addition to a share of fees; but the professor may be required to provide stipends for assistant lecturers.

A new workhouse has been erected at Milton, Sittingbourne, and special attention has been paid to the ventilation, which is carried out on the Boyle system, the latest improved form of the self-acting air-pump ventilator being employed for the extraction of the vitiated air, the fresh-air supply being admitted by Boyle's improved air-inlets.

## Our Office Table.

CARDIFF has been selected as the centre for the provincial meeting of the members of the Society of Architects, which will be held during the week commencing Sept. 24th. Visits will probably be made, among other places, to Cardiff Castle, Llandaff Cathedral, the Docks and Steel Works, Threpstone Castle, Tintern Abbey, and Raglan Castle; and at the ensuing meetings discussions will take place on such subjects as "How can the Society be Benefited by its Country Members?" "The Architects' Registration Bill," &c. Members intending to take part in the meetings are requested to address either the local hon. secretary, Mr. F. Baldwin, 17, Church-street, Cardiff, or the president, Mr. W. H. Seth-Smith, at St. James Hall, Piccadilly, before the 30th inst.

At the closing session of the meeting of the British Medical Association, held in Glasgow last week, several papers were read dealing with various aspects of the problem of sewage disposal. Dr. Littlejohn, medical officer of health for Edinburgh, who presided, remarked that, notwithstanding the wretched manner in which the sewage at Leith and the southern suburbs was disposed of by being cast into the Forth, and the extremely offensive vapour evolved from sewage when brought into contact with salt water, they had never been able to prove increased mortality resultant therefrom. Dr. Russell, medical officer of health for Glasgow, deplored the mode in which the pollution of that city and its suburbs was transferred to the Clyde. Dr. Alfred Carpenter of Croydon, recommended sewage farming on the broad irrigation system, as applicable to a water-closet towns without exception, and Dr. Drysdale, of London, advocated similar view, quoting the results of agricultural utilisation in Berlin, Paris, Birmingham, and Nottingham in support of his opinions; and Dr. J. T. Dyke Merthyr Tydvil; Mr. Whitelaw, Kirkintilloch, and Dr. Murray, of Forfar, bore testimony to the success of downward intermittent filtration in the towns for which they are medical officers of health.

MR. WALTER CRANE delivered the last of course of University Extension lectures in the Sheldonian Theatre, Oxford, on Friday evening, the subject being the educational value of art. He said that one of the means of making education interesting was too much neglected, namely, that enough account was not taken of the eye, its sensitiveness to impression, especially impressions of beauty. This was not recognised, as a rule, in schools, and the consequence was the too frequent insensibility to harmony and proportion in visible things which was sometimes met with even along with a high degree of culture. We were hearing much of technical education, but if that merely meant a specialising of putters-on of pin heads or a training for a machine-minder, it did not feel much enthusiasm for it. What they thought how closely interwoven with the warps of history and humanity were the golden threads of art it hardly seemed necessary to gauge the educational value of art, for itself was an education.

**Architectural Association.**—Visit to St. Dunstan's College, Catford Bridge, Aug. 25th. Postal order for 1s. 6d. to Mr. Ernest S. Gale. Meet Cannon-street 2 p.m. Members desiring any alteration of the addresses in the Brown Book are requested to send notice of same to Mr. Hampden W. Pratt, 6, Duke-street, Adelphi, before the end of August.

**Holloway's Ointment.**—This cooling Ointment, perseveringly rubbed upon the skin, is the most reliable remedy for overcoming all diseases of the throat and chest. Quins, relaxed tonsils, sore throat, swollen glands, ordinary catarrhs, bronchitis, may be arrested as soon as discovered, and every symptom banished by this simple and effective treatment.

**HYATT'S LENS and "SEMI-PRISM" LIGHTS** for PAVEMENTS, STALLBOARDS, ROOFS, TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

**WM. OLIVER & SONS,**  
MAHOGANY, WAINSCOT, WALNUT,  
TEAK, VENEER, and FANCYWOOD  
MERCHANTS,

120, BUNHILL ROW, LONDON, E.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

# THE BUILDING NEWS

## AND ENGINEERING JOURNAL.

VOL. LV.—No. 1755.

FRIDAY, AUGUST 24, 1888.

### THE ARCHITECT AND ART CRAFTSMAN.

A REMARKABLE difference may be seen in the work of architects, not only in the manner they begin to incorporate their ideas, but in the methods they use to carry out their intentions. We have heard builders declare that they would twice as soon work under one architect than under another. Mr. Five-per-Cent. has the reputation of seeing to everything himself; his drawings are minute and descriptive, he furnishes details for everything, he will have samples and specimens of manufacture brought to his office, his superintendence is thorough and unremitting. Mr. Five-per-Cent. leaves everything to the clerk of works or foreman of the builder, after the drawings are prepared, which are done in a mechanical sort of fashion, and the contract is entered into; the rest of the work is looked upon as a sort of operation akin to machine brick-making. With the first of these the architect's work is not finished till the whole building has been turned out of the contractor's hands, and the exercise of skill and artistic thought is just as much necessary in drawing the profile of an architrave moulding as it is in designing the plan. According to the second, the architect's labour is complete when the contract has been signed. We wonder when we look down the lists of readers which are weekly published, to find the diversity that exists, why some have charged thirty or even fifty per cent. more than another for the same work, tendered on the same bill of quantities, and on the same drawings; but this disagreement in estimating will not be surprising to any one who knows the different requirements of architects, and how only one or two out of a dozen who tender know by experience the real meaning and intention of the architect. Smith and Brown are two competitors: the first has had transactions with an architect on previous occasions, and has learned from experience what such entries as "timber to be of the best Dantzic, Riga, Memel," "no American or Swedish fir to be used," and "everything to be of the best quality and approved by the architect," really mean; while the other has interpreted them in a more honest and literal manner. The experimental or "try-it-on" tactics of Smith have been of service to him; he knows that a specification and bill are simply documents—nominal instruments required in making a contract—and attaches no weight to them. Other builders soon come to know the architect's tastes and predilections, and they make a considerable discount when they see a Swedish or some other inferior deal can be substituted and details departed from. There are obviously two ways in which architects set about their work. Mr. Five-per-Cent., under which appellation we may describe the ordinary practitioner, deals with building in a very business-like way. He prepares regulation plans without taking the trouble to inquire if some newer and better arrangement can be adopted; he leaves the specification and all his details to the surveyor, who prepares the quantities, or to the builder who undertakes the contract: these things much beneath his notice. Mr. "In-the-Work" proceeds very differently. He does not draw a line of the plan till he has made himself acquainted with the best buildings of the same kind; he is not content with published precedents, but personally examines buildings, and, acting on his judgment, produces the most perfect

design of which he is capable. This he elaborates; instead of leaving them to chance and the surveyor, the details are carefully studied; upon each of them he devotes personal attention; he makes inquiries, examines materials and manufactured goods. Not content with these preparatory labours, while the building is in progress his mind is still directed to the task of improving; he inspects every piece of work before it is fixed, and every moulding passes his scrutiny. Stock-in-hand patterns and ready-made goods do not suit him; everything, down to the grates and fenders, must be made to order from special designs. The effect on the building trades of each of these modes of dealing with work is evident. Mr. Five-per-Cent. does not care one iota for the British art workman so long as the labour is performed with ordinary skill, as he does not trouble about little things; the artificer has only to turn out as much work as he can, and to avoid glaring mistakes. Under the second regime there is competition in skill—the workman is selected for his competency in his trade and his artistic capabilities. We see the bricklayer and mason striving to do his best in brick-setting and gauged work, the joiner careful of his mitres and finish of his framing, the plasterer, the smith, the plumber, and painter each in his way anxious to exhibit good workmanship. The really competent craftsman is the loser under the first system; he feels that all his training and ability are thrown away in competing for buildings in which the chief idea is a low contract performed against time; he has no chance in the market with apprentice hands and slop-workers. The connection between architect and workman is completely severed; the architect himself need not be an artist. Let us trace the results in the trades of the mason, joiner, and decorative artist.

In the mason's trade the results have been disastrous. Some years ago we remember German masons were sent over to do the work which English masons would not do under the trade-union rules. The fixing of masonry by piecework enabled the skilled hands to earn £3 or £4 per week, but the Union interfered, and prohibited some men from earning what they could by their skill. As skilful masons are less in requisition, so the trade becomes recruited by the entrance of a number of hands who are indifferent masons. Trade-unionism has simply protected mediocrity and limited the hours of work. Masonry is now very much curtailed in consequence. Solidity is very rarely met with, all because good work has not been encouraged by architects, and a number of mechanical and ill-trained masons have glutted the market, whose motto seems to be "to do as little as they can for a day's wage." The quality of the work turned out tells its own tale. Cornices are now built up with the least quantity of stone, the labour on plinths and sills is reduced, scantlings are cut down to the finest, and joints and beds are often scamped.

Quite as much difference is shown in joiners' work. We all know what a large proportion of prepared joinery comes from America, Sweden, and other parts. The English joiner has now to compete with machine-made work. So long as people admire mechanical accuracy, smoothness, and rapidity of execution, machine joinery will be in quest. But the architect has it within his power to encourage the production of a class of work in which other and superior qualities are shown, in which the skill and artistic ability of the worker are called out. The superficial observer sees little difference between them. Mr. Five-per-Cent. is well satisfied with machine-made doors and framing. But the character of the old work was in its being hand-wrought. Take the Mediæval joinery: the quaint stop moulding in the stile is one of the features that give the

framing its interest; later on, the stop was worked on the rail. The mitre joint is pre-eminently a modern contrivance. The old framing, with its narrow panels, was full of mortising and tenoning; screws and nails were not used—only the wooden trenail, and much labour was expended on this kind of joinery. Then we have the mouldings struck in the solid, not applied, and the old "planted" work which was superseded by panel work; the grain of the wood was observed in all the mouldings, which ran with it, never across it. We do not say, Go back to these methods of framing; but let us by all means get the joiner to exercise his own ability—to think for himself, and not to trust implicitly to guides and other machine appliances. The large importation and use of ready-manufactured joinery must be attributed to the architects of the Five-per-Cent. school, who are intent upon shortening their labour in design. Hence we have the outpour of catalogues of doors, dadoes, sashes, and shutters, pulpits, pews, benches, lecterns, and other joinery. Some of these designs are creditable, and in merit surpass the ordinary architect's work; but they are made without a distinct purpose in view. We cannot but feel they lack congruity and fitness for their position. Each artist has designed his work in his own shop. Instead of being made for the building, the furniture looks out of harmony with it. We have seen bare churches fitted with desks, benches, and pulpits that have been chosen from a manufacturer's stock—everything looks out of joint. Even glass painting is done in the same fashion: every window has its own glass painter, several decorative firms have been turned loose into the edifice, and have revelled in ideas and colours of their own. How different to the mode of doing things in the old Mediæval times, when the artists were associated together, and a common sympathy for art prevailed! The root of the error is in separating architecture from the sister arts. We now look upon a building as quite distinct from its fittings and its decoration. Unlike the Parthenon, which was adorned by painting and sculpture, or the Mediæval edifice in which these arts were fully enshrined, it is regarded as being complete. The old architect carved and painted his edifice; his windows were filled with painted glass, his capitals were carved into beautiful foliage, and saints and historic legend tenanted the niches and spandrels of the arches. The early painters found their chief occupation in painting triptychs, tabernacles, and roofs. The ordinary fittings of houses and churches were painted and carved. Not only the Mediæval artists, but the Italian artists of the 13th, 14th, and 15th centuries, exercised their artistic functions in the painting and sculpture of buildings; and they would no more have thought of expending their abilities on structures built by contract, designed without any reference to their adornment by sculpture, or fresco or glass, than they would have tolerated contracts for these objects by separate artists in the manner so common in our own day.

### LAND SURVEYING.—V.

TAKING ANGLES.—SURVEYS WITH THE THEODOLITE.

IN chain surveying it is necessary to divide the district or field into triangles, and to run two or more base lines upon which to construct a system of triangles or intersecting lines near the centre of the survey; but with the use of angular instruments this method is not necessary: the land may be divided into quadrilateral figures or trapeziums with the boundary lines. We shall now show how a plot of the shape given in plan 8 can be surveyed by the chain and theodolite, or any angular instrument. The plan we give has the chain lines numbered in the

sides of a triangle are to each other as the sines of their opposite angles, so that any side is to the sine of its opposite angle, as any other side is to the sine of its opposite angle. To find the sine of an angle, begin the proportion with the side opposite to the given angle, and having the sine, the corresponding angle can be found in any trigonometrical table. To find a side, begin the proportion with the sine of the angle opposite the given side. Let us take an example under case 2, where two of the angles are known, and the side opposite to one of them. The given side of the triangle let us call  $a$ , opposite  $A$  the given angle,  $B$  the other angle. Then,  $\sin A : a :: \sin B : b$  the side required, or  $\frac{a \times \sin B}{\sin A} = b$ .

By assuming any length in chains or feet, the given side  $a$ , and measuring the angles  $A$  and  $B$ , the required side can be obtained, the calculation being facilitated by a table of natural sines.

The intersection of lines plays a very important part in surveying by the theodolite, or any angular instrument, as having two sides and one included angle, or two angles and one side, it is possible to find the distance between two inaccessible objects as two buildings, or to lay down a triangle from a given base line, and a remote object, illustrations of which will occur to any intelligent reader. Geometrically, one base line and two angles at its extremities enable the triangle to be completed by the intersection of the two sides drawn through the angles and their lengths taken, a problem which can be accomplished with exactness by a simple equation. As given, one side  $a$  and two angles  $B$  and  $C$ . Then side  $b = \frac{a \sin B}{\sin A}$ .

And side  $c = \frac{a \sin C}{\sin A}$ . The angle  $A$  being determined by deducting from  $180^\circ$  the given two angles. The labour involved in the multiplication and division of numerical quantities of several figures is very tedious, and the method of working by logarithms, or the representing of numbers by indices, is largely employed in the solution of triangles, as these two operations of arithmetic are performed by simple addition and subtraction. It is not within the scope of these articles to enter into the subject of logarithms, which the student will do well to study for himself.

#### ARCHITECTURAL ASSOCIATION EXCURSION, 1888.—III.

[WITH PHOTOGRAPHIC ILLUSTRATIONS.]

OUR descriptive notes concerning these proceedings terminated last week (p. 203) at Chesterfield, where, owing to pressure of time, the excursionists could not inspect the interior of All Saints' Church, already alluded to. It is a complete cruciform building chiefly of Decorated architecture, with Early English work in the transepts and Perpendicular windows in one or two positions. The Renaissance tombs to the Foljambes are exceptionally good, and the reredos of wood once really formed part of a parclose or screen round the Foljambé chantry. The programme on Wednesday opened with a long carriage journey to Tissington, passing Cromford at starting, and traversing the Via Gellia, with its well-wooded slopes and curling streams, which course their ways among the meadow-sweet beds on each side of the road below. A contrast to this delightful valley is found in the wild, bleak table lands which are known as the "Hill Top," between Egnaston and Ballidon. Making a descent towards the entrance of romantic Dovedale, and leaving the Peveril of the Peak hostelry to the left, Tissington was soon reached, and the church (St. Mary's) was quickly seen, for but little remains to interest the architect, as it was restored out of knowledge in 1854. The principal entrance has a good example of a Norman doorway, and the crudely-carved font is highly curious and barbaric in design. There

is a rich brass and an elaborate lofty monument, with some other memorials, to the Fitzherberts, who flourished in the 16th and 17th centuries here, and, if we may credit their inscriptions, history has thanklessly not done justice to their great qualities. The Hall at Tissington is the seat of Sir William Fitzherbert, but the excursionists were not allowed inside the gates, and so saw the building from the road. It is a small and not very remarkable sample of Elizabethan design, with a projecting window or two suggestive of Haddon Hall on a small scale, but with very ugly chimneys rising from the parapets, and an ordinary sort of doorway and porch. There are several springs in the village, and on Holy Thursday these wells are decorated with flowers, the villagers going in procession to church, singing psalms and chanting hymns, when a suitable service is held. In other parts this custom has degenerated into vulgar editions of the wakes. At Ashbourne bills were posted announcing the wake festivities, to be enlivened by mummies in character, and wake sermons in conjunction with these proceedings were advertised in the shop windows on the occasion of our visit. Mr. James Fowler, F.R.I.B.A., of Louth, described the church at Ashbourne, giving a brief epitome of its history, with particulars of its monuments, acknowledging his indebtedness to Mr. Maurice Adams for several details concerning them. We illustrated the church, showing its grand spire, known as the "Pride of the Peak," in our issue for August 10 last, when we printed some notes recounting the leading facts which mark its history and elucidate its characteristics architecturally considered. While we regret that much of the restoration here, executed under the supervision of Sir G. G. Scott, R.A., partook of too thorough a manner, it is but fair to add that a good deal of the destructive work was done by L. N. Cottingham many years ago. The Free Grammar School, built in Elizabeth's reign by Sir Thomas Cockayne, is situated near the church in the main street, facing a row of stone-built almshouses of the same date and of similar interest. Both buildings are simple specimens of their kind, and require but little description. The excursionists had lunch at the comfortable old hostelry celebrated as the "Green Man," and next proceeded to Bradbourne, where the church and beautifully-furnished Manor House were inspected under the direction of Mr. A. Hartshorne, who lives there. The Manor House itself is a simple building devoid of any special features save a very good staircase, but the elegant old cabinets, pictures, and works of art which it contains, coupled with the good taste displayed in the general arrangements and decorations, make the place most interesting. It is well situated to the east of Bradbourne Church, and has a good garden. The church is small, and has a low, square Norman tower of early date, with a rich door of that period inserted on the south side, with the usual Norman carvings and enrichments. Almost every style is represented in the building, from Norman down to the hideous marble, tile, and stone reredos of Victorian date, which disfigures the chancel. At the east end of the south aisle is a refined specimen of Adam's work in the form of a mural marble monumental slab, simply treated with elegant detail. Mr. Hartshorne exhibited a large coloured plan of the church, marking the various dates of its erection. The proceedings here terminated with an hospitable reception in the grounds of the manor. No time remained to see Brassington, and a two-hours' journey brought the party back to Matlock Bath for a late dinner.

Thursday was the most enjoyable day, in spite of the weather, which was cold and overclouded, like the rest of the week; but the adverse climatic circumstances were compensated very considerably by the interest of the places visited. An early morning drive through Rowsley (where, of course, everybody saw the "Peacock Tavern"), speedily brought the Associationists to Haddon Hall, when the President, Mr. H. D. Appleton, delivered a short address descriptive of the mansion and its builders. It stands, as the photograph printed herewith will show, on a well-wooded acclivity, overlooking the banks of the Wye, which picturesquely divides the meadows beneath its verdant pastures, where fat bees feed and give colour to the landscape. We printed some particulars of

the hall, with photographs of the interior, last week, and we also gave a detailed drawing of the ball-room. Besides the general view of the entrance tower, reproduced to-day from Messrs. Poulton's charming picture, we add an interior of the banqueting hall, and, according to promise, may now recapitulate the leading facts of its history. At the time of the Domesday Survey the Crown owned the manor, but William Peverel shortly afterwards possessed it, and on the death of William de Avenell, about the middle of the 12th century, it passed to the Vernons, and, as we mentioned last week, then went to the Manners family, the present owner being the Duke of Rutland. It has not been inhabited since 1703, and most of the rooms have been denuded of their furniture; but in many of them the ancient tapestry remains, while in one or two there is shown some curious bedsteads, a cradle, and other historic examples of wood work. The house is well cared for, and is in admirable repair structurally. Every facility is afforded to the public to view the place, and many thousands avail themselves during the season of the opportunity of seeing the buildings. The lower part of the walls on the south front and of the north-east tower are of the Norman period, and there are also some remains of that date in the chapel. The hall-porch, the kitchen, and adjacent offices were built in the 14th century, and so were the banqueting-hall, which divides the two quadrangles, the north-east tower, the cellage under the long gallery, and parts of the chapel. This building was finished in the 15th century, when the wing forming the east side of the upper quadrangle was erected. The western range of buildings in the lower court and the west end of the north side date from the earlier part of the 16th century. The long gallery, terraces, gardens, and various interior fittings and alterations belong to a hundred years later. It is not generally known, but, as Mr. Wm. M. Fawcett pointed out, there is a most remarkable parallel in plan and arrangement between Queen's College, Cambridge, and Haddon Hall, the only real difference being in the position of the gate-house. Several hours were spent by the party in examining the building, and many sketches were made, in spite of the wintery weather. Lunch was taken in the hall, where there remains some antique furniture; and before leaving, Mr. John L. Robinson, A.R.H.A., the hon. photographer to the A.A., took a group of the excursionists. Bakewell Church was next seen, and without doubt it is an exceedingly interesting cruciform building, although the north transept, with the central tower and spire, were rebuilt in 1841 at the time of the restoration of the fabric. The west end is Norman, and the rest is of various dates, chiefly Early Decorated. The Norman church had an apsidal end; but the present chancel is double the original length, and has a square end, with two windows, divided by a central pier and external buttress. The effect of this inside is very good, and the difficulty of successfully treating the high altar in relation to the dual fenestration has been admirably achieved by Mr. Geo. Gilbert Scott, M.A., who furnished the choir with stalls, erected a handsome screen, and decorated the chancel a few years ago. The reredos is a lofty and richly-designed structure in wood, running up between the windows, with florid pinnacle work, so contrived as to compose harmoniously with the lines of the openings beyond the altar, standing some few feet from the east wall. In the centre is a boxwood sculpture representing the Crucifixion. The pavement of the choir is in glass mosaic, of thoroughly good design, and the mural decorations, like those on the roof, are in reds and greens on a cream ground. The sculptures to the oak screen are in pear-wood; but the stalls are of oak entirely, some remains of the old ones being re-used where possible. The porch contains a very remarkable collection of Celtic and Irish-like crosses found in the neighbourhood, and some of these are extremely beautiful examples, and the south transept contains many monuments of considerable importance of the Vernons. No church seen during the week afforded more pleasure to the party than Youghreave, with which Thursday's programme finished. The church (All Saints) was essentially a good one, with a noble western tower; but Mr. Norman Shaw, R.A., has in-

vested the interior with the greatest interest without altering it in any leading particular structurally, and without asserting himself or his fancies. In fact, the only things in the building which seem out of place are the French chancel-light standards and the Birmingham brass altar-rail uprights, and for these Mr. Shaw is not responsible. The new fittings include the choir-stalls, altar, credence, and richly-treated pulpit, all of oak, like the seats in the nave. The floor of the church rises considerably towards the west end, and to avoid the effect of going down into the chancel, Mr. Shaw made the floor dip in the centre, and so a rise is secured towards the east, instead of a straight fall from the west end direct to the chancel. This is a small detail, but its effect is all that its author could wish. Instead of filling up all the available space with benches, a wide aisle is left, and an extensive space is arranged, too, round the font at the entrance, thus making the building look larger than it really is, with a result in other ways which cannot be over-estimated. The windows have their old quarry glass reinserted, after being repaired, and some quarries are of one shape, and some another, looking as if the lights belonged to the building. We need hardly say how much better this is than the usual regulation arrangement of what is called "cathedral glass," patterned out in all the shades of a glazier's trade list. The east window is a grand piece of work, from the designs of Mr. Burne Jones, A.R.A., representing Our Saviour and the Four Evangelists, in harmonious colourings by Messrs. Morris, and comprising some fine drawings of the figure. This window was the last specimen erected in an old building by this firm before they determined to put no more of their glass in ancient churches. Other splendid windows have been executed for Youlgreave Church by Mr. Kemp, and we think his glass is even more successful as glass than that by Messrs. Morris, which looks here too opaque—except, perhaps, the central figure, which is brilliant and jewel-like in character. The font is a remarkable example in hard grit stone, having a holy water stoup attached to the bowl, supported by a grotesque beast. The late Mr. Bloxham, when he was there, said this was one of the only three examples of the kind remaining in England. It formerly belonged to Elton Church. The parish registers of this church are very early, and are in fine preservation. The bells, too, are good. Anyone visiting this neighbourhood should not fail to see Youlgreave, and learn how a church ought to be restored, and remember it was done in 1869-70—long before the "Anti-Scrape" Society began to fuss and fiddle.

Friday's business began with a railway journey via Derby to Nottingham, where the travellers were met by drags to convey them to Wollaton Hall, some two miles out of the town, Lord Middleton's country seat. The entrance gateway was built from the plans of Robert Smithson, whose plans for this structure and certain minor alterations to the hall are preserved in the building, with some designs by Wyatt and by Messrs. Buckler, well known in their day as successful architects. Mr. Arthur Marshall, A.R.I.B.A., of Nottingham, met the excursionists, and Mr. J. A. Gotch gave a few particulars about the buildings. Wollaton Hall was designed by John Thorpe, whose plan for the house exists in Sir John Soane's Museum, and was built by Sir Francis Willoughby about 1580-88. Its erection occupied eight years, the Smithsons, father and son, being employed at first as clerks of the works to superintend its completion. There is undoubtedly an air of dignity and grandeur about the house, with its four great towers at the angles and the crowning feature of the building, which boldly rises in the centre of the composition, which is emphasised by the circular stone turrets at the four corners. Each front is similar to the other in general design, and our illustration of the garden side last week shows the most taking elevation. Inside the house is not very interesting, though it contains some fine pictures and works of art. John Thorpe's autograph sketch for the exterior façades was reproduced in fac-simile by Mr. Maurice B. Adams in the BUILDING NEWS for January 25th, 1878, when other similar examples of this architect's drawings were given. Over the entrance is the inscription "En has Francisc Willoughbæi ædis rara arte

extractas Willoughbæis relictas.—Inchoatæ 1580-88." John Thorpe probably died during the progress of the works, and a short epitaph in the neighbouring church records him as plain "John Thorpe, Surveyor and Builder." In the Wollaton church, however, is another monument, which illustrates the characteristic *esprit de corps* of the architect who finished Thorpe's work:—"Here lieth ye body of Mr. Robert Smithson, Gent., architector and surveyor unto the most worthy House of Wollaton, with diverse others of great account. He lived in the faith of Christ 79 years, and then departed this life ye XVth of October, AN'o D'NI., 1614." The great hall, with its hammer beam roof and flat ceiling, is the most interesting part of the interior. It measures 62ft. long by 30ft. wide, and it is 56ft. high. There were three grand staircases and a saloon, the latter being reached immediately from the garden entrance. On either side were placed the stairs, and these, with the saloon, occupied one side of the central hall. The three sides are employed to enrich the several stages of the angle towers, the Doric and the Ionic only being used for the main building. The ground floor is 15ft. high, and the first floor measures 17ft. The towers are crowned with perforated and shaped pediments, with a sort of flying buttress-like terminal, formed by four chimney-shafts, rising in the centre. An open balustrade extends round the intermediate façades. A large room exists over the hall and was intended for a ballroom, but is used as a store. The decorations on the staircases were painted by La Guerre, a pupil of Verrio, about 1680, and were restored by the elder Reingale. The subject of the ceiling represents Prometheus in the act of stealing fire from heaven, and the amazement of the gods of Olympus at his audacity. Portraits of the Willoughby family are introduced into some of these subjects. The staircases themselves are not the original ones. Ancaster stone was used for the building, and it is a great witness to the value of that material to feel how sharp the masonry has stood for three hundred years. The central part seems to have been added subsequently, and some have given Jeffery Wyatt credit for its erection; but on reference to John Thorpe's own drawing for the mansion this part is shown as executed with one or two minor modifications. The buttresses at the angles, for example, are alterations on the first design. An oil painting of the house seen in the hall, by F. Sibrechts, and dated 1695, exhibits the building as we now see it. John of Padua is generally mentioned as the architect of the house; but this claim will not pass examination, though no doubt Italians were employed on the sculpture introduced so freely into the elevations. During the past fortnight Lady Middleton has discovered the building accounts connected with the house, and Robert Smithson is named as clerk of the works; and he was employed at Longleat also. The masons were paid 10d. per day. Wollaton Church, just outside the park, is a very interesting building, having a western tower, with open arches on the N. and S. sides to the church, and thus forming a sort of western porch to the nave. The building contains some exceptionally good tombs, that on the north side of the chancel being the best of the series. Mr. Hodgson Fowler, of Durham, recently restored the fabric, and right well has he executed the work. The altar-piece is a late work in the Renaissance style, nicely coloured by Mr. Kemp, who decorated the east end and executed the glass in the windows. The new woodwork of the church is only fairly good. One feature in the recent fittings worthy of remark is the introduction of running curtains to the south windows to exclude the sun and furnish the church. This might often be done with great advantage in other churches; but usually the clergy object to this obvious improvement. Nottingham Castle was next visited, and the fine collection of pictures and works of art were examined, as well as the remains of the ancient fortress on the rock. St. Mary's Church greatly pleased the visitors for its vastness, lightness, and elegant design. Mr. Bodley, A.R.A., has lately added an altar-piece and other fittings in the chancel. St. Barnabas R.C. Cathedral, by the great Pugin, was inspected, and admired for its breadth of composition and boldness of design externally. The Albert

Hall, adjoining this church, is a strange contrast to Pugin's work, and may be described as vulgar in the extreme. The final dinner of the excursion was held on Friday night at the Bath Terrace Hotel, the comfortable quarters at Matlock of the excursion party. On Saturday some of the members visited Derby and went to the parish church, there to see Dorothy Vernon's tomb and the Cavendish monuments, for which the church is justly celebrated. Some of them are very poor pieces of work. The wrought-iron work to the sanctuary is very complete and good.

## PRACTICAL ARCHITECTURE WITH DETAILED ESTIMATES.—VII.

By HENRY LOVEGROVE, F.S.I., Surveyor.

JOINER AND IRONMONGER.

63. **FLOORS.**—The whole of the boarded floors throughout, except ground floor and attics, to be lin. wrought yellow batten, straight-joint flooring, with splayed headings, and mitred borders to hearths. The floors on ground floor to be similar; but 1½ in., and in box rooms ¾ in., sawn deal floors.
64. **Materials.**—The very best stuff to be used for these floors, and if any joints open more than one-sixteenth part of an inch within six months after the completion of the works, the whole must be taken up and relaid.
65. **Skirtings.**—The three reception rooms and the bedrooms on first floor to have 2 in. twice-moulded skirting, 1½ in. high. The box rooms to have ¾ in. skirting, 6 in. high. The basement to have lin. square skirting, 6 in. high, except the breakfast room, which, with the w.c., &c., on ground floor, is to have lin. moulded skirting, 9 in. high. The scullery, larders, &c., to have cement skirting as described.
66. **Windows.**—The windows of attics to have 6 by 3 oak wrought framed, sunk, weathered, and throated sill 4½ by 3, fir wrought framed, rebated, and beaded frame, 2 in. moulded sash, about two-thirds hung with 2½ in. butts, and fitted with Japanned iron casement lever fastening and stay. One inch window-board, with rounded edge and moulding under, ¾ in. wrought framed and splayed narrow grounds. The windows of bath-room and staircase, the three-light window first-floor, windows in entrance, circular windows, small windows near fireplace, window next garden entrance and to cooler to be similar to last. The windows generally to have deal-cased frames, with wide oak sunk, weathered, and throated sills, brass axle pulleys, patent flax lines and iron weights, 2 in. moulded sashes, double hung—the sash bars to be extra wide, in small squares, the top sashes to have moulded horns. The sashes to be fitted with brass spring sash fasteners, the lower sashes, when large, with brass sash lifts, and the upper sashes with pull-down handles. All to have window-boards or nosings, as required, 1 in. linings, ¾ grounds, and architraves to match the doors in each room.
67. **Doors.**—The attic doors to be 1½ deal four-panel moulded both sides, hung with 4 in. butts, and fitted with 6 in. iron rim locks, brass furniture and patent spindles, and china finger-plates on both sides, 1½ rebated jamb linings, ¾ narrow framed and splayed grounds, 3 in. moulded architrave with splayed plinth blocks 7 in. high to match skirting. The box-room doors to be 1½ two-panel moulded, and square, hung with 3 in. butts, and fitted with 6 in. iron rim locks, 1½ in. jamb linings, and 1½ in. by 1 in. chamfered fillet as architrave. The doors on first floor to be 2 in. deal, three-panel moulded both sides, hung with 4 in. butts and fitted with 6 in. mortise lock, and best china furniture with patent spindles, finger-plates on both sides to match furniture, 1½ double rebated jamb linings, ¾ in. framed, splayed, and beaded grounds, 4 in. moulded architraves, and 12 in.

splayed plinth blocks to stop skirting. The w.c. door to be similar, but to have the upper panel glazed (with matted sheet) in beads, and to have a brass w.c. latch and private bolt. The four doors to reception rooms to be 2in. deal six-panel, moulded both sides, hung with 4in. butts, and fitted with 6in. mortise locks, and white and gold furniture and finger-plates, 1½in. double rebated jamb linings, ¾in. framed, splayed, and beaded grounds, 4in. architrave mouldings and plinth blocks as before. The doors to w.c. and cloaks to be 2in. four-panel, moulded both sides, all as last, but fitted with brass w.c. latch and brass-necked bolt. The doors to breakfast-room and kitchen to be 2in. four-panel, moulded both sides, to larder and pantry moulded and square; the other basement doors, except those hereafter described, to be 1½in. four-panel square. All the other doors to be hung with 4in. butts in 1½in. double rebated jamb linings, with grounds as before, 3in. architrave and plinth blocks. The door from dining-room to conservatory to be 2in., the lower panel moulded both sides, the upper part sashed with extra stout bars in small squares hung with 4in. butts and fitted with 6in. mortise lock, two 9in. brass barrel bolts, and finger-plates as to dining-room door; the framing to match the door. The above door to be hung in 6in. by 4½in. rebated and beaded frame, and 6in. by 3½in. mullion and transom grounds and architraves to match other doors adjoining. The front entrance door to be 2½in. deal, the lower part in two panels moulded both sides, the centre part sashed in small squares and extra stout bars, the top part in semicircular panel moulded both sides and filled in with ornamental radiating bars hung with one and a-half pairs of 5in. butts; a Chubb's night latch, 20s., p.c.; letter-box handle and plate, p.c., 30s.; the frame to be 5in. by 5in., with 2in. by 2in. moulded fillet planted on, and the mouldings generally as shown on detail drawings. The doors to coals and tradesmen's entrance to be 1½in. deal, proper ledged hung with 15in. cross garnets and fitted with 8in. stock locks, the latter door to have, in addition, two 9in. barrel bolts; the frames 4½in. by 3in., with 3in. architrave. The door to back entrance to be 2in., the lower part in two panels moulded both sides, the upper part sashed as before; 4in. butts, 5in. drawback lock, and two 9in. barrel bolts; 2in. moulded fixed light, 4½in. by 3in. frame grounds, and 4in. architraves. The door near dustbin to be 2in. bead flush and square, the upper part sashed, hung with 4in. butts by 3in. frame, and fitted with stout drawback lock.

68. *W.C.*—The servants' w.c. to be fitted with 1in. clean deal seat and riser on strong fir bearers, the seat hung with 3in. butts, 1½in. framed and beaded frame, and mitred, clamped flap, hung with 3in. butts. The edges of flap and frame to be rounded, and the seat to have 4½in. x ½in. square skirting. The best w.c.'s to be fitted with lin. Honduras mahogany seat, and riser on fir dovetailed bearers, the seat hung with 2½in. brass butts, 1½in. mitred, clamped flap, and framed and beaded frame, hung with 2½in. butts, the flap to have a thumb moulding tongued on, and the seat to be skirting round with ¾in. x 4½in. beaded mahogany skirting.

69. *Bath-Top*.—The bath-top to be lin. Honduras mahogany, French polished, dished, and shaped, one edge rounded; the top on three sides to be skirting round with ¾in. x 4½in. beaded skirting, as before. Enclose the bath with ¾in. deal matched and V-jointed boarding, with small inspection door in same, hung with 2½in. brass butts, and a plinth, 6in. high and 1in. thick, planted on.

70. *Housemaid's Sink*.—The sink to have 1½in. deal top, on 3in. x 2in. bearers, the edge of top rounded, and skirting round with 4½in. deal square skirting. Under the

sink, 1½in. deal wrought, framed, and beaded inclosure to sink, with folding doors, hung with 2½in. butts, and fitted with brass knob turnbuckle, and 4in. iron neck-bolt.

71. *Scullery Sink*.—The sink in scullery to have top and bearers as last, also inclosure doors, &c., as last.

72. *Cupboard in Kitchen*.—Form a cupboard in kitchen 5ft. wide and 9ft. 6in. high, 1½in. deal beaded front, and two doors in same hung with 3in. butts, and fitted with brass screw cupboard knobs and roses; form tiers of shelves on 1½in. by 1in. wrought bearers plugged to wall.

73. *Dresser*.—The kitchen dresser to have 2in. top 2ft. wide on fir-framed, legs and rails 3in. by 3in., with 1in. pot-board with rounded nosing, 1in. riser, ¾in. skirting, 6in. high; three drawers, with ¾in. bottoms, ¾in. sides, and 1in. beaded fronts dovetailed together, and blocked oak runners; brass flush drop handles, and drawer locks. The upper part of dresser to have 1½in. wrought, cut, and shaped standards, three tiers of 1in. shelves, splay rebated for plates, 1in. wrought and beaded fascia, and 4in. moulding as cornice.

74. *Shelves*.—Provide and fix where directed 40ft. run of 1in. shelves 9in. wide; 43ft. of 12in. wide; and 22ft. of 21in. wide; all on proper bearers.

75. *Pipe Casings*.—Provide and fix where necessary deal proper pipe-casing, fixed with brass caps and screws, and deal wrought rebated and beaded grounds plugged to walls.

Carried to summary ...

## BY-LAWS OF THE BOURNEMOUTH COMMISSIONERS.

WE have received a copy of the by-laws relating to new streets and buildings made by the Improvement Commissioners, as the urban sanitary authority, for the district of Bournemouth, under the Bournemouth Improvement Act, 1856. The provisions agree with those of the Model By-laws as to exempted buildings and the width and construction of new streets. The diagrams explaining the exempted private buildings, not more than 30ft. in height nor more than 125,000c.ft. in extent, and also those exceeding that height and capacity, are useful. In the former case 30ft. clear is necessary on the two sides and rear, and 8ft. to the nearest street; in the latter the distances on the sides and rear from the boundary of adjoining land or premises is 60ft., and 30ft. is the distance prescribed from the nearest street. The other illustrations accompanying the text have been copied from Knight's "Annotated Model By-laws." Thus the sections of walls give the thicknesses fixed by the by-laws. With these rules and explanatory sections any builder can instruct himself as to the requirements. Recesses in walls, chimneys, and other structural matters are illustrated. The most useful part of the pamphlet is that relating to the drainage of buildings. Plans of subsoil drains, sections of disconnecting traps with air inlets, main drain disconnection, and other details are given. We congratulate the urban local authority and their surveyor, Mr. G. R. Andrews, on the prospect of placing all building operations under the by-laws. The future of Bournemouth as a resort for invalids will be very fully bound up with the sanitary regulations in force within the district, and the authorities could not have accomplished a wiser measure of legislation.

## BOOKS RECEIVED.

*Movable Wooden Churches*, by W. JEFFREY HOPKINS, F.R.I.B.A. (Worcester: E. G. Humphreys.) Mr. Hopkins, of Worcester, has just published a second edition of his pamphlet, setting forth the advantages to be derived by the adoption of movable wooden churches for temporary purposes over the ordinary iron ones. He states that both for cheapness and comfort wooden structures are preferable, and as to the former condition, he states that a building seating 200 adults, and containing 1,440 superficial feet, would cost, complete in wood, with double-boarded walls, filled with sawdust, block-flooring, and wooden asphalted and slated roof, and chairs, £324, or 4s. 6d. per foot super, whereas the commonest iron structure would cost 6s. 11 1/2d. per foot super, exclusive of brick or masonry foundations. Wooden buildings would also, Mr. Hopkins says, compare favourably in appearance, and possess greater facility of erection and removal. *Walks in the Ardennes*, by PERCY LINDLEY. A new edition of this well-written guide to the picturesque scenery and towns on the banks of the Meuse and Moselle has been published for the autumn holidays, under the auspices of the Great Eastern Railway. It is illustrated by numerous sketches, and will afford many useful hints to the intending tourist, who will find Luxembourg and South-Western Belgium provide fields for inexpensive and interesting

trips.—*The Glasgow Architectural Association Sketch-Book*, Vol. III. for 1888, has just been published, and comprises several excellent sketches and drawings. Mr. W. Fergusson's sketches of old houses and Newark Castle, and those by Mr. G. Washington Browne of Bablake Hospital, Coventry, and Manor House at Ockwells, are very feelingly drawn in pencil. St. Mary Magdalene College gateway and old houses, Chartres, by Mr. H. D. Walton, are also of interest. Half-timber work appears to have had a charm for our younger architects north of the Tweed. Some picturesque houses at Tunbridge and Chiddingstone, Kent, are contributed by Mr. G. W. Browne. Mr. Andrew W. Prentice sketches pulpit in the refectory Chester Cathedral, and Nantwich Church—both interesting subjects. We must also mention the sketches and drawings of Lincoln Cathedral, including its north-west transept, galilee porch, and south-west pinnacle, the measured drawings of cloisters, and the organ screen and door to choir by Alex. M'Gibbon. Henry D. Walton's gateway of St. John's College, Cambridge, John Begg's of Howden Church, and Rievaulx Abbey, are vigorous and clever. Drawings and sketches of Dunblane Cathedral and Dryburgh Abbey, Fortrose Cathedral, by John James Joass; Furness Abbey, by William James Anderson; Kelso Abbey, by Alexander M'Gibbon, are among the plates of the present interesting volume.

## BAKERS' OVENS AT DOVER.

THE brick crowns of the ovens are turned upon a sand core beaten hard and formed as required. This is removed when the crowns are thoroughly set. In the case of the ovens illustrated the crowns were formed of hard paving bricks from Cheriton, placed on end, breaking joint, and grouted with lime and coarse gravel. The levelling up over crowns may be brickwork or lime concrete. The sides of the ovens are also formed of Cheriton bricks on end edgewise—i.e., 4 1/2in. thick. The paving tiles forming oven floors are laid in sand to allow for expansion; if laid in the usual way, they would "buckle" when the ovens were heated. Care should be taken that no pebbles or other hard substances find their way into the joints of the floor tiles. 1in. iron tie rods should be fixed immediately above the crowns with long arms to hold in the sides of the ovens, two or three from left to right, and two in each oven from front to back. Stout hoop iron should also be used without stint in the walls. The oven door, boiler, furnace, fire bars, ashpit door, damper, and fire lumps for sides and top of furnace are trade articles, but a larger boiler than that usually supplied with these sets is desirable—say, one to hold 20 gallons for each oven. The use of cement in any part affected by the heat is considered objectionable. As regards the asbestos for the sides and top, Bell's first quality is, it is almost superfluous to say, greatly superior to the second quality, and architects should not only specify the former, but "see that they get it."

The Tunstall local board of health rescinded, last week, a resolution passed in September, 1885, appointing the present surveyor (Mr. A. R. Wood) to that office, at a salary of £100 a year, and a percentage on extra work; and agreed to pay him a salary of £150 a year, such salary to include remuneration for all the duties of surveyor as defined by the Public Health Act 1875, but to be exclusive of any architectural work, which the Board will deal with as it arises. It appeared that during the time the surveyor had been in office under the Board his salary and commission had averaged £158 per annum, so that by passing these resolutions the Board would be saving £8 a year.

Chenonceaux, the mansion in the Touraine built by Francis I. for the Duchesse d'Etampes, and afterwards occupied by Catherine de Medici, Queen of Henri II., and chief instigator of the St. Bartholomew massacre, is announced for sale at Tours on the 15th of September. The chateau, which is probably the most picturesque of its class in France, was illustrated from a sketch by Mr. Ernest George in the BUILDING NEWS for December 25, 1874, and from Mr. Edwin Seward's drawing in our issue for August 13, 1880.

The work of restoring the Church of St. Peter, at Little Driffield, from plans by Mr. Temple L. Moore, of London, is about to be commenced by Messrs. G. Shepherdson and Son, of Driffield. The cost will reach about £1,000.

## OUR LITHOGRAPHIC ILLUSTRATIONS.

ARCHITECTURAL ASSOCIATION EXCURSION  
SKETCHES.

For description, see p. 231.

R.C. CHURCH OF ST. JOHN THE BAPTIST,  
BRIGHTON.

THE view of the interior of St. John's Church, reproduced from the drawing in the Royal Academy Exhibition of this year, shows the entrance end of the building as designed to be changed in appearance by the removal of the old flat, plastered ceiling, the decoration of the timbers of the existing sound and strong queen-post roof, and the construction of an ante-chapel under the gallery for the use of those who may wish to make visits of devotion at times when the rest of the church may be closed. As shown in the view, confessionals are to be erected and the gallery rearranged with the central portion as a chapel of the Holy Rood, having space on one side for the organ, and on the other a tribune for the nuns of the adjoining convent. The church was erected somewhat more than fifty years ago with the small effort at architectural effect characteristic of the period; but to the credit of the builder, who was also the architect, it is a solid construction. The sculptured altarpiece in white marble is a fine work by Carew, as is also the memorial to Mr. Fitzherbert. There are other sculptured memorials and works of interest, all of which will be carefully preserved. A view of the proposed work to the exterior of the church, with a plan, was given in the BUILDING NEWS of June 24th, 1887. The architect for the whole of the work is Mr. S. J. Nicholl, of 1, Caversham-road, London, N.W.

## PROPOSED CHILDREN'S HOSPITAL, HULL.

THE erection of this building was intended to be in celebration of Her Majesty's Jubilee, and will supply a long-felt want in Hull, as the accommodation in the existing hospital in Storey-street is totally inadequate to the growing necessities of the town. It has been designed to accommodate sixty inmates, fifty being provided for in wards on the first and second floors, and on the latter floor is also planned a small ward for four cots in close proximity to the operating-room. In addition to these, a ward for six cots is obtained on the second floor, totally cut off from the rest of the building, being reached by an independent closed staircase, which is entered from a covered way outside the building, and is intended for the isolation of children who may develop infectious disorders during their stay in the hospital. The accompanying plans will explain the provision made for the several departments, and in them it has been sought to combine the advantages of the pavilion system with due regard to economical construction. The limited area of the site has somewhat hampered the design, its very central

situation having recommended it to the committee charged with the erection of the building. The hospital being intended for children has been a guiding principle in the preparation of the design, the capacity of the wards, &c., being regulated with due regard to that important consideration. The nurses' rooms are placed in mezzanine floors opening from the first floor staircase landing, but entirely cut off from the building. The domestic servants are placed in the rear of the wards, their rooms being reached by a separate staircase. Attached to the hospital, but fronting another street, is the out-patients' department, in which a most important part of the hospital's operations are carried on, and the absence of which has greatly crippled the work done in the present building. It is intended that the building shall be erected in red pressed Lincolnshire bricks, stone being used when necessary, and that as to sanitary arrangements, ventilation, &c., it will be supplied with the most approved appliances which the construction of hospitals has hitherto developed. The design was selected in public competition, and is by Mr. Samuel Musgrave, F.R.I.B.A., 18, Trinity House-lane, Hull.

"BUILDING NEWS" DESIGNING CLUB.—A  
GARDENER'S COTTAGE.

THIS sheet is the last drawing to be published in our series of BUILDING NEWS Designing Club illustrations for 1887-8. It illustrates "Boreas's" design for a Gardener's Cottage, which was placed second in the late competition. The first design, together with a notice of the whole number of plans sent in for this subject, will be found printed in our issue for July 20th last.

## COMPETITIONS.

"OWEN JONES" PRIZES.—This competition was instituted in 1878 by the Council of the Society of Arts, as trustees of the sum of £400 presented to them by the Owen Jones Memorial Committee upon trust to expend the interest thereon in prizes to "Students of the School of Art, who, in annual competition, produce the best design for household furniture, carpets, wall-papers and hangings, damask, chintzes, &c., regulated by the principles laid down by Owen Jones." The prizes are awarded on the results of the annual competition of the Science and Art Department. Six prizes were offered for competition in the present year, each prize consisting of a bound copy of Owen Jones's "Principles of Design" and a bronze medal. The successful candidates are:—James J. F. King, Glasgow, design for Persian carpet; Herbert Cole, Manchester, design for carpets; Andrew Richmond, Glasgow, design for printed hangings; Emily Batters, Hertford, design for tiles; Samuel H. Moss, Macclesfield, design for tiles; and George Pettitt, Manchester, design for printed hangings.

ARCHITECTURAL & ARCHÆOLOGICAL  
SOCIETIES.

ARCHÆOLOGICAL CONGRESS AT GLASGOW.—The programme of the Congress of the British Archæological Association, which opened on Monday at Glasgow, includes visits to Stirling Castle and Bannockburn, the Royal Palace at Linlithgow and the Roman wall near Falkirk, Dumferline Palace and Abbey and the tomb of Robert Bruce, Lanark and the falls of the Clyde, the Castle of Doune and Dunblane Cathedral, Paisley Abbey, Rothesay Castle and other old buildings and remains in the Isle of Bute, Bothwell and Craignethan Castles, the field of the Battle of Langside, &c. The members will also inspect the cathedral of Glasgow and the pre-historic hill fort near Langside, and possibly also Dumbarton Castle and Newark and the termination of the Antonine wall. The Congress will be entertained by Lord Bute, who has accepted the office of president, at his new palace, Mount Stuart, in the Isle of Bute, and at a *conversazione* to be given by the Lord Provost and magistrates of Glasgow.

The Eiffel tower in the Paris Exhibition grounds is making good progress, a total altitude of 390ft. out of the projected 934ft. having been attained by the finished ironwork. The cost is expected to come well within M. Eiffel's original estimate of £160,000.

NATIONAL REGISTRATION OF  
PLUMBERS.

ON Saturday afternoon the diplomas granted under the movement for the national registration of plumbers for the district of Aberdeen, Banff, and Kincardine Shires were distributed in one of the classrooms of Robert Gordon's College, Aberdeen. Sheriff Brown distributed the diplomas. Before doing so, however, Mr. Brown expressed the lively satisfaction he felt in the opportunity afforded him of showing his sympathy with a movement that he believed to be sound to the very core. He understood that the national system which was sought to be promoted for Scotland had been affiliated on the Worshipful Company of Plumbers in London, and that already there had been formed six district councils in Scotland, that for this part of the country including Aberdeenshire, Kincardineshire, and Banffshire. He was informed by the secretary that 3,000 persons had already been enrolled in the Association, and that 79 of them belonged to this district. This was not merely a trade interest, but a movement in the highest sense consecrated to the public service, for which their interest and sympathy were invited. Dr. Matthew Hay, in the course of an address, dealt with the origin of the movement. He expressed the hope that the Scottish Society, which had not, so far as he knew, met with such general support throughout Scotland as to justify a separate existence, would allow its system of registration to become merged into that of the Plumbers' Company, which had now root in every town in the kingdom.

## CHIPS.

Mr. J. C. Pardoe, assistant surveyor to the Merthyr Tydfil local board, has been elected surveyor and inspector to the local board of Barry and Cadroxton.

A Jubilee clock has been erected in the tower of Crowland Abbey, and was unveiled on the 9th inst. The dial is 10ft. in diameter, and the clock is provided with chiming apparatus. Mr. James Dawe, of Wisbech, is the maker.

The Archæological Section of the Birmingham and Midland Institute visited Chester on Thursday, Friday, and Saturday last. The cathedral was visited under the conduct of Archdeacon Barber; Mr. Shrubsole, of Chester, acted as guide on the Walls and in the Museum, and Mr. Ewen took the visitors about, behind and beneath the Rows. On the closing day a visit was paid to Hawarden Castle.

The Glasgow District Board of Lunacy resolved on Friday, anent the claims by Messrs. Bruce and Hay, architects, and Mr. John Dansken, measurer, for work done in connection with the abandoned asylum project at Hartwood, to settle them for £2,375 and £1,199 15s. respectively, as against £3,000 and £2,000 originally charged.

Works of drainage have just been carried out in the village of Shoreham, near Sevenoaks, Kent. Mr. Hennell was the engineer, and Mr. Lansbury, of Bromley, Kent, the contractor.

New waterworks are being constructed for the Northwich Local Board at Cotebrook, and were formally inspected by the members of the board last week. Mr. Bancroft is the engineer; Messrs. Hughes and Son, of Dudley, are the general contractors; and the cottage, committee-room, and other buildings at Cotebrook are being erected by Mr. Fleet, of Tarporley.

Col. Walter Mardon Ducat, R.E., Local Government Board Inspector, held an inquiry at the Town Hall, Gateshead, on the 8th inst., respecting the proposal of the Corporation to borrow £1,556 for improvements at Saltwell Park and Windmill Hills.

Saint Michael's Church, Stockland, Chard, was formally reopened for Divine worship on Tuesday week, after undergoing thorough restoration. New seats and floors have been placed throughout, pitch-pine open benches replacing the box-like pews. The chancel floor is laid with specially designed encaustic tiles, manufactured by Godwin and Son, of Lugwardine, near Hereford.

A stained-glass window, representing the Apocalyptic vision of the New Song, has been placed in All Saints' Church, Blackburn, as a memorial. It was executed by Mr. Swaine Bourne, of Birmingham.

The new schools, St. Clare's Convent, Pantasaph, for which Mr. E. Kirby, of Liverpool, is the architect, are warmed and ventilated by means of the patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester and London.

## WAYSIDE NOTES.

I AM glad to see the enthusiasm with which the representative Committee of the Wood-carvers of London are endeavouring to raise the standard of the present English school of wood-carving; and I trust that the Council of the Institute will extend its sympathies to the craft, in response to the humble petition which was recently sent to Conduit-street. One feels greater interest in the new undertaking of the Wood-Carvers' Committee, because it is just what we were advocating lately, as the only thing calculated to counteract scamping workmanship of the "cheap and nasty" order, which has been so far fostered under Mr. Buggins's gentle care. Cannot a few more craftsmen emulate the example of the wood-carvers? The stone-masons should go hand in hand with the wood-carvers; and as masonry is the soul of architecture, great things might reasonably be expected to result from such an action. The trades, however, that should really co-operate more and sympathise more with the wood-carvers are the joiners and furniture-makers. Something is badly required to checkmate "sweating" in these trades; and, besides this, more sympathy between them and the wood-carvers would lead to the production of more really artistic joinery and furniture. The marked improvement in the design of furniture, in late years, does not, I fear, go hand in hand with any advance in solidity of construction. Let the trades concerned, then, invite the wood-carvers, and look about for some means of improving their position and doing away with sweating and sweaters.

It is curious to reflect that the most creditable workmanship in the building trades is performed in restoration jobs. I suppose that all concerned are ashamed to work badly when they find the old work so thoroughly done. Or perhaps it is that there is no speculation about it, and that nothing is undertaken that cannot be paid for at a fair price. Money for restoration work seems too "easy." The energetic measures taken to procure funds for the restoration of Peterborough have resulted in new subscriptions to the amount of about £4,365—not a very great sum for such a building it is true, and not likely to last long in an English restoration. In a French church a matter of from £4,000 to £5,000 would keep them busy for years, but then the method of procedure differs so in the two countries. Here we make a clean sweep (very much so at times) in a few months of the whole affair, whilst in a French cathedral or church they appear to go on the principle of keeping two or three men permanently pottering about the building. Theoretically, the foreign method would be the better of the two, as being more consistent with the "stitch in time saves nine" policy which should equally apply to the repairs of churches as to the mending of coats.

Touching restorations, I observe that your correspondent, Mr. Carpenter, has taken exception to my leading notes of the 10th inst. It puzzled me for a long time to reconcile my criticism with the thing criticised, and with your correspondent's letter. I now find, on looking through the *Institute Journal* of the 31st July, that Mr. Carpenter has been pleased to imagine that I was criticising his article on "The Restoration of Ancient Buildings," whereas, on referring more carefully to my notes, he will find that I alluded to the "numerical paragraphs" on "General Advice to Promoters of the Restoration of Ancient Buildings," contained in the same number. At the time of writing I was positively unaware that your correspondent had contributed anything to the *Journal* in question. The mystery being thus explained, it is unnecessary for me to say more about the subject, other than to beg to state that I still hold fast by my opinions expressed on the 10th of this month. I trust, however, that Mr. Carpenter will, in future, be more cautious, and ascertain that criticism really alludes to his work before taking exception to the opinions expressed.

Liverpool-street Station is to be enlarged at a cost of a million sterling. Great preparations are being made for the new work. Property on the west side of Bishopgate-street is now being demolished. In connection with the improve-

ments at the terminus, two additional lines of rails will be put down as far as Bethnal-green Junction, which, so far as I can understand, will be a curious piece of engineering. It is stated that the new lines will run underground. The Great Eastern Railway is a go-ahead line, and slowly and surely improving, both as regards its system and railway-station architecture, which at one time was anything but grand in some places.

Ship canals are becoming a mania. Even before the success of the Manchester undertaking is assured there are rumours of the probable construction of a canal between the Bristol and English channels, and one also between Sheffield and the sea. The proposed route of the former is from the North Somerset coast to Seaton, on the South Devon coast, via Taunton. Rough estimations put the probable outlay at £70,000 per mile. Costly undertakings are these inland waterways for ocean-going vessels. The distance from the Bristol Channel to Seaton is about forty-five miles, and anyone able to tackle the intricate mathematical problem involved may arrive at the total cost, and ask, with the young competing architect, whether the game is likely to be worth the candle, as, in addition to this, will be the cost of constructing harbours of refuge; the whole being for the benefit of Bristol, by enabling mariners from the East-Coast ports and the North of Europe to avoid the necessity of doubling Land's End. The Sheffield Chamber of Commerce has under consideration the proposition to construct a ship-canal to their town, which canal, it is proposed, shall conduct to the boisterous North Sea at or near the Port of Goole.

The Local Board of Health for the district of Newton Heath know how to kill two—if not several—birds with one stone. A free library is one thing, baths are another thing, and an assembly-room is something else. Yet in the recently-announced competition all these and other features are to be included in one building. As the inhabitants of Newton Heath want so much for their money, they might at least have let us off the half-a-crown entrance fee which I see must be paid for instructions and particulars.

Of the various more or less sensational topics broached to fill the columns of the dailies in the silly season, the most interesting, from our point of view, is the question of the daily opening of churches. This discussion, carried on in the *Times* and *Standard*, and, for all I know, in other papers, was started by the Archbishop of Canterbury and Lord Carnarvon. Every architect will throw in his voice in the direction of opening churches. Putting aside theological questions as out of place here, how many an old interesting building have we all missed seeing, because of the selfish closing of doors that obtains in the Established Church of England! To make matters worse, it is not always that the worthy sexton lives hard by the old village church, and a search for his abode often consumes much precious time. Even when found, it is only in exceptional cases that one is allowed to take the keys and inspect the building quietly, but we must await the leisurely old gentleman, and, perchance, listen to his long yarn about hideous monuments, when we would peacefully study the old architecture. I have long ago learned to give up the attempt to see the interiors of many English village churches in the ordinary week-day, though on a Saturday one may have better luck. Fortunately for the half-holiday tramps of the student, Sunday-eve is the best time for a ramble amongst country churches, as then, more often than not, cleaning and tidying operations are conducted in preparation for the services on the morrow.

There is a selfishness about this closing of the doors of Anglican churches that is very repugnant to those who have been accustomed to the open and inviting portals of Continental cathedrals and churches. Instead of arriving at the building and shaking a rusty door-handle and rattling the bolts in their sockets, as we are so used to do in this country, we find wide, liberal doors thrown open, enabling us to obtain one of those enchanting glimpses of the interior, which

forms our first introduction to so many new buildings on the Continent—scenes which not a few holiday-making architects and students are at the present time enjoying—glimpses of misty arcades receding towards the far end of the apse, where the sombre air is relieved by the scintillations of stained-glass windows. Many will call to mind pictures of enchanting beauty formed by this peep into a cool Continental interior, framed by the sun-lit, richly sculptured, and much moulded orders of the great west portal—pictures we seldom or never see in this country, because our church doors are shut against the multitude, and because, as Mr. Ruskin has said, the typical English west portal is as insignificant as the entrance to a beehive.

I have inspected the large picture of "The Ascension" which Mr. W. Cave Thomas has been engaged upon for some time past, intended to be placed over the altar at Christ Church, Marylebone. The artist has ably embodied the scene as described in St. Luke's narrative. There is a lower group composed of seated figures of St. Peter and St. John, and the other nine of the disciples round a mound of rock, the distant blue hills bounding the horizon. SS. Peter and John occupy prominent positions in the foreground; they are represented in an attitude of wonder and prayerfulness, and the colouring of the draperies are strong and luminous. In the background the other disciples are shown with hands clasped, some of them as if aroused from sleep. The Saviour is, of course, the central figure in the upper group. He is in the act of benediction, his hands lifted up and his face raised heavenward. On each side of Our Saviour is a group of adoring angels, an effulgent and radiant light enveloping His person. Of course, we have the conventional cloud which separates the disciples and the darker hills of the earthly scene. The figures are luminously painted, Mr. Cave Thomas adopting the plan of making his lights strong, the shadows being, as it were, suffused and toned by them, and this treatment is necessary for the position the picture is to occupy. The composition of the figures is well balanced and the whole picture dignified, displaying a refined and idealised conception of the subject. GOTHE.

## CHIPS.

Mr. W. Howard Seth-Smith, President of the Society of Architects, has been appointed architect of the new Marling Grammar School at Stroud, Gloucestershire. The governors have secured a fine site, eight acres in extent, near the town.

The death is announced, at the age of 69 years, of Mr. William H. Baily, acting palaeontologist of the Geological Survey of Ireland. In 1844 he was attached by the late Sir Henry de la Beche to the Geological Survey of England, first as a draughtsman, and afterwards as assistant naturalist. In 1857 Mr. Baily was transferred to the Irish branch of the Geological Survey as palaeontologist, and this post he held until his death. He was also demonstrator in palaeontology to the Royal College of Science, Dublin.

Preparations are being made to demolish a considerable amount of building property on the west side of Bishopsgate-street, to form the site of the enlargement of the Great Eastern Railway Company's Station at Liverpool-street, the cost of which is estimated at a million sterling. Meanwhile the company are about to widen their line between Liverpool-street and Bethnal-green Junction, to the extent of two additional lines of rails, this undertaking involving the construction of an underground line from Wheeler-street to Brick-lane, northwards of the existing line.

The following gentlemen have been selected from 150 candidates for the office of Borough Surveyor of Sheffield, for which the salary offered is £800 a year:—Mr. Joshua Cartwright, borough engineer of Bury; Mr. Thomas Longdin, borough surveyor of Warrington; Mr. R. S. Dagdale, borough surveyor of Huddersfield; Mr. J. T. Eays, borough engineer of West Bromwich; Mr. J. W. Brown, borough surveyor of West Hartlepool; and Mr. Charles F. Wike, assistant borough surveyor of Leicester. The highway committee will have an interview with the six surveyors named on Tuesday next.

The Wolverhampton board of guardians have finally adopted plans by Mr. C. H. Stanger for the proposed eight cottage homes. The commission offered and accepted by Mr. Stanger is 5 per cent. on the first building, and 2½ per cent. on the remaining seven homes.

## BACK-TO-BACK HOUSES.

THE joint report by Dr. Barry and Mr. P. Gordon Smith on back-to-back houses, just issued by the Local Government Board, will be read with interest by all who have the sanitary welfare of our large manufacturing town population at heart. The report gives, in a concise and classified form, the information obtained as regards these dwellings in several towns, the number and proportion of "back-to-back" houses built recently in Halifax, Morley, Todmorden, Stainland, Keighley, Leeds, Bradford, and other towns in Yorkshire. It is not a very gratifying fact to be told that in many of these towns a very large percentage of the houses built during recent years are on this principle—certainly anything but reassuring of the progress made in sanitary building. Dr. Barry and Mr. P. Gordon Smith have sought for particulars under five different heads, as follows: (A) Extent to which back-to-back dwellings have been built during recent years; (B) Space about dwellings required by local regulations, and the amount actually provided in practice, together with the arrangements made for securing circulation of air about dwellings; (C) relative density of houses on area; (D) structural arrangements of buildings as to stability, prevention of fire, means of ventilation, disposal of excrement and refuse, and accommodation afforded in different classes of houses; (E) relative cost of houses, &c.; (F) influence of different classes of houses upon the health of inmates.

First, as to the proportion of back-to-back houses, the table given is convincing. To take Halifax, out of a total of 2,094 houses built from 1876—86 (11 years) no less than 1,287, or 61 per cent., were found to be on this plan, and with the exception of one year, the proportion of "back-to-back" houses was greater than that of "through" houses. In some years the percentages were very high, in 1879 as high as 83 per cent. of the total number built. In Morley the proportion is 82 per cent., and is steadily increasing; at Bradford, out of a total of 7,036 new houses certified as fit for habitation, 64 per cent. were built on the back-to-back plan, or during the 11 years (1876—86) new dwellings have been erected for over 20,000 persons unfurnished with means for thorough ventilation. At Leeds, in two years 1885—1887, out of 2,311 houses for all cases certified as fit for habitation, no less than 1,502, or 65 per cent., were on this plan. During the 12 years ended August 1887, 16,070 new houses of all classes have been certified as fit for habitation, and of these it is estimated that at least two-thirds, or 10,780 houses, have been built back to back, a number which, taking 4.7 persons to each house, would accommodate over 50,000 persons. Though at Dewsbury the by-laws allow the open space to be provided at the side of houses, permitting the erection of blocks of four back-to-back houses, no such houses have been built of late, and the council refused to pass plans which did not provide space in the rear. At Saville Town, Keighley, and other places back-to-back houses are limited.

As regards space about dwellings, the report deals with the local regulations in each district, and the manner they are carried out. The regulations as to open space at Halifax are that the width of a first-class street shall be 54ft. inclusive of footpaths; a second-class street shall be 40ft.; a third-class street 30ft., all to be carriage roads. Every new street not a carriage road is to be 20ft. wide at least, and there shall be one entrance at least the full width thereof. Another section of the Local Act regulates the height of buildings erected in existing streets, the height being limited to two stories, exclusive of cellars, in any street made or laid out after the passing of the Act of less width than 10 yards, and to three stories in any such street of less width than 12 yards. The report states that in actual practice the minimum width is allowed in streets inhabited by artisans. For securing light and air the following sections are in force:—(1) "It shall not be lawful for any person, without the previous consent of the corporation, to erect dwelling-houses in blocks so that any block shall contain more than eight dwelling-houses when built back to back, and four dwelling-houses not being through houses

when built in a single row." The second by-law states that an open space shall be left at the end of each block, and to remain free from any erection thereon above the ground except privies. The distance across such open space between every such block and the opposite property at the end or side shall not be less than 15ft. at all points, or every house shall have at the front or back an open space to the extent of 150 square feet. From these regulations, Dr. Barry and Mr. Gordon Smith observe: "It would appear that in a street where back-to-back houses were erected in blocks of eight on both sides of the street, and where the distance between the adjacent blocks was less than 15ft., it was intended that there should be a clear space of 60ft. between the opposite houses. (This regulation has never been put into force, the provision of 150sq.ft. of space in front, irrespective of the width across the space being accepted.) When, however, the houses are erected in rows consisting of more than eight houses, it would appear that the provision of only 150sq.ft. of open space to the front of each house is considered sufficient." The authors justly observe that the sanitary authority of Halifax have used very freely their discretionary powers. In one block, surrounded on three sides by streets 30ft. wide, there are 16 back-to-back houses, detailed plans of which we give in our plate, each house 17ft. deep, exclusive of garden and privies, and 20ft. 7½in. wide; in another portions of two blocks of 28 and 30; in a third a portion of one block of 40 back-to-back dwellings; and in a fourth, a portion of a block of 20 "single" houses without any openings for circulation of air. The amount of air space per house, exclusive of streets, are 172, 462, 4,712, and 168-sq.ft. respectively. These irregularities are instructive, and shows how unequally the provisions of the section are carried out. Our plans Z¹ exhibit the back-to-back type of house prepared in accordance with the minimum requirements of the by-laws and regulations of the Halifax Urban Authority; and Z², "through" houses of approximately the same size. As regulations limiting to eight back-to-back or four single houses are no longer in force in the town, the danger of stagnation of air in localities with long rows of such houses without cross streets is likely to occur.

At Morley the code of by-laws gives a minimum width of street of 36ft., and for streets not intended for carriage traffic of 24ft., when they are not more than 100ft. in length. The erection of back-to-back houses is limited to blocks of eight, the distance across the space in front of houses to be 36ft. at the least; the width of street may be included in this space, and a space of 12ft. is to be provided between the blocks, or of 6ft. between the blocks and other buildings of 6ft. in width at the least. The "through" houses built at Morley have a common yard at the back in spite of the by-law, which provides that the open space is to belong exclusively to each house. Another block plan given exhibits an estate of six blocks of back-to-back houses, with intervening spaces of 12ft., and 54ft. between opposite blocks. A third plan shows the extent of overcrowding of these houses when the space occupied by each house, including a due proportion of street, is only 78 square yards. At Todmorden the state of things is even worse, as there are no provisions with respect to width of new streets, nor as to open spaces about houses. In one case shown on plan, a block of ten back-to-back houses faces a street only 30ft. wide on one side, and the main sewer passes directly underneath them. The through houses are worse; a passage of 13ft. is in the rear of two parallel rows, one end stopped by a block of privies and ashpits common to all the houses. Stainland is equally bad: the "through" houses shown are without back streets in some cases, and the open space in rear is much below the area required by the Model By-laws, some of the back-to-back dwellings being huddled together between streets only 15ft. wide. It is pleasant to turn to Keighley. Here the regulations contained under the Waterworks and Improvement Act, 1872, provide for streets of 36ft. and 24ft. minimum width for the two classes of traffic; but the local authority, in exercising their discretionary powers, have increased rather than diminished the widths, and have made a recommendation to provide an open space of

200ft. at the least in front of dwelling-houses which do not face any street. The report states that these regulations only permit of the erection of four back-to-back houses in one block, and that the blocks must be separated by a space of at least 10ft.

We illustrate a block of back-to-back houses built in accordance with these rules. The authors of the report say "there can be no question that, putting on one side the subject of density on area, this method provides incomparably the best means for securing the thorough circulation of air about such houses." One of the omissions in the by-laws is pointed out—namely, that the provision of windows on each floor overlooking the open space at the ends of blocks is not made obligatory, thus sacrificing the advantage of the four-house arrangement. The relative areas occupied by buildings, by streets, and by yards and forecourts are given in a table of special value, to which we direct attention. In Halifax, where there are sixteen houses to the block, and the open spaces are in accordance with the minimum regulations, the density of houses varies from 46.5 up to 61.4 per acre, giving a density of population varying from 214 to 282 persons per acre. In those dwellings where the amount of open space exceeds the local requirements, the number of houses per acre is only 36.6 and 37.5, or a population of 168 and 172 persons per acre.

At Morley the density of houses per acre is 42, 57, and 62, giving a population respectively of 193, 262, and 285 per acre. Todmorden, where no regulations are in force, the density of the through houses is 55.2 and 69.1, and the population 253 and 317 persons per acre respectively. The back-to-back houses in one case show a density of 75.7 houses and 348 persons per acre. Keighley shows a density in the back-to-back houses of 58.9, or a population of 271 per acre. It may be of interest to note that while the density of the central districts of London is 107,729, some of these back-to-back houses show a rate of 182,400, and even 222,720 persons to a square mile; but the greater height of London houses must be also borne in mind. In another table the report gives the areas of land provided for open spaces as regards through houses. In the case of streets more space has been provided than is required by the model clauses; but as regards yard space, the amount provided is generally far below that required under the model clauses. An instructive diagram is given showing the number of back-to-back houses and through houses erected on an acre of land under the different regulations. In Halifax the blocks we illustrate give about 56 houses to the acre; at Keighley, plan Z¹, 59 houses back to back; plan Z², 48 houses to the acre. This diagram is worth study, and indicates that under the most desirable regulations a population of 184 to 207 to the acre is obtained, a crowding decidedly high, though the arrangement is according to the model code.

We cannot afford space to enter into the other sections of the report, such as structural arrangements; suffice to remark that in relation of the two arrangements of back-to-back and through houses to health, the latter have an advantage, as in a "through" house there are two party-walls and two external walls; but in the back-to-back plan each centre house has three party-walls and only one external wall. The walls also in this latter class are sometimes only 4½in. in thickness and not carried through the roof, the evils of which are apparent. As regards ventilation of these houses, local by-laws are not sufficient, and in many of the houses the upper rooms are lighted and ventilated by skylights alone. The report enters minutely into the several details of ventilation, disposal of refuse, amount of accommodation, as they are found in the several towns. As regards accommodation, the table shows that the "through" houses have a rather larger area of living and scullery and bedroom. As to relative cost, the authors, who have gone very elaborately into the matter (see Table V.), conclude that the difference between a "through" and back-to-back house, each of the same accommodation, and built equally well, is only £5 in favour of the latter type of dwelling, or about a penny per week less rent. The figures as to cost have been compiled from those furnished by the local surveyors. Of course the price of land is material, and has influenced the erection of the back-to-back house.

The report exhibits considerable labour and expensification, the results thrown into the scales are valuable, and ought to be studied by those interested in the question of housing the growing population. The conclusion to be drawn from the report is obvious. It is quite clear that the Local Government Board should withhold their permission to the erection of houses on the back-to-back principle, and should not sanction any by-laws that would allow so gross a violation of sanitary construction.

## Engineering Notes.

**THE RIBBLE NAVIGATION WORKS.**—Mr. B. Sykes, the engineer, has issued to members of the Preston Corporation his comments on the report and evidence of Mr. Abernethy, C.E., and the opinions of Mr. Giles, M.P., Mr. W. H. Meeler, Mr. James Deas, and Mr. John Fowler, engineers, who were called before the Select Committee on behalf of the Corporation. With regard to the opinion of Mr. Abernethy that the extra width of channel at Lytham is undesirable, Mr. Sykes shows that the extra width was suggested by Stephenson and Son in 1838, and that the line then laid down in the preliminary plan was precisely the same as that fixed by Sir John Coode in 1883, only the line is extended a half-mile further seaward. Mr. Sykes maintains that the design and works are of a great credit to the Corporation and all parties interested in them. Without fear of contradiction, they are, he says, the cheapest ever constructed in any part of the world. The workmanship has been good, and the works have been carried out within the estimate. It would have cost the Corporation £45,000 more to have carried out Mr. Abernethy's suggestion to line the front of the dock walls with ashlar. Mr. Sykes declares that the locks are perfectly safe and secure. Communications from Mr. Walker, contractor, and his proposals were laid before the Ribble Committee on two or three occasions. They were all considered, and it is thought undesirable to interfere with Mr. Walker's contract in any way. The town council have, by a narrow majority, since rejected the proposal of the Ribble Committee to have an interview with Mr. Abernethy with a view to adopting his report as the basis of a new Bill.

### CHIPS.

A massive cross of white Sicilian marble, standing 5ft. 8in. high, and discernible for miles around, has been erected upon Lliwedd ridge, one of the best spurs of Snowdon, as a memorial to Mr. Alfred Evans, the young Liverpool solicitor who was killed on Whit Monday when making the ascent of the mountain from the Capel-Curig side. Messrs. Roberts and Co., of Carnarvon, have executed the work.

Prince Albert Victor will visit Manchester on 20th prox. for the purpose of inaugurating the Oldham Lads' Club, Livesey-street, and laying the chief corner stone of the new buildings in connection with the Ancoats Hospital and Dispensary.

A stained-glass window has just been erected in Michael's Church, Helensburgh, in memory of William Ruddock. The window is the work of Messrs. Shrigley and Hunt, of Lancaster.

Count von Moltke witnessed on Saturday the unveiling of the Victory memorial at Leipsic. The monument, which has been designed by Professor Meunier, of Berlin, is the largest in Germany, with the exception of the monument to Frederick the Great and the Niederwald monument.

Renewed efforts are being made to raise funds to complete the restoration of Peterborough Cathedral. Canon Argles has promised a second subscription of £500, in addition to £1,200 given by the bishop for a throne and choir pulpit, and another £500 for other special portions of choir stalls. Lady Elizabeth Villiers has given £200 towards choir stalls. Collecting boxes placed in the Cathedral have realised £965.

On Wednesday week Colonel Ducat, one of the members of the Local Government Board, held an inquiry at Kippax into a proposal on the part of the Tadcaster Union Rural Sanitary Authority to construct a system of drainage for the village, and an outfall into the Sheffield Beck, at a cost of £2,200. Mr. M. Paterson, C.E., Bradford, is the engineer.

## Building Intelligence.

**GLASGOW.**—The Queen formally opened on Wednesday the new Municipal Buildings, erected from designs of Mr. William Young, of London and Glasgow, which, it will be remembered, were chosen in competition. The building is Italian Renaissance in character, and covers an area of 238ft. by 247ft., with an internal quadrangle 94ft. by 87ft., approached by carriage entrances. The structure is generally four stories in height above the level of the street, the altitude of the walls being 75ft.; but the angles are carried one flat higher, and are crowned with octagonal cupolas 125ft. high at the apex. In all the fronts the corners and centres are pronounced by being set forward to the building-line, and the intermediate parts are recessed some 8ft. The ground and first floors are treated throughout as a rusticated basement for the pile. The central tower is 50ft. square at base, and rises to a height of 240ft. It is faced with stone from Polmaise and Dunmore Quarries, backed by brickwork, the base and some of the internal columns being of Aberdeen granite from the quarries of Mr. Fyfe, the other internal polished granite work having been obtained from Shap. Messrs. Morrison and Mason are the contractors, and Mr. E. C. Morgan has acted as clerk of works. Mr. John Mossman, of Glasgow, has executed the carving from the architect's models, with the exception of the pediment in the chief façade, that to George-square, which represents the Queen receiving the homage of representatives of the British Empire, and has been executed by Mr. G. A. Lawson. The total cost has been £530,000. Mr. Young's designs were illustrated in the *BUILDING NEWS* for Sept. 15 and Nov. 10, 1882, and Jan. 16 and May 1, 1885, and two of the figures in spandrels in our issue of Sept. 16, 1887.

**WINDSOR CASTLE.**—St. George's Chapel, Windsor Castle, which has been closed for nearly a fortnight for cleaning and repairs, was reopened on Sunday morning for Divine service. A stained-glass window, adorned with the arms and titles of 12 Knights of the Garter, has just been placed on the north side of the nave. An interesting piece of ancient tapestry now adorns the wall of the south side of the reredos. The needlework was recently found in the library of the Dean and Chapter, and is said to have been originally presented by Lady Mordaunt to the chapel in the time of King Charles II. The subject is the Saviour supping with the two disciples at Emmaus after His resurrection, and the tapestry, according to Canon Dalton, is supposed to be a copy of a picture painted by Titian in 1520. If such is the case, the face of the Saviour is a portrait of the Emperor Charles V., uncle of Catharine of Arragon, who married Henry VIII., while the faces of the disciples seated at the table are likenesses of the Emperor's son, Philip II. of Spain, and Cardinal Ximenes, the Prime Minister of the latter Sovereign. The tapestry is hung opposite the projecting window of the Queen's closet. The cleaning has been executed by the chapel officials and workmen, under the supervision of Mr. Nutt, the clerk of the works to the Dean and Chapter.

At the half-yearly meeting of the Barry Docks and Railway Company held on Friday, the engineers' reports were presented, showing that the breakwaters, earthworks, and masonry of the docks and basin were nearly completed. The foundations of the coal tips on the north side were finished. The tunnel by St. Fagan's was nearly completed, that by Pontypridd completed and lined, and the junctions had been laid by the Taff Vale Railway. The hydraulic pumping engines were ready for erection, and without doubt the dock would be open next year.

The parish church of Countisbury, Devon, was reopened by the Bishop of Exeter after undergoing the first section of a restoration. For cramped and narrow pews, in which it was impossible to kneel, seats in pitch pine have been substituted. It was found necessary to provide an entirely new floor, as well as new panelling around the walls of the nave. The entrance porch has been widened, and a new door, lectern, and reading-desk provided. Messrs. Jones Brothers, of Lynton, were the builders.

### TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the *BUILDING NEWS*, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

### TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.). To India (via Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

### ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

### SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

### NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX, XL, XLI, XLIV, XLV, XLVI, XLVII, XLVIII, XLIX, L, LI, LII, LIII, and LIV may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—L. S. B.—G. E. B.—H. and L.—C. Co.—B. and P.—B. B.—W. H. M.

## Correspondence.

### "PRIESTLEY AND ANOTHER v. STONE."

To the Editor of the *BUILDING NEWS*.

SIR,—In order to understand clearly the judgment of the Courts in this case, it is necessary to bear two facts in mind which, once clearly established, the judgment follows as a natural sequence. These facts are simple enough in themselves. They are (1) that the quantities are prepared for the benefit of the building owner, and (2) that he pays for them.

(1) The quantities are prepared for the owner for precisely the same reasons that the plans and specification are prepared for his benefit, and they are all means to the same end—namely, the building that is wanted. The builder uses the quantities; but the use he makes of them is of the same nature as the use he makes of the plan and specification, and it is as rational to contend that the one is for his benefit as to contend that they are all for his benefit, and it has never been asserted that the latter are prepared for him.

(2) The owner pays for the quantities, and the law recognises this so clearly that it authorises the architect to order them on his behalf without consulting him in the matter at all. Whether the surveyor receives his fees directly or indirectly matters not: the contractor may or may not be the conduit pipe; the money in all cases comes out of the owner's pocket. And, these facts being admitted, the decision follows, so to speak, as a matter of course, being based on a principle which underlies, it seems to me, both law and common sense, and that principle is this: that duty and liability are owing to those who employ us, and pay us for our work, and to those only. But it will be

urged, the contractor must be protected, or protect himself from the negligence of others. Undoubtedly he must, and to ask him to base his estimate upon certain quantities, and then exclude them from the contract, is neither fair nor reasonable, and in the conduct of business outside the building trade there is nothing analogous to such a practice. Unfortunately for the plaintiffs in this case, they entered into a contract which was condemned in open court, and in unmeasured language, by their own witnesses. These witnesses, as Mr. Justice Stephen observed, played the part of Balaam to the learned counsel who called them. Instead of cursing the enemy, they "rounded"—if I may use the expression—on their friends. I take the opportunity of protesting against a paragraph in your article (*BUILDING NEWS*, Aug. 17): "The plaintiffs soon found that the quantities were very deficient." Will you allow me to say that if the defence had been heard upon its merits, I should have brought a string of witnesses, including four Fellows of the R.I.B.A., to prove that the quantities prepared by me did not, and could not be made to, apply to the church as executed, in consequence of alterations made after they were taken out. I may also add, in passing, that I was sued for items which were omitted by the express instructions of the architect. It is quite true that there may have been original vices; on the other hand, there may have been excesses. There is nothing unreasonable in this assertion. There is the well-known case of "Scargill v. Shoppee and Young" in point. Here the defendants, after being threatened with an action for deficiencies, had to defend one brought against them for excessive quantities. Truly the mariner's course between Scylla and Charybdis was plain sailing compared with the quantity-surveyor's course in these days of competition. There is first the client who wants full value for his money and as much more as he can get; then comes the architect, the burden of whose song is something to this effect at starting: "The estimates come out very high; I feel certain your quantities are largely in excess." At completion: "Why in the world did you cut things so fine?" Lastly, there is the contractor, who watches the bills as the work proceeds with an Argus eye for the "short" quantities, and a blind eye for the "long,"—a blind eye which Nelson himself might have envied. The allegation as to negligence was made, and, of course, it may be true; but the paragraph quoted above is unfair, and in the face of the judgment unjust. Lord Justice Lindley—who heard all that special pleading could urge against the quantities, and hardly a word in their defence—concluded his judgment by saying, that in his opinion there was no evidence of want of reasonable care.

I turn with relief from a dry and dreary subject, as Mr. Meadows White justly called it, to something a little more entertaining. And that is the suggestion of your contemporary, that the quantities should be left entirely in the hands of the builder. In these days of keen competition and cutting prices, to allow him to order the quantities will be oil to his wounds and balm to his harassed soul. It is pleasant to picture the quantity surveyor of the future—a little obsequious, perhaps, but otherwise very cheerful and expectant—waiting at the builder's office for the purpose, let us say, of adjusting the final accounts. And what a happy adjustment!—no niggling over half-inches, no squabbling over the girth of this moulding or the projection of that cornice—no hair-splitting, in a word, about trifles. And what a "high" time for the surveyor as well! The miserable 1 or 1½ per cent. which at present constitutes the solatium for all his cares and troubles would expand into a good round five, or, under favourable conditions, even into double figures—for, of course, the building owner would have to pay. Under these circumstances the Modern Babylon would become a sort of builder's paradise, and a very deserving, if somewhat prosaic, class would be at once translated to realms happily not beyond the skies, nor even beyond the flight of Mr. Baldwin's parachute, but, at all events, where "bills" are unknown and pay-day has no terrors.—I am, &c., FRED. STONE.

SIR,—As sooner or later we ape your business habits at this side of the Channel, particularly they are worse than our own—just as the

ladies at your side adopt French fashions—we are also interested in the results likely to arise from the decision in the above case. Is not Mr. Arthur H. Spokes entirely astray as to "the practice at present adopted in the building trade" as to how builders get quantities? He assumes that the practice is that they get them from or through the architect, as in the above case, which I think quite exceptional in that respect and others, for not only were the quantities issued from the architect's office, but he does not appear to have denied that the specification was not written when the quantities were taken out, and that the drawings were altered after they were taken out, or, still worse, that he directed work to be omitted from the quantities that had to be executed under the contract. I know that the practice is not followed by us, and that it was not general at your side some time ago. And as it appears to me that the decision in the above case mainly turned upon it, I am anxious that it should not be overlooked. The, to the lay mind, rather foggy phrase, "No privity of contract," I suppose means that the parties not coming in contact there could be no understanding or agreement between them. But if the general practice is that the quantities are supplied direct to the builder by the surveyor, even when he is selected by the architect, surely there must then be privity of contract between the party who supplies them and is to be paid for them, and the party who receives them from him and is to pay him for them.

Indeed, it is densely foggy to the lay mind how there was sufficient privity of contract for the surveyor to enforce payment of his fees and not sufficient for the builder to recover for loss from errors in the quantities for which the fees were to be paid. However, if the fact of the quantities being supplied direct by the surveyor to the builder and payment for them would not establish privity of contract between them, builders should refuse to accept quantities unless there was added to the usual items at foot for surveyor's fees something to this effect—"To be paid by the employer if no tender is accepted, or by the builder whose tender is accepted out of the first instalment, and in consideration of which the correctness of the quantities is hereby guaranteed by me (or us), and my (or our) liability acknowledged for any loss from errors in them to the employer or builder."

Lawyers are, naturally, opposed to fixing responsibility on any professional man for the due discharge of the duties he undertakes and takes payment for. They so frequently fail to fulfil the duties for which they receive their fees, and they rarely, if ever, master the details of a complex building case.

You were quite right in saying that the method described of fixing responsibility by making the quantities part of the contract, so that the employer would be liable to the builder, the architect to the employer, and the surveyor to the architect, would be "round-about"; for indeed it would be the old game of sending the fool farther, and would not of itself in the slightest degree aid in improving privity of contract, while it would open the floodgates for fraud and jobbery for those who fish in foul waters, and it is quite easy otherwise to counteract the evil effects of the decision in "Priestley v. Gurney."—I am, &c., Limerick, August 18. M. M.

#### STRAINS.

SIR,—With reference to Col. Seddon's letter reflecting upon Mr. Middleton's theory of the shearing stress in the centre of a uniformly loaded girder, it is a serious matter for students to be misled, as they have to answer such questions at Civil Service competitions, and the loss of a few marks means—a place.

I have never seen so strange a theory advanced before, and I am sure there are many like myself who would feel indebted were some recognised authority to set the matter at rest.—I am, &c., S. H. G.

SIR,—Mr. Middleton, in a footnote to his last article, in your issue of the 17th inst., still maintains his theory with respect to the shearing stresses in the centre of a beam supported at both ends, and loaded at more than one point. Will he kindly prove what he states—viz.:—That the first load which is met by one

of the reactions only diminishes that reaction by the portion due to that load. The statement in his answer the same week to Col. Seddon, that effects must travel to their causes, is merely an assertion, and no proof. It would also be interesting to know who first discovered this.

I must apologise for again troubling you on this subject, but it is necessary that this new theory should be proved before it can be accepted as a fact.—I am, &c.,

FRED. G. EDWARDS,  
120, Leighton-road, Kentish Town, N.W.,  
Aug. 18.

[Col. Seddon also sends a reply to Mr. Middleton's letter, which cannot appear till next week, as there is not time to engrave the necessary diagrams. Mr. Middleton had better postpone any further reply till Col. Seddon's letter has appeared.—Ed. B.N.]

#### WANTED, A PROTESTANT CONTRACTOR.

SIR,—I inclose an advertisement from the *General Advertiser* of last Saturday, which is rather behind the times:—

TO PROTESTANT CONTRACTORS.  
TENDERS will be received up to Twelve noon on TUESDAY, 28th inst., for the  
**REPAIRING OF THE CHURCH TOWER**  
at CARNREW. Particulars on application to the undersigned.  
N.B.—The lowest or any tender not necessarily accepted.  
CHARLES SYMES, Sec.

About 20 years ago it was no uncommon thing to see the notice that "No Papists need apply," but the parties having charge of the repairing of the church tower at Carnrew are determined that it shall be in the hands of an orthodox builder; but, hold!—they do not mention the exact form of Protestant. In order to make the matter complete, they should advertise for a contractor with Evangelical views, who only employs Evangelical workmen. Then they might rest content that the repairs of their tower were in good hands.—I am, &c., Dublin, Aug. 22. J. L. R.

#### BARFRETON CHURCH AND CHURCH RESTORATION.

SIR,—There is a more interesting connection between the letters on these subjects than might at first appear; and there is no doubt that we all agree with "M." in his anxiety about a church for which we must all have so great an admiration. This anxiety is, that nothing should be done beyond what is really structurally necessary to preserve it, with a due regard to arrangements for the proper and dignified performance of divine worship. These conditions will, I confidently trust, be observed when the works of repairs are one day carried out under the architect, Mr. J. P. Seddon. I have referred in my "essay" to the desirability on some occasions of our mutually helping each other when any difficulties might arise in our work, and I instanced the case of Gerona Cathedral, where the "Junta" (not "Penta") of architects, twelve in number, consulted with and advised the architects of the intended new nave. It will, therefore, be of interest to "M." or perhaps to others, to hear that a "Junta" of architects, in the shape of the R.I.B.A. Arts Committee, have recently discussed, by his special desire, with Mr. Seddon, the sketch plans which he had prepared for Barfreton church. There were, of course, some differences of opinion in points of detail in Conduit-street, as there were at Gerona; but all were agreed on such essential matters as the preservation intact of the very ancient western wall, the old roof, and other architectural features, with only such reparation as should be clearly necessary. I may add that, as far as we know, no scheme of opening the arched recesses was contemplated, and your correspondent must, on this point, be mistaken. In the end, we all agreed with Mr. Seddon's cordial expression of opinion that it would often be very advantageous if some such similar consultation with professional brothers were held in other cases, where any difficult questions might have arisen in a church architect's practice.

The R.I.B.A. "Arts Junta" will, we need hardly say, most cordially give any assistance in their power to carry out the objects aimed at in the now re-issued "Suggestions and Hints on Church Restoration."—I am, &c., R. HERBERT CARPENTER.  
4, Carlton Chambers, 4, Regent-street, S.W.

ARCHITECTURAL PLAGIARISM.

SIR,—There is much to be considered in Mr. Hall's letter in your issue of the 17th inst. on the subject of "The appropriation of the ideas of others"; but, on the one hand, why do architects and students take the trouble to journey to the Continent and sketch the picturesque buildings and so carefully measure their details? Do they as carefully abstain from introducing any selections therefrom into a proposed town hall, church, hotel, &c., for which they have a commission? Do they ever fix the words, "with selections from the Hotel de Ville, Notre Dame, or any other building?" Did St. Peter's at Rome afford any aid to Sir Christopher Wren when he designed that noble edifice St. Paul's? Do any of our modern buildings in London resemble those on the Continent?

An architect goes abroad in order that he may improve himself by the selection and study of those buildings which he most admires, and which have been upheld by the profession at large. When he returns to his office, are these drawings of any service to him? and is any reference made to the names of the architects of the buildings which have been so carefully drawn? During a period of over 20 years' private practice, I have only heard of very few instances.

Again, when a building is handed over to public or private use, any person is at liberty to use his sketch-book and 24 inch gauge thereon, if he can get permission; and, after all, I do not perceive the difference between using it in England and on the Continent.

As regards "piracy of ideas," it is difficult to draw the line—as to a greater or lesser degree. If a bay of a public building like that of those mentioned by Mr. Hall was actually produced elsewhere, "piracy" would be a mild term for it. Perhaps "copyright" could be brought to bear, if the design were registered.

It is very hard on the author of a noble building when he has spent so much time and money on its production if any material points therein have been uncereemoniously abstracted and transferred to another man's work.

As the *locus in quo* of the building in question has not been made known, it is impossible to form an opinion of it. Doubtless some other professional will have a few words to say, which I shall look for with interest next week.

France.—I am, &c.,

H. T. PERCIVAL,  
Architect and Engineering Surveyor.

TEST OF A PASSENGER LIFT.

SIR,—This test had reference to the safety of one of our Reliance Suspended Lifts. To make clear its significance it is necessary to refer to the frequent failure of so-called "safety gears" when unexpectedly called upon under working conditions, even though such gears have satisfactorily passed a form of test at the time of erection.

The explanation of the discrepancy between the behaviour under test and under working conditions may be found in the nature of the test applied. The usual course is to suspend the cage by means of a short piece of temporary rope, which is cut through close to the top of the cage, the grip gear being previously well oiled, and everything ascertained to be in working order. These are conditions under which almost all safety gears would act; but conditions which never exist in practice, and hence the disappointing result.

When a rope or chain breaks in actual work it is because it is worn out, and the point of fracture will be that of greatest wear, but will never be close to the cage. In the case of a hydraulic lift with multiplying cylinder, this point will be found somewhere among the wheels of the cylinder. In the case of a lift driven by winding gear, it will be found in that part of the rope passing over the drum or wheel.

In all cases the fracture will occur at some distance from the cage, with the loose ends entangled among the machinery, and probably the heavy weight of loose rope or chain hanging from the off side of the overhead wheel, jamming the safety gear out of action. Before the safety gear can act it must pull the loose ends through the machinery, sometimes over or under six or seven wheels, and lift up the dead

weight of rope referred to. If not sufficiently powerful for this duty, it will allow the cage to fall, restrained only by the back drag of the rope which is preventing the action of the grips. This explains a peculiarity attending many lift accidents—viz., that though the cage has descended from a considerable height, the speed attained does not approximate to that due to free fall. We know of one case in which a man fell 60ft. in a lift cage, and was walking about within a week apparently uninjured.

The ordinary safety gear has the additional defect of being normally held fast in one position, and at the critical moment may be found to be set fast.

Passing now to the special test under notice, it is only necessary to premise that the "Reliance" gear is designed to act upon the failure of any one of the lifting ropes; that it has for its motive power the weight of the cage and load, so that the greater the load the greater is the effectiveness; and that it is actuated by the opposing pull of two ropes in a series; that is to say, should a given rope break, the safety action depends upon the tension of one particular rope among the survivors, each rope having its own proper opponent. It follows that should any pair of ropes be relieved of tension by the tightening of the remaining ropes, and that then one of the slack ropes should be fractured, its complementary slack rope would be in the worst conceivable condition for actuating the grips.

The lift tested was worked by a hydraulic multiplying cylinder, fixed at the bottom of the building. The rise of cage was 88ft., the load lifted 11cwt., and the weight of cage 10cwt.

The safety-gear had remained without special attention for nearly two years; it was taken just as found, and not even oiled. A pair of ropes was purposely slackened as above described, on the assumption that a careless attendant might make such a mistake. The cage was taken to the top of the building and left empty—i.e., with the smallest motive power for the grips. The point of greatest wear in the rope was calculated and checked by observation, and found to be 150ft. away from the cage end, having five wheels between it and the cage. Of the 150ft. of rope 100ft. hung vertically, representing a weight of 50lb. pulling against the gear. Under this accumulation of adverse conditions, one of the slack ropes was then cut through, 150ft. away from the cage, with the result that the safety-gear went into action, preventing the descent of the cage when the valve was reversed for lowering. The cut rope was then replaced by a new one, and all the ropes were adjusted to equal tensions. The cage was again taken to the top of the well, and loaded with 5cwt. of iron representing an average load of passengers. These conditions were a nearer approximation to those of ordinary working, and altogether more favourable to the safety apparatus. A second rope was then cut at a similar point measured 150ft. from cage, resulting, as was expected, in an even sharper and more decisive locking of the gear than in the first experiment.

A duplicate set of gear was tested with a ton of iron in the cage, with equally satisfactory results.

As already intimated, the ropes had done nearly two years of incessant work. A piece was cut out of the worst part of one of them and sent to Mr. Kirkaldy to test to destruction. Appended is a copy of his certificate.—We are, &c.,

ARCHD. SMITH AND STEVENS.

"Results of experiments to ascertain the tensile strength of one piece of steel wire rope, with fastenings, received from Messrs. Archibald Smith and Stevens:—

Test No.	Circumference in inches.	Hemp Core.	Ultimate Strength.		Position of Fracture.
			lbs.	tons.	
W 1318	1 90	Main & Strands	15,495	6·92	Two strands broke together, others separately. All clear of fastenings.

"The rope having been in use, and having broken wires, the extension was consequently not taken.  
(Signed) "DAVID KIRKALDY AND SON,  
"99, Southwark-street, London, S.E."

Intercommunication.  
QUESTIONS.

[9723].—Portland Cement Slabs.—We should be very obliged if you would ask the following questions in your Intercommunication Column:—What is the largest size to which a slab can be made in Portland cement or concrete carefully manipulated, without danger of cracking? Would it be safe to make a slab in cement or concrete 6ft. x 3ft. x 6in., so that it might be guaranteed against cracking in the course of time or in transport?—W. J. BENNETT.

[9724].—Quantities.—In last week's part of the excellent series of articles now publishing on this subject I note that the joists of all the floors above the basement are provided "notched" on to wall plates. Is this necessary, and does it serve any useful purpose? They are taken in the quantities as "framed." Is this right to take merely notched joists as framed?—B.

[9725].—Malt Kiln.—It is intended to lath-and-plaster the roof of a malt-drying kiln. Can any of your readers give me the best way of doing same to prevent the heat drawing off the plastering when drying malt?—SUBSCRIBER.

[9726].—Filtering Bed.—Will any of your readers inform me the best way to make a filtering bed in one compartment of a galvanised tank holding 200 gallons divided in the centre? The tank will be buried under ground, and the filtered water conveyed by its own gravitation to a dwelling house 100 yards away.—B. C.

REPLIES.

[9700].—Quality of Woodwork.—Having had more than fifty years' experience in the use of the various kinds of timber imported, I can only partially agree with the writer in last week's "B.N." on this subject. I find the quality of timber and deals now used in building much inferior to that formerly employed, the reason being simply its cheapness to the builder without a corresponding benefit to the employer. The best timber for carpentry is Memel, of which there are several qualities—crown, first, second, and third; and for joinery, Petersburg deals, of several qualities, selected according to the proportion of sap and knots. Also, for internal woodwork, Gelfe deals are very satisfactory. The timber now in use is much inferior to the above. Pitch-pine for carpentry is not of equal strength with Memel, is not so durable, and is very inflammable. Swedish timber is of less strength, and if exposed to weather, of short duration. The general run of Swedish deals, if used in small scantlings for carpentry, is very deficient in stamina, and in some situations quickly decays. In framing of doors and suchlike work, it will not retain its shape, but twists to a serious extent; and further, it is very productive of dry-rot, as witness the number of inquiries on this subject in your paper. Of all abominations there are none greater than the foreign-sawn boards, more especially floor-boards, which are the veriest rubbish. The best deals in use in my early recollection were Archangel. I have seen them placed in the most trying situations, and after fifty years they are perfectly sound. This article is not in the market now, but a spurious substitute has been sold under that name. If good and durable work is required, Memel timber and Petersburg deals will give a satisfactory result, even with a moderate amount of sap and knots.—DURABILITY.

CHIPS.

The parish church of Tattenhill, near Burton-on-Trent, is about to be restored, from plans by Messrs. Bodley and Garner.

A receiving order has been granted in the case of Walter Graves, Winchester House, Old Broad-street, E.C., architect and surveyor.

The foundation-stone of schools to be erected in connection with St. Alphonsus Roman Catholic Mission, Great Mersey-street, Liverpool, was laid on Friday by the Bishop, the Right Rev. Dr. O'Reilly. The available land is of so limited an area that to provide the required amount of accommodation for 800 school children it has been found necessary to erect a building three stories high, the basement being partly sunk below the street, and constructed to form a playground. The cost will be about £3,000. The architects are Messrs. J. and B. Sinnott, of Liverpool.

The Spanish Government has ordered its engineers to report on the condition of the cathedrals at Burgos, Barcelona, Leon, and Santiago, which are in an unsatisfactory state, until Parliament can vote in the autumn session the supplies necessary for the repairs of the cathedrals. Subscriptions are fast coming in for Seville Cathedral, which will require £30,000 and several years to rebuild the part of the nave which recently fell in. The ruins are being cleared away.

A new Congregational Church has just been built at Newquay, Cornwall, from plans and designs by Mr. Silvanus Trevail, M.S.A., of Truro.

The foundation stone of a mission church was laid at Wootton, near Almeley, Herefordshire, on Monday week. The building will be of stone, and will measure 36ft. long by 18ft. The roof will be ceiled, and covered with Broseley tiles. The cost is £220, and the builder is Mr. B. A. Hamer, of Kington.

The church of St. Alkmound, Shrewsbury, has been reopened after decoration in colour of the chancel, by Mr. J. Robinson, of that town.

### WATER SUPPLY AND SANITARY MATTERS.

**CAPE TOWN SEWERAGE.**—The authorities of Cape Town, as is well known, have had considerable difficulty in connection with the sewage and sewage disposal works for that city, and, although the cost must be of enormous magnitude, nothing yet appears to have been definitely done to remove the difficulties consequent upon such a state of things as at present exists. After considering numerous proposals to deal with the sewage, the municipality of Cape Town have finally retained the services of Mr. Edward Pritchard, M.Inst.C.E., of London and Birmingham, who has gone to the Cape to make a personal inspection of the district, and prepare a comprehensive report thereon.

**SEWAGE DISPOSAL IN FORFAR.**—We have received a brief account of the sewage disposal of this town, written by Dr. William F. Murray, F.R.C.S., Medical Officer of Health, from which we gather that the scheme has been eminently successful, the plan carried out being disposal by filtration through land. Forfar has a population of 15,000 inhabitants, and, being in a basin in the valley of Strathmore, has presented great difficulty in the disposal of its sewage. Mr. Willet, C.E., Aberdeen, was engaged to report on the available outlets for sewage, and to carry out a system of sewerage. For this purpose Messrs. Bailey Denton and Co., of London, were called on to advise, and the intermittent filtration principle of those gentlemen was adopted. Mr. Willet found that pumping was necessary, and a small estate of 40 acres was purchased. Here the sewage falls into two screening tanks communicating with a well, from which the sewage is pumped. The outfall sewer, two feet in diameter, is capable of delivering 2,000,000 gallons of sewage per diem. It has overflow weirs to relieve the pressure during heavy rain storms. The sewage is lifted 50ft., and when it arrives at the top of the bank Mr. Bailey Denton's scheme is carried out. The land at Forfar which receives the sewage is sandy and gravelly, and is limited to 24 acres out of the 40 acres. Upon this land the intermittent downward filtration, combined with surface irrigation, has been tried with marked success. There are seven acres devoted to intermittent filtration, and 17 acres left for wide irrigation. The loch belonging to the Earl of Strathmore was, before the present scheme was tried, polluted by sewage and the refuse of bleach works. To avoid super-saturation of the land, a main under-drain, with branches, is laid, which keeps down the subsoil water and secures the essential condition of porosity, so that the liquid can percolate. The filtration areas are laid out in a series of terraces, each perfectly level, intersected by main furrows and branch furrows cut at right angles, the former being cut deeper than the branch furrows, so as to allow the solid floating matter to deposit in them. Between the furrows the ground is planted with vegetables. The filtration areas and the delivery of the sewage to them are arranged so that each terrace can receive its quantum of sewage separately from the rest, according to the quantity of liquid to be disposed of. By this means the intermittent application of sewage and the consequent oration of the soil are maintained. From the figures we have received the financial success of the scheme is beyond doubt. From 15th of May, 1887, to May, 1888, the gross income from farm, including rent of house, is £432 19s. 11d. The expenditure, including rental of 40 acres at £1 10s. per acre and interest on £1,500, amounts to £350 6s., leaving a surplus of £82 14s. 10d. Equally satisfactory are the figures given of death rate. For the last two years the rate has been exceedingly low: 14·2 and 15·4 per 1,000 respectively. The analysis of Dr. A. P. Aitken, Chemist to the Highland Society of Scotland, is very satisfactory. The doctor observes, in a letter to Dr. Murray, "I regard the above results as a remarkable example of the excellence of intermittent downward filtration method, when carried out under favourable conditions," and adds he has seen no place where the sewage disposal is so well settled as at Forfar; and recommends corporations who have the sewage difficulty to face to inspect the works.

**WATER OF LEITH DRAINAGE SCHEME.**—The Edinburgh Town Council have received a report by Messrs. D. and T. Stevenson, C.E., regarding the new intercepting sewer for the Water of Leith Drainage District, proposed by the burgh engineers. The distinguishing feature of the scheme is that the Water of Leith is divided into two portions; the smaller and lower portion is to be accommodated by the existing sewer, while for the larger and higher portion a new main sewer is to be constructed. Messrs. Stevenson consider that the proposed drain is of ample dimensions throughout Edinburgh for the present and prospective wants of its own district within the municipal boundary; but a portion of the drain at the Leith end requires to be enlarged and other minor alterations made. Their estimate for works alone, in the absence of working drawings, irrespective of enlargement, amounts to £61,600.

### Our Office Table.

A PROTEST is made in the columns of the *Times* against the proposal of the Exhibition Commissioners to destroy, *more suo*, the amenities of the Albert Hall by removing the arcade, flight of steps, and conservatory on the south side to make room for two blocks of residences in flats. It is suggested that, even if the conservatory must go, the arcade, with its excellent terracotta ornamentation, and the steps might be retained, and, at the least, the proposed flats to be erected on the site of the quadrant terraces might be brought forward so as to give a *minimum* space at least equal to the conservatory between their backs and the Albert Hall. If the present plans be carried out, the "architectural merits" of the Albert Hall will be permanently impaired by crowding against its south side a series of incongruous domestic buildings. The Commissioners will, however, we anticipate, as recklessly destroy the architectural properties of the Prince Consort's memorial as they have sacrificed the horticultural gardens and the seat-holders' interests in the hall itself to their desire for gain. When a Royal Commission inquires into the doings of the South Kensington authorities, some piquant revelations may be anticipated.

SIR J. C. ROBINSON claims, and with considerable reason, that the result of the recent scientific investigation and experiments at South Kensington into the effect of light on water-colours has been to confirm his contention that many colours used in such drawings fade when exposed to sunlight. The novel and important point brought out in the inquiry is, as he shows, that all pigments are alike stable in a vacuum, thus indicating the real cause of the bleaching process produced by daylight—the action of the oxygen contained in the air, an action which, broadly speaking, goes on in the light only, being inoperative in darkness. If the commissioners are right, the simplest mechanical contrivances may hereafter insure eternal durability to water-colour paintings, and no time should be lost in verifying the efficacy or the contrary of the remedy. If the entire exclusion of atmospheric air should prove to be the sole condition for securing exemption from fading, surely it ought to be a simple matter to practically preserve drawings in a vacuum under glass. It would be a mere question of secure framing; possibly merely placing the drawing betwixt two sheets of glass in close contact with them under pressure, the edges of the glass being then hermetically sealed, might suffice.

MR. WILLIAM EASSIE, F.L.S., F.G.S., well-known as a sanitary engineer and an advocate of cremation, died on the 16th inst. at his residence in South Hampstead, aged 56 years. Fourteen years since, in conjunction with Sir Henry Thompson, he founded the Cremation Society, and he has since acted as its honorary secretary and the editor of its *Transactions*. In early life he entered the engineering profession, and was engaged as assistant to the late Sir I. K. Brunel. Along with the late Dr. Edmond Parkes, he superintended the sanitary arrangements of Renkioi Hospital during the Crimean War. At the conclusion of hostilities he took a band of navvies and made the first excavations on the site of old Troy. In 1872 he published "Healthy Houses," and subsequently a work on "Sanitary Arrangements for Dwellings." Mr. Eassie took an active part in the establishment of the Sanitary Institute of Great Britain; he was a member of its council and of its examination board until his decease, and frequently read papers before that and other similar societies.

ELIZABETHAN and Queen Anne architects would do well to include in their summer tour a visit to the collection of the late Mr. Thomas Lidstone, diocesan surveyor, made by him during the demolition of the ancient streets of Dartmouth, and in his long and varied experience in that neighbourhood in both Church and domestic architecture, and which is now on view at the Gymnasium, Dartmouth, a building 55ft. by 27ft., which it fairly fills, under the supervision of Mr. J. Parnell Lidstone and Mr. Robert Cranford, the Library, Dartmouth, from whom tickets to view can be

obtained. Permits to sketch can also be obtained.

MR. JOHN M'LEAN, architect, of Stirling died on Monday night in last week, at the age of fifty years. Originally a mason, Mr. M'Lean had the charge, under the late Mr. Rocheac architect, of the construction of the National Wallace Monument on the Abbey Craig, a work which he satisfactorily completed. He was afterwards appointed Master of Works for the burgh, and in this capacity he designed and partly carried out the feuing of the hospital lands, the drainage and blocking of the streets and other improvements. Latterly he devoted his whole attention to his work as an architect. His works include the Stirling Arcade and Town Hall, Coathill House, and many other buildings, public and private, in the town and surrounding district. Mr. M'Lean leaves a widow and grown-up family.

SAYS the *Newcastle Daily Chronicle*: "A considerable portion of the population of these islands has long suspected archaeology and its vicarities of having a family connection with humbug. At Warwick the learned members seem to have behaved like a parcel of school boys. The Warwick Natural History Society had secured an old vase unearthed during the excavations for the Suez Canal, and the president very kindly postponed the opening of it until the arrival of the Royal Archaeological Institute and its friends. One would think that such a ceremony, conducted under such auspices, would be extremely solemn. Nothing of the kind. The savans gathered round and apparently, banded jests with each other as to its date and nationality. Some said it was Greek, some Etruscan, others Egyptian; while the dates given disclosed, it is said, the trifling discrepancy of a 'thousand or two years.' The best joke, however, was on the subject of the vase's contents. A party, giddier than the rest, suggested 'Nile mud or Egyptian sand,' and drew a fancy sketch of the vase slipping off a peasant woman's shoulder in the interval of 'some episode of courtship,' and being thus forgotten. The vase really contained calceolar bones, which discovery no doubt sobered the venerable excursionists. One little item remains to be noted, however, and perhaps accounts for the unwonted jocularity: *the incident occurred after lunch.*"

MESSRS. WM. WOOLLAMS AND CO., manufacturing paperstainers, of 110, High-street, near Manchester-square, London, W., the original makers of guaranteed non-arsenical wall-papers, invite attention to their stand, D 219 and E 241, at the Irish Exhibition. Wm Woollams and Co. show, in the fixed specimens the designs of an Irish artist, Mr. A. F. Brophy of Limerick. The principal work exhibited is a dado decoration, in Adam's style, called the "Savoy." It is printed in terracotta, No. 2927 facing Avenue D; and in blue, No. 4104, facing Avenue E. On either side of the Avenue I front of their stand, is another dado decoration, Venetian in type, named the "Goldsmith," which is worked in blues, No. S 445, and in yellows, No. S 446; while the sides of the stand in Avenue E are occupied by eighteen different colourings of an all-over well-balanced damask pattern called the "Redcliffe," amongst which No. G 993, in yellows, and No. S 383, in blues are particularly successful. Mr. Brophy, now head master of the Art Department of the Finsbury Technical College, connected with the City and Guilds' of London Institute, was a student of the Limerick School of Art, and gained the only national medal awarded in art to Limerick in 1860. Subsequently in London he gained the gold medal for furniture and the architectural gold medal, and he is one of the examiners of national competition and third grade certificate work at the Science and Art Department, South Kensington Museum.

MR. T. W. HELLIWELL, of 5, Westminster chambers, has issued a catalogue of his well-known system of imperishable glazing without putty, which is now so extensively used in this country and America. The principal railway, the Government, and various public bodies are regular users of this system, which has also found favour among all owners of horticultural buildings. The catalogue contains some useful particulars of Mr. Helliwell's system of zinc roofing, in which no solder is used, nor any holes needful, and of a new trapless wash-out closet, called the "Perfection," which has many advantages.

## AND ENGINEERING JOURNAL.

VOL. LV.—No. 1756.

FRIDAY, AUGUST 31, 1888.

### ADDITIONS AND ALTERATIONS TO BUILDINGS.

THE alteration of one architect's design by another is one of the frailties incident to human hopes, for the restorer very often deals unceremoniously, and anything but tenderly, with the original design. We can recall some glaring instances of alteration, or rather mutilation, in our experience—churches in which the plan has been entirely ignored by lengthening or the addition of transepts, aisles of preposterous width and height, towers and spires of altitude disproportioned to the edifice; in domestic buildings, of extraordinary additions of apartments and offices. Like other professional men, doctors and lawyers, architects prefer to follow their own bent, they do not care about being "second fiddles," the result of which assertion of independent judgment is that we have buildings so completely transformed that their individuality is lost. An alteration of a design is a trouble from which other artists, painters, and sculptors are exempt. Who would dare to try his hand on a painter's work, to tamper with a Raphael, a Reynolds, or a Turner? Buildings combine the utilitarian with the artistic, and as their object is use, the architect's design is sacrificed. From what we know of the practice of the mediæval architects, little scruple was experienced about altering an old building, what was done was done boldly and without hesitation; but they were careful to carry out the original plan as far as possible, and to leave the style of the old intact, preferring to make any addition in the style of their own day, so that of the new portion there should be no doubt, and that those who ran could read. The modern restorer departed from this plan when he began to restore old English churches to the original style—prompted by a mistaken zeal, veneration, and respect for the old structure. But with modern works he has no such conscientious and punctilious feeling—he is neither exact nor precise, and follows the old rule, but without method. If there is a plan to follow he invariably prefers one of his own, the details he tries to alter or improve, or he makes his additions so intensely unlike in style as to create a feeling of disgust or cause a shock to everyone with a sense of fitness or congruity. We see in one church an arcade of pointed arches of rather acute form lengthened by the addition of flat Tudor ones at the west end, or an Early Pointed addition to a building in Late style. Now the old builders, in following their common-sense notion of alteration or restoration, never did anything so ridiculous as to turn a 13th century edifice into one of the 11th century, or introduce a Norman into an Early English or Decorated church, or one of the latter styles into a Perpendicular building. They would never have gone backwards and singled out a style of a century earlier. These are anomalies that have rendered modern architecture and architects supremely ridiculous in the eyes of the intelligent. Turning to instances, we now how Salisbury and Hereford suffered under Wyatt, what barbarous vandalisms were committed under the name of restoration at Worcester and Durham, and scores of other cathedral churches, including St. Albans. One of these ignorant and unintelligent customs was to remove every-thing Perpendicular in style; the flat-pitched roof gave place to a new steep one, groined and ribbed, or more commonly a stained deal

"open-timbered" roof, worse for sound, and often less architectural. The oak panelling and Renaissance details in the chancel were taken down; the chancel itself, the most interesting and time-honoured portion of the edifice, was even removed to lengthen the church, and a modern one built; the Perpendicular tracery was replaced by some of earlier style. We cannot now understand this infatuated contempt for the latest phase of English architecture, the very one which seemed to be in harmony with modern civilisation and reformed doctrines of the Church. We have only to read Murray's "Handbooks" to see how completely our cathedrals and churches have been restored away during the last half-century.

Our object now is more practical. What has been done is past recalling. One of the bitterest enemies of the architect is the unscrupulous builder who is called in to make alterations. He does so without the slightest regard to proportion. His addition of a bay window or a porch, should there be any other from which he draws his inspiration, is to make it a duplicate, a great deal wider or narrower, as the case may be. The way he proceeds is to observe the same details, but to extend the window or door in width, the result being a perfect travesty of the original. Who has not seen an order widened in its intercolumniation, but observing the same proportions of column, a mullioned window extended by placing the mullions further apart, or a gable heightened without any attempt to modify the position of the openings or the treatment of the details. Some time ago we inspected a large house to which the addition of a new wing had been made. The house was designed by a London architect, and bore evidences of careful design. It had a gabled projection at one end of the front; the new addition comprised a gabled projection of similar external character at the other end, the interior rooms consisting of a large drawing-room and bedrooms over. The addition was wider than the corresponding wing, though a repetition of the same features appeared in it. It was evidently a builder's addition. The interior of the new drawing-room was ill-proportioned, the height of the room had been increased. The interior looked meagre and cold compared with the older room on the other side of the house; the builder had copied all the details—the same doorway architraves, the same cornice and chimney-piece—in spite of the fact that the new room was larger and higher than the old one. The cornice looked small and out of character, and the same want of relation was observed between the chimney-piece and the room. It was easy to see where the architect's work ended and the builder's began. Still more painful is the case of an addition to an old design where there is nothing to guide the builder in the design. One example of this was the building of a tower to an Italian residence. The tower was built on one end of the building, and the builder had introduced on three sides copies of the windows of the front of the house utterly out of keeping with it. Even the upper story had a square-headed architrave finished window inserted like the ones under the cornice of the house. The whole design was irretrievably spoilt by this addition. In another case a large billiard-room was tacked on to the side of a house, forming a low wing; it was lighted by a skylight and by two large windows in front; but these were of bad proportion, round-headed, and did not correspond with anything else in the façade, while the balustrade and cornice returned abruptly against the façade on a level with the centre of the windows. The exterior was irretrievably spoilt; the principal room windows were dwarfed, the addition appearing more like a lecture-room or chapel. We

might multiply instances of porches, conservatories, and bay windows that have been added to the detriment of the original design; but who can say anything? The owner can surely do what he pleases; only the poor architect can complain of the transformation or mutilation that has been sanctioned in his design, which he could have avoided if he had been consulted. Perhaps, however, he has only himself to blame for having designed a house without the accommodation. A builder would have little sympathy with the architect's elevation if working to it entailed any labour or skill on his part; he would set to work in the easiest manner, adding here or pulling down there. Owners, unfortunately, do not trouble. The building passes into other hands, and the contemplated additions or alterations are given to another architect, or placed into the hands of a builder. Many a building is spoiled by not being able to obtain the original architect's services. With regard to public buildings, the same failures are repeatedly met with. Unfortunately, plans of schools, hospitals, municipal buildings, are accepted without any provision for future extension; increased accommodation is demanded, an addition is made to the building which completely mars the design by throwing it out of proportion or making it one-sided. The common plan of adding a story destroys the harmony or balance of proportion in nine cases out of ten. Few buildings can stand an addition to their height. An extension in length is more tolerable, provided ground can be obtained and a suitable break made in the elevation; but the least objectionable form of addition is that which has been provided for in the plans by lateral or rearward additions.

The more perfect a building or design, the less capable is it of receiving additions, and the more skill is necessary in the work. It is very difficult, for example, to add to a cruciform church, or one with a perfected plan, without destroying its proportions; the same difficulty is experienced in altering or enlarging a public building whose façades are well balanced. Alteration is in either case more or less a spoiling process. Enlargement or rebuilding is the alternative to which the architect must submit in these days of constant demand for accommodation, and if he can provide in his plans means by which addition can be made, he earns the gratitude of his patrons and the public.

### HALLS AND STAIRCASES.—IV.

AS an addition to the hall, the conservatory is a feature of much beauty. Whether it is made to open out of a vestibule as a sort of adjunct to the porch, or to form the end or side bay of a hall, it can be designed in either case to contribute largely to the size and effectiveness of the entrance. The chief governing consideration is the aspect. A conservatory or show-house, to be really what its name implies, should be so situated as to catch the sun's rays for a certain part of the day at least. A south aspect is best for a lean-to horticultural building, but the western aspect is satisfactory, inasmuch as the latest solar rays, those of the afternoon, being the warmest, can be made economical in retaining warmth during the night. The east is a good aspect for the morning beams, though they pass off before the sun is at its hottest. The side least desirable for a conservatory is the north, though even with this aspect there is no reason why a plant house should not be added for the hardier kinds of shrubs and plants. Many plans suggest themselves. A porch at the side of a house may have a small conservatory or show house attached to the side of it, and this same conservatory may form a promenade or lobby between the porch and a reception room to which it is attached. For example, the front room of

a street house may have much of the noise and dust of the thoroughfare excluded from it by a conservatory attached to the front, one end of which could open into or connect with the front porch. The view of the plants could be enjoyed equally by those entering the porch or vestibule as by persons sitting in the room. Plan 9 (see page 196 in our last issue) affords an example of a conservatory behind the staircase, and that can be made attractive in the hall. Plan 11, which we now give, shows the conservatory, or flower room, made to serve the drawing-room as well as the hall. Two arches screen off the hall on one side from the conservatory—the hall, in fact, is mainly lighted through the conservatory roof. One side of it adjoins the drawing-room, which has a French window or glazed screen in the wall, through which a charming glimpse into the conservatory can be obtained. Thus the refreshing beauty of the plants and flowers makes an attraction to both apartments. The hall arcade may be filled with a glazed screen. In the winter season the heating arrangements of the con-

Plan 11.

Plan 12

servatory would serve to warm the hall, and the warmth of the latter would conversely be of service in the summer evenings, thus an equalisation of temperature can be maintained. In town houses it is often possible to provide a recess or alcove to the hall that can be lighted above, which can be filled with potted plants, or a light area can be often appropriated by having a glass roof to be used as a show-room. The hall-conservatory arrangement has become a very general feature in the residences of the wealthy of late years, and its development offers a problem for architectural skill.

In our next plan (12) we show an arrangement of hall and staircase in which compactness and concentration have been the chief aims. The hall is screened by a vestibule and inner door from the entrance, and is lighted on one side through a painted glass window, the stairs ascending in a recess out of sight of mere callers. The doors of drawing and dining-rooms are symmetrically arranged on each side of a fireplace, which can be made to look cheerful and inviting in winter weather, and can be occupied by a jardinière or plant-house in summer. A square floor results from this plan, which can be laid with parquetry or tile; the fireplace, if of the hooded kind, can be made an ornament

feature, and be fitted with a movable stove or dog-grate. Spaciousness is realised when once the visitor enters the hall and sees the whole extent of hall and staircase combined. The interior vestibule is also extended as far into the house as is necessary to give a door into a library or reception room.

The third arrangement of halls we have to consider are halls in the centre. This plan is adopted chiefly in large public buildings and mansions. The lighting is the chief difficulty. Unless a skylight or lantern is used to throw the light from the sky directly downwards into the hall, areas must be reserved for lighting. Halls lighted from the top or by lanterns admit of considerable architectural effect. A few of these we shall illustrate by plans. Thus, the hall may contain the staircase on the open-newel principle, the flights ascending or winding round the walls; or there may be a centre first flight with wing flights on each side. Three sides of a rectangular hall may be occupied by flights, and the fourth side have a landing. The cortile is a handsome development of a central hall, the stairs occupying a recess or an inner hall. An example of this arrangement is to be seen at the Reform Clubhouse, Pall Mall, and other buildings. In the Reformagrand hall, 56ft. by 50ft., surrounded by colonnades of the Ionic and the Corinthian orders, represents an Italian cortile; the upper landing is a picture gallery approached by a staircase. The light is admitted through a ceiling or domical lantern of diaphanous glass. At the corner of Charles-street and Regent-street, the Junior United Service Club has a good arrangement of hall and staircase, the latter lighted by a handsome lantern filled with painted glass. The Conservative Clubhouse, St. James's-street, designed by the late Sydney Smirke and Geo. Basevi, has a fine coved hall, with gallery round it, and a domical vestibule above. All of these and other clubhouses afford sumptuous examples of interior hall planning, in which the architect's skill has been prominently exercised. In no other portion of the interior has more ingenuity and taste been called into play. The architect has here endeavoured to impress the visitor with the resources of his art, and to produce a *coup de maître* to which all the other apartments contribute.

#### LAND SURVEYING.—VI.

TRIANGLES.—THE CONSTRUCTION AND USE OF THE THEODOLITE.

AS a general knowledge of trigonometry is necessary for the surveyor, it may be of service if we consider a few of the rules that are used in measuring triangles portions only of which are known. We have spoken of tables of natural sines, cosines, &c. The use of such a table is that when the number of degrees in a given angle is known, the value of the sine, cosine, tangent, and other ratios can be found. Or the logarithms of these ratios can be found in any logarithmic table. When the degrees in the angle are unknown, we can find it by a simple proportion, as we have already hinted in the last article. Let us make this clear. Fig. 12 is a right-angled triangle with sides  $a, b, c$ , opposite the respective angles  $A, B, C$ , drawn to scale. Let us take  $B$  as the angle required. Then we can say as  $c$  is to  $b$  so is  $1.0$  to sine  $B$ ; or as  $c$  is to  $a$  so is  $1.0$  to cosine  $B$ , or as  $a$  is to  $b$  so is  $1.0$  to tan.  $B$ . These proportions can be simply expressed thus—

$$\begin{aligned} c : b :: 1.0 : \sin. B &= \frac{b}{c} \\ c : a :: 1.0 : \cos. B &= \frac{a}{c} \\ a : b :: 1.0 : \tan. B &= \frac{b}{a} \end{aligned}$$

Or, when the perpendicular is divided by the hypotenuse the quotient equals the sine; when the base is divided by hypotenuse the

quotient equals the cosine; or when the perpendicular is divided by the base the quotient equals tangent; these divisions being expressed by the fractions given above. The other parts of the triangle are similarly obtained. Thus the base divided by the perpendicular equals the cotangent; the hypotenuse divided by the base equals the secant and the hypotenuse divided by the perpendicular equals the cosecant. Let us show the application of this proportion. Two sides of a triangle  $a$  and  $b$  are measured with the right angle  $C$  between them. It is necessary to obtain the acute angles  $A$  and  $B$ . Of course, we can lay down the sides of the triangle by scale and draw side  $c$ , and take the angles by the protractor; but if accuracy is necessary the trigonometrical rule is the proper method of proceeding. Let us suppose the side  $b$  measures 6 chains and the side  $a$  8 chains. By referring to the proportion above given we find that, having the base and perpendicular of a triangle, the tangent of either angle can be obtained. Thus:

$$\tan. B = \frac{b}{a} = \frac{6}{8} = 0.75,$$

and, looking at the table of natural sines and tangents, we find that tangent  $0.75$  represents an angle of about  $36^\circ 52' 12''$ . Then the right angle  $C = 90^\circ$ , the angle  $B = 36^\circ 52' 12''$ . If we deduct the latter from  $90^\circ$ , the remainder is  $53^\circ 7' 48''$ , which is the measure of the other acute angle  $A$ .

It is often required to find the perpendicular of a right-angle triangle, as when the height of an object is required, and we can only measure a distance on level ground for the base and take the angle subtended to the top of the object. Let  $b$  be the height of a tower, and  $BC$  or  $a$  the distance measured. Take the angle  $B$ ; then  $b = a \tan. B$ —an equation which means that the base is multiplied into the tangent of the angle  $B$ . If we say the base measures 3 chains and the angle measures  $31^\circ$ , the tangent of  $31^\circ$  is found to be  $.600$ , and  $300 \times .600 = 180$  links for the height, which can be brought into feet.

In surveying, however, we have more to do with oblique-angled triangles. If at the apex of any triangle a perpendicular is drawn to divide it into two right-angled triangles, the lines and angles may be treated by the same rules. As we have already pointed out, a more simple mode of dealing with this class of triangles is derived from the theorem that the sines are in proportion, as the sides opposite to them or which subtend them. Thus, in the oblique-angled triangle (Fig. 13),

$$\sin. B : \sin. A :: b : a; \text{ or}$$

$$a = b \frac{\sin. A}{\sin. B},$$

and so on for the other sides.

Referring to the cases of triangles in our last article, let us take a triangle in which a side and two angles are given. Let  $BC$  be a measured base line, and  $A$  an object, the position of which we require to know; angles are taken at  $B$  and at  $A$ . Since the three angles of a triangle are equal to two right angles or  $180^\circ$ , we have simply to deduct their sum from  $180^\circ$ . Therefore,  $C = 180^\circ - B + A$ . The given base line measures 40 chains; what are the lengths of  $b$  and  $c$ ?

By the equation—

$$b = \frac{a \sin. B}{\sin. A}$$

To find angle  $C$ . Let  $A$  equal  $18^\circ$ ,  $B$  equal  $42^\circ$ , then  $18 + 42 = 60$ , and  $180^\circ - 60 = 120^\circ$ , the angle  $C$ . The natural sine of angle  $A = 18^\circ = .309$ , and the natural sine of angle  $B = 42^\circ = .669$ . Then—

$$\frac{43 \times .669}{.309} = 93.110$$

or the side  $b = 93$  chains. For the other side we have the equation—

$$c = \frac{a \sin. C}{\sin. A}$$

or the base measures  $120\frac{1}{2}$  chains, if worked

out in the same manner, and to only three places of decimals. Suppose the angles at the end of measured line  $a$  be taken, the lengths of the lines  $b$  and  $c$  can be found, and the position of  $A$  determined in a similar manner.

In diagram 9 we give another useful example of theodolite surveying. Let us suppose  $a, b, c$ , and  $d$  are the positions of the piers of a bridge across a river, and it is required to take their distances apart. From  $A$  on the bank of river erect a perpendicular  $AC$  five or six chains long. Set up flags or mark the centres of each pier of the bridge. From  $C$  measure the several angles  $ACa$ ,  $ACb$ ,  $ACc$ , and  $ACd$ , &c. Now  $CAB$  is a right-angled triangle, and the several lengths  $ACa$ ,  $ACb$ ,  $ACc$ , &c., are tangents to the angle  $C$ , and can be accurately determined by taking the angles at  $C$ , and referring to a table of natural tangents. Say the first angle to  $a$  measures  $35^\circ$ . The natural tangent is .70021. Multiplying this number by the base or radius (call it 400ft.), the product is 270ft., which gives the distance  $ACa$ . The next angle to point  $b$  is  $52^\circ = 1.2799 \times 400 = 511.96$ ft. To point  $c$  the

PLAN 9

angle is  $80^\circ = 2268.48$ ft., and so on for the other piers. Thus, the length of the several piers may be accurately calculated. The valuable rule expressed by the simple formula  $AC \tan C$  can be employed to set piers, to measure the distances between several streams which cannot be crossed by a chain, or the distance of any object on a plain line to which a perpendicular can be erected, as well as to obtain the height of a tower by the measured base line and angle already referred to. Small fractions or minutes of a degree may be neglected, as they often give trouble.

#### THE THEODOLITE, AND METHOD OF USING IT.

The construction of this invaluable instrument is familiar to most of our readers, and descriptions of it may be found in most treatises on surveying, it is unnecessary here to enter into any particulars of its adjustments and use. The best knowledge of an instrument is that derived from practice, and a person or two in the field will be of more service to the student than the perusal of any amount of instructions, which only serve to bewilder. The most important point which the student ought to direct his attention to is the construction and division of the two circular plates, the lower limb, and the upper plate, which turns freely upon it, and the vernier plate. In taking horizontal angles these two parts are constantly brought into use, while the whole limb can be turned through any horizontal angle, the

upper vernier plate only may be moved through any desired angle. The lower limb or plate is generally graduated to 30 minutes of a degree. By means of the vernier the graduation can be read to single minutes. A 6 in. theodolite has generally two verniers  $180^\circ$  apart. In a limb divided at every 30 minutes, 29 of these parts are made equal to 30 divisions of the verniers, by which we can read off  $\frac{30'}{30}$  or  $1'$ . For the benefit of the

beginner we may explain here the construction of this useful contrivance for estimating subdivisions on the lower limb, as the vernier is attached also to sextants and other instruments.

Let us suppose the limb divided into degrees, and each degree into four parts, each of these subdivisions will denote 15 minutes, or a fourth of a degree. The divisions and subdivisions of the vernier indicate single minutes and seconds, and are numbered from right to left; the extreme right one is zero or a V. The space between the lines denoting a minute is also divided into four, and each of the dividing lines will register 15 seconds. The result of these graduations on the limb and the vernier is that the limb is divided into 15 minutes, and the vernier into 15 seconds. If the zero of the vernier coincide with a division, say, 25, then the reading is  $25^\circ$ , and the same with any of the long divisions of the scales; but if the zero is between, say,  $25^\circ$  and  $26^\circ$ , the reading will denote some minutes or other fraction of a degree. Generally, however, the zero points to no marked division of the graduated limb, but to somewhere between. We then look for the degrees and minutes indicated by the divisions that are passed, and also for a line on the vernier that coincides with one on the limb. Then the number of minutes and seconds from that line to the zero added to the number read off from the limb gives the required angle. By this mode of subdivision an angle can be read to seconds with great accuracy.

Let us suppose the limb is divided into 15 minutes, and these are subdivided by the vernier to 15 seconds. The zero points to a fraction beyond the third small subdivision of the limb after  $25^\circ$ , which roughly shows that  $25^\circ$  and something more than  $45'$  is registered. Looking for a line in the vernier which exactly coincides with one on the limb, we find that from the zero  $1\frac{1}{2}$  minutes is registered, which, added to the  $25^\circ 45'$ , makes  $25^\circ 46' 30''$ , the angle required. As above stated, in small theodolites the degrees are usually divided into two equal parts, denoting 30 minutes, and the vernier divisions show minutes, so that any seconds would have to be estimated by the eye. After some practice, this, however, can be done with tolerable accuracy. For great accuracy the vernier is read by a microscope attached to the limb. It is needless to say that before an angle can be taken the theodolite must be in perfect adjustment. It must be firmly planted on the ground, and plumbed over the station or point from which the angle is to be taken; the parallel plates at the bottom of the instrument must be levelled as nearly by the eye as possible, then by two of the staff screws, turning first one and then the other, till the bubble is in the middle of its run, then turning the instrument half-round and repeating the operation with the two other screws. The other adjustments having been made, the instrument is in readiness for taking an angle.

#### STRAINS.—IV.\*

By G. A. T. MIDDLETON.

FLANGE STRAINS (continued).

IN flanged beams the strains are caused by the reactions of the supports, and not by the load itself, the greatest strains being under the

load. When a beam has to carry a fixed central load, the bent lever causing the maximum strain

Fig. 21.

in the top flange is as shown in Fig. 21,  $f$  being the fulcrum, and the equation of moments—

$$S \times d = \frac{W}{2} \times \frac{l}{2},$$

or

$$S = \frac{Wl}{4d}.$$

If the load be not centrally placed, the strain beneath it is found in precisely the same manner, the reaction at either support being taken to produce the bending moment: whichever be taken, the strain discovered to exist in the flange under the load will be the same. An

Fig. 22.

example is given in Fig. 22, where the bending moment may be taken to be either  $R^1 \times x$  or  $R^2 \times y$ —in either case, 6 foot-tons. In other words—

$$\begin{aligned} S \times d &= R^1 \times x, \text{ or } R^2 \times y \\ \therefore S &= \frac{R^1 \times x}{d}, \text{ or } \frac{R^2 \times y}{d} \\ &= \frac{2 \times 3}{1}, \text{ or } \frac{1 \times 6}{1} \\ &= 6, \text{ or } 6. \end{aligned}$$

The strains at intermediate points are found as shown in Fig. 23— $R^1$ , the reaction at the abutment A, causing the strains at all points between that abutment and the point of application of  $W$ , and  $R^2$  causing the strains at all points between the abutment B and the point

Fig. 23.

of application of  $W$ . In Fig. 23 it is assumed that the flange strains are required at a point at which

$$\begin{aligned} S \times d &= R^1 \times x \\ \text{or—} \\ S &= \frac{R^1 \times x}{d}. \end{aligned}$$

This value of  $s$  is evidently greatest when  $x$  is greatest—that is, when  $s$  is required under the load—and least when  $x$  is least, viz., at the abutment, when  $x$  is nil and  $s$  consequently is nil also. The strain varies uniformly according to the value of  $x$ .

The value of the strains under a fixed load, whether it be central or otherwise, can be

ascertained graphically as shown in Fig. 24, in which the same letters have been used as in Figs. 16 and 19. From the bottom flange under the load  $tq$  is set up equal to  $R^1$  to any scale of weights,  $p$  and  $r$  are joined by a straight line, and through  $t$  a line  $tu$  is drawn parallel

to  $pr$ .  $S$  is now denoted by  $qu$  to the same scale as that to which  $tq$  was set up. This depends upon similar reasoning to that adopted before, for  $pqr$  and  $tqu$  being similar triangles,

$$\begin{aligned} \text{or, } qu : qr :: tq : pq \\ \therefore qu = \frac{tq \times qr}{pq} \\ = \frac{R^1 \times x}{d} \end{aligned}$$

and therefore  $qu = S$ . This agrees with the result arrived at above when considering Fig. 22

To determine the strains at intermediate points set up  $qm$  vertically from the bottom

flange under the load equal to  $qu$  or  $S$ . (See Fig. 25).

Join  $mr$  and  $mn$ , then ordinates set up from the bottom flange to  $mr$  and  $mn$  will give the strains at any intermediate points.

It is easiest to ascertain the strains in a flanged beam due to a distributed load by making an assumption. Two or three different assumptions will lead to the desired result; but perhaps the easiest to comprehend is that shown in Fig. 26. The proportion of the load

on the half-beam nearest to the abutment A, instead of reacting at A, is assumed to act at its centre of gravity.

By this means the lever causing strain at the centre becomes as shown, and—

$$\begin{aligned} S \times d = \frac{W}{2} \times \frac{l}{4} \\ \text{or, } S = \frac{Wl}{8d} \end{aligned}$$

The same result can be arrived at directly, without assumption, by supposing each half of the load ( $\frac{W}{2}$ ) to act at its centre of gravity as a fixed load. Then the reaction at the

further abutment due to this half-load is  $\frac{W}{8}$  (see Fig. 27), causing strain at the centre with a leverage of  $\frac{l}{2}$ —this strain being half the strain which would be produced were the

girder loaded throughout its whole length, or  $\frac{S}{2}$ , as a similar strain would be produced by the load lying on the other half of the girder. Thus—

$$\begin{aligned} \frac{S}{2} \times d = \frac{W}{8} \times \frac{l}{2} \\ \text{or— } \frac{S}{2} = \frac{Wl}{16d} \\ \text{or— } S = \frac{Wl}{8d} \end{aligned}$$

the same result as before ascertained.

The strains at intermediate points can be similarly ascertained by assuming the portion of the load on either side of the point at which the strain is desired to be a fixed load acting at its centre of gravity, ascertaining the strains produced by each of these loads at the required point, and summing them.

The strain is greatest at the centre, and is nil at the supports, but varies between these points in a compound ratio, which is sufficiently indicated in the last paragraph.

These strains can be ascertained graphically, as shown in Fig. 28, in which the

same letters have been used as in the previous examples (Figs. 16, 19, and 24)  $tq$  being set up over the centre equal to  $\frac{W}{2}$  to a scale of weights, and  $qr$  being taken equal to  $\frac{l}{4}$ . Then  $qu$  is equal to the strain in the centre. The reasoning is exactly similar to that adopted before, for  $pqr$  and  $tqu$  being similar triangles.

$$\begin{aligned} \text{Or— } qu : qr :: tq : pq \\ \therefore qu = \frac{tq \times qr}{pq} = \frac{\frac{W}{2} \times \frac{l}{4}}{d} = \frac{Wl}{8d} = S. \end{aligned}$$

The intermediate strains are more readily ascertained geometrically than arithmetically (see Fig. 29). Set up  $qm$  vertically over the centre of the bottom flange equal to  $qu$  or  $S$  as previously ascertained, and describe the parabola as shown (in the same manner as explained to Fig. 20). Ordinates drawn from the bottom flange to the outline of this parabola will give the strains at any intermediate points.

When a load is distributed over only a part of a girder, the remainder being unloaded, it is usual to assume the load to be a fixed load acting at its centre of gravity. This can be done without great error when the load covers only a small portion of the length of the girder, while such error as occurs is on the side of safety; but when the load and the proportion of the girder which it covers are considerable, it is wisest to ascertain the strains at all points

correctly according to the method explained with Fig. 27, and as shown, perhaps more clearly, in Fig. 30, by taking several points,  $x$ , assuming the load lying on each side of  $x$  to act at its centre of gravity, ascertain

the strains at  $x$  due to each of these parts, the load, and summing them. By doing this at several points a strain outline can be set up which will delineate the strains at all points as is done in Figs. 25 and 29. It will be noticed however, that the curved outline will not extend over that portion of the beam which loaded; over the unloaded portion the outline

will be exactly the same as it would have been had the load been a fixed load acting at centre of gravity. The error of assuming  $t$  load to be fixed is thus seen to be slight, and only to affect the portion of the beam which loaded, while its rectification is only of importance as saving the employment of unnecessary material in the flanges under the load.

(To be continued.)

## PRACTICAL ARCHITECTURE WITH DETAILED ESTIMATES.—VIII.

By HENRY LOVEGROVE, F.S.I., Surveyor

JOINER (CONTINUED).

STAIRCASE LEADING INTO GARDEN.

THE following work to be framed together in white lead, and pinned with pins:—

ft.	in.	ft.	in.	
20	6			6in. x 4in. fir, wrought, framed, chamfered, 2 1/2 in. wide sill.
6	1			Notchings in do. for posts, 4 1/2 in.
6	9	8	0	4 1/2 in. by 4 1/2 in. wrought all round and framed posts.
6	1			Ornamental terminations to do. by 4 1/2 in. posts.
6	1			Oak balls 4 1/2 in. diam. fixed on posts.
2	4	9	15	3in. deal, wrought framed cross tongued in arched bays.
2	2	9	8	Add do.
3	6			4 1/2 in. by 4 1/2 in. wrought all round and framed posts.
2	4	8	9	Labour circular cutting on deal sides.
2	2	9	5	Add do. front.
2	5	3	18	Fir wrought all round, and fir bearers.
2	1			Ends built into wall and made good.
9	0			10 Fir wall plate.
9	0			Labour planing on fir.
9	6	85	6	4 1/2 in. by 1 1/2 in. yellow deal laid form lattice floor, wrought round and nailed with used iron nails.

ft. in.	ft. in.	
9 2 1	18	Wrought ends to do.
9 6		8 by 1½ do. do.
2 1		Wrought ends to 8in. x 1½in.
6 1		Notchings in 1½in. for 4½in. x 4½in. posts.
14 4		4 x 2½ oak wrought all round, sunk and chamfered both edges 1½in. girt.
8 1		Ends framed into fir posts
14 4		4 by 3 oak wrought and moulded handrail.
8 1		Ends framed into fir posts.
30 0 2 8	80 0	2in. deal square balusters, framed both ends to oak.
30 1		Ornamental turnings and cuttings to same 2ft. long.
2 5 6	11 0	4½in. x 4½in. deal, wrought all round newel as before.
2 1		Ornamental terminations to do.
2 1 0		Oak balls as before, 4½in. dia.
2 1 0	2 0	Concrete as foundations to post.
2 1 0		Dig and cart, part fill, and ram.
2 16 3	32 6	10in. by 2in. deal wrought all round string.

2 1		Labour to rounded nosing on 1½in. deal.
2 2 1		3in. lengths of do.
2 1		8in. lengths of do. cross-grain.
4 1		Mitres to do.

## STAIRCASE LEADING TO GARDEN.

The following works to be framed together in white lead and pinned with oak pins.

Dig and cart, part fill, and ram.  
6 Concrete.  
2 0 Ends timbers built into wall and facings made good.

Cube. Fir wrought all round and framed.  
6 Fir wall plate.  
10in. Sup. planing on fir.

2 3  
n. deal wrought framed and cross-tongued in arched boards.

10  
1  
un labour to rounded nosing on 1½in. deal.  
1 3in. lengths of do.

4 8in. do. cross-grained.  
2 Mitres to do.

in labour circular cutting on 3in. deal.  
3 2in. deal square balusters framed both ends to oak

80 0  
Ornamental turnings and cuttings to do. 2ft. long.  
4½in. by 1½in. yellow deal laths to form lattice floor wrought all round and nailed with galvanised iron nails.

85 6 Wrought ends to do.  
18 8in. by 1½in. do.

9 6 Wrought ends.  
2  
n. by 4in. fir wrought framed and chamfered 2½in. wide

11.  
6 Notchings in do. for posts 4½in. by 4½in.  
6 4½in. by 4½in. wrought all round and framed post.

58 0  
11 0  
Ornamental terminations to do.

6 10in. by 2in. deal wrought all round string.  
2 32 6 Ends housed to fir posts.

4 2in. balusters as before, one end framed to deal string, the other to oak handrail.

168 0  
n. deal treads 10in. wide wrought all round and rounded on front edge.

6 Notchings in 1½in. for 4½in. by 4½in. posts.  
6 Ends treads with rounded nosings housed to strings.

24 Notchings in 1½in. treads to newels.

2  
OAK  
n. by 2½in. wrought all round sunk and chamfered both

14 4  
4  
4 Ends framed into fir posts.  
8 4in. by 3in. wrought and framed and moulded handrail.

14 4 Ends framed into fir posts.  
32 6 8 Do. raking.

4  
n. 4½in. diameter fixed on fir posts.

## STAIRCASE LEADING INTO GARDEN.

The following work to be framed together in white lead and pinned with oak pins:—

Yds. ft. in. Cube. Dig and cart, part fill, and ram

1 11  
Concrete.  
No. 2. Ends timbers built into wall and facings made good to do.

1 Cube. Fir wall plate  
1 6 " Fir wrought all round and framed.

2 3 Sup. Labour planing on fir.  
28 " 3in. deal wrought, framed, and cross-tongued in arched boards.

18 Run. Labour circular cutting on 3in. deal

8 " Labour rounded nosing on 1½in. deal

No. 4. 3in. lengths of do. ....  
2, 8in. do. across grain ....  
4 mitres to do.

86 " 4½in. by 1½in. yellow deal laths to form lattice floor, wrought all round and nailed with galvanised iron nails

No. 18, wrought ends to do. ....  
8 x 1½ do. ....

60 " 1½in. deal treads 10in. wide all round and rounded on front edge

53 " 10in. by 2in. deal wrought all round string

No. 4 ends do. housed to fir posts  
80 " 2in. deal square balusters framed both ends to oak

168 " Do. one end framed to deal string and the other to oak handrail

No. 86 ornamental turnings and cuttings to do. 2ft. long

21 " 6 by 4 fir wrought framed and chamfered sill.

No. 6 notchings in do. for posts 4½in. by 4½in.

69 " 4½ by 4½ fir wrought all round and framed posts

No. 8 ornamental terminations to do.

No. 2 notchings in 1½in. treads to newels

No. 6 do. in 1½in. for 4½in. by 4½in. posts

No. 34 ends of treads with rounded nosings housed to strings

14 " 14in. by 2½in. oak wrought all round sunk and chamfered, both edges 1½in. girt.

No. 8 ends framed into fir posts.  
47 " 4in. by 3in. oak wrought framed and moulded handrail

No. 8 oak balls 4½in. diameter, fixed on fir posts.

Carried to summary ...

## CONSERVATORY.

The woodwork to be put together in white lead and pinned with oak pins:—

ft. in. 2 7 Red Corshill stone in sills and set in cement.

16 0  
8 0 24 0 4in. C. iron eaves gutter, jointed in red lead, and screwed to wood-work.

2 1 2 Stopped ends (extra to).

WAYSIDE NOTES.

**E**LY CHAPEL, in Holborn, is one of the most interesting relics of the Middle Ages of which London can boast, and the little under-croft is certainly about the strangest place of worship in the metropolis. Attention has been directed towards this old building in the columns of the *St. James's Gazette*. On the 24th inst. an article on the chapel was published, and on the 27th a letter appeared from Mr. Alexander Wood, M.A., the author of the paper on "St. Etheldreda and her Churches in Ely and London," read in the chapel itself shortly before the acquisition of the building by the Fathers of the Order of Charity. Mr. Wood regrets, as we most of us do, the substitution of stone pillars in the crypt for the quaint old timber supports, which substitution, he says, has fostered the idea that the under-croft was originally intended as a chapel, whereas it was a place of sepulture, like the under-croft of Inigo Jones's chapel at Lincoln's-inn. In the old days, I take it, when the dark, massive oaken supports loomed in the uncertain light of this curious crypt, there was little danger of one's mistaking its original destination.

From the bustle of Holborn to the crypt of St. Etheldreda's Chapel is only a very few steps, but the contrast is so great that it at all times affords one pleasure to go out of one's way for five minutes to visit the chapel. Many such visits have I paid, since the bygone days when my good master first conducted me to the building. Strangely enough, one finds many architects who have never seen St. Etheldreda's, Holborn, and, incredible as it may seem, not a few who have been daily in town for years past have never entered the edifice, although it is in the possession of that church whose portals are seldom closed.

The Architectural Association's visit to Haddon Hall reminds me that Mr. Albert Hartshorne, who generally plays his music in a shrill key, has written to the *Athenaeum* complaining of some undesirable experiments that are being made on the woodwork of that interesting old building. It is said that the old oak panelling in the Long Gallery has been treated with linseed-oil, with the view, I presume, of giving it a more brilliant appearance, a glossiness, however, wholly out of keeping with antique oak joinery. This oiling after all, however, is not a very serious matter when compared with the treatment that much beautiful oakwood has, at one time or another, received in this country. It is a curious taste that leads one to bedaub old oak with paint, but there is a lot of interesting work in old houses so destroyed, or, at any rate, hidden away. I remember an old Essex country house where the whole of the oak work remained with an epidermis of white-lead for years and years, the owner evidently preferring it. Plain linseed-oil, therefore, is the least injurious substance that can be applied to old oak, and though it is difficult to see what good will come of the experiments at Haddon Hall, we may console ourselves with the reflection that little actual harm can be done.

Mr. J. T. Helby, member of the London School Board, has written to the papers, saying that he has received a large number of anonymous letters giving information of facts connected with the purchase of sites and erection of schools, which are most fully borne out by the evidence given before the Special Committee on the Works Department, obtained last October. This evidence, says Mr. Helby, has just been published, contained in over five hundred pages of matter, and he strongly urges upon those ratepayers of the metropolis who are interested in the doings of the London School Board to peruse it, as they will then understand how their money has been wasted, and how the Works Department has been conducted by past boards. In the face of statements such as these, some inquiry, I repeat, ought at once to be instituted. Another farce, such as the recent meeting of the Board, is not what is wanted; but a Commission of inquiry such as that presided over by Lord Herschell in the matter of the M.B.W. irregularities is urgently needed.

"Architectural Plagiarism" is an interesting subject. So far as my experience goes the client is more often than not the cause of plagiarism, although if the architect has any respect for himself and his profession he would lose a job rather than crib from another man's design, and produce that copy of somebody else's work which the public will often demand with a strange persistency. It is the commonest thing imaginable for a person to ask that the plans for his house shall be prepared "as much like Mr. So-and-So's as possible," or "exactly like that pretty villa at such-and-such a place." Only this summer—by which it may be necessary to explain that I refer to the season comprised in the last few months—I was asked if it would be convenient for me to take a rough sketch of a certain pretty perspective in the Royal Academy Exhibition, with a view to preparing plans for a building as much like the one exhibited as possible. Many will be able to call to mind cases where would-be builders have been much disappointed because they could not have their houses built exactly like some building that has taken their fancy. But, as I have said, although it may be difficult to convince a client of the immorality of copying another design, no architect with a sense of honour would give way to the temptation to please their client at the expense and to the annoyance of a brother professional. Moreover, it is easy to design a building that in the eyes of the public shall in effect be similar to another, although in reality totally different. As regards piracy pure and simple, I do not think that it prevails to any great extent in the architectural profession, as we know that to anyone worthy of the name of an architect it comes far easier to design new features than to adapt old ones. Only bunglers plagiarise, and their productions are so ridiculously unlike the originals they "copy," we surely need not go out of our way to abuse them. Of course, there are architects who have very queer notions about plagiarism. I know one old fogey who believes he has a special patent in gables and tile hanging, and honestly believes every builder who uses them has copied a pair of villas he once put up in a village where he and his relatives fancy every building, public and private, ought to be built from his designs.

"Flat" building on a large scale is about to be prosecuted at Chester. The Cross Gun-court, off Foregate-street, the property of the Duke of Westminster, has been demolished, and large blocks of model dwellings on the flat system are to be erected for artisans and others. It appears that each set will be very completely arranged, with its own conveniences, and "sanitated" on the most approved principles. The principle which most meets our approval is that a large space will be left free all round the buildings, instead of the whole block being continuous, with stagnant areas for many of the apartments as in London.

Are architectural partnerships a failure? I should say that they are very good things if properly arranged. The chief thing necessary to insure the happiness of partners in business seems to me to be a mutual appreciation of the laws of domination and subordination, which are of such far-reaching importance in every stage of architectural composition. Co-equality there cannot be. As one feature of a composition must be markedly dominant, so, if an architectural partnership is to be a life-long success, one of the partners must be looked up to and revered by the other or others; or, if mutual respect is the result of individual excellence in different branches—if, for instance, one respects the other because he is a true artist, while the other respects his co-partner because he is a skilled constructor and a good man of business, harmony will be the result, and all will go well. But if both pride themselves on the same peculiar accomplishment—if, let us say, both aspire to be gifted designers, the harmony will be assuredly changed into discord, and the sooner an architectural divorce takes place the better.

I do not speak from experience. But in journeying through life I have kept my eyes and ears open, and have, perhaps, had unusual opportunities for observing the working of architectural partnerships. I have observed

that the partnership of friends because they are friends is hazardous—very; that the union of incompetence and skill, of indolence and energy, and of virtue and vice, although formed with excellent prospects, is sooner or later attended with disastrous results; and I have observed that though there can be no real equality, that attribute may well appear to exist in the eyes of the world. And I have learnt that though it has been said that age cannot live with youth, this is scarcely true of an architectural partnership. The iron-grey head and unwrinkled brow work together, in our profession, with perfect harmony. Some degree of variation in character, in talents, and accomplishments, seem favourable to success. The worst partnerships are between men of the same mould of mind and character, with similar shortcomings. Much one could write on this question. I have touched only on the subject as affecting the interests of the partners. It would be interesting and instructive to hear some opinions from architects who can speak from experience, and also from those who have authority to speak on such partnerships as affecting architecture as a fine art. GOTH.

VENTILATING TUBES.

**T**HE quantity of air discharged per minute through a ventilator is variously stated, though one of the fundamental things to be known in ventilating any room. Of course the principle of the discharge is the difference in the temperature between the room and the external air—the greater the difference the more rapid the current, other things being equal; the height of ventilator is also an important condition. To take Hood's calculations, we find that, supposing the height of ventilator is 10ft.—an ordinary height of a room exit—and the difference between the interior and outer air is 5°, the cubic feet of air discharged per minute through a ventilator of 1ft. square is 116ft. At a height of 15ft. the discharge is 142c.ft.; at 20ft., 164ft.; at 30ft. it is 201ft.; at 40ft. in height it is 235ft.; and at 50ft. the discharge is 260c.ft. With a difference of 10° the discharge is for 10ft. height of ventilator 164c.ft., which is just equal to the discharge through a ventilator 20ft. high and with a 5° difference of temperature. At 15ft. the discharge is 202c.ft.; at 20ft., 232c.ft.; at 30ft., 284c.ft.; at 40ft., 329c.ft.; and at 50ft. high, 367c.ft. These figures are sufficient to show that height and temperature are both important conditions to the effectual ventilation of buildings, and that, if we cannot be sure of having our interiors warmer than the outer air—a state of things not unknown during summer weather—it is very necessary to place the outlet for vitiated air as high as it can be conveniently arranged.

CHIPS.

On Tuesday week, Archdeacon Blunt reopened the church of St. Mary at Watton, situated between Driffield and Beverley, after much-needed restoration. The high-backed pews have given place to benches, the chancel has been fitted with stalls, and the floor of the church has been entirely relaid with Staffordshire tile pavement. Messrs. G. Shepherdson and Son, of Driffield, carried out the works.

The death is announced of Mr. Robert Collins, C.E., the chief engineer of the Belfast and Northern Counties Railway Company, Ireland. He was engaged in his early manhood in the construction of the Tunbridge Wells and Hastings line, under the contractors for that section of the South-Eastern Railway, Messrs. Warton and Warden. In 1855 he obtained the appointment of Engineer to the Londonderry Port Harbour Commissioners, and held subsequently the position of Engineer to the Londonderry Coleraine Railway, and upon the acquisition of that railway by the Belfast and Northern Counties Company, in 1871, that of chief engineer of the whole of the latter company's system.

At a special meeting of the Preston town council, held on Friday, it was decided to pay Mr. T. W. Walker, the contractor for the suspended Ribble Navigation Works, the sum of £34,572 19s. 6d., being the retention moneys in the hands of the corporation.

A new Masonic hall was opened on Saturday at Derrigahy, Milltown, co. Antrim. It has been built by Messrs. D. and P. M. Henry, of Belfast.

## OUR LITHOGRAPHIC ILLUSTRATIONS.

## ST. MARK'S, VENICE.

THIS world-famed masterpiece of Byzantine architectural skill is too familiar to need any lengthy description here by way of introduction to the photographic illustration which we give to-day. The view shows the north side of the nave and transept, with its isolated dome, one of the five golden domes which crown the cathedral. Who the architects were who designed St. Mark's is unrecorded, and, indeed, it remains a vexed question whether they were Greeks or Italians; but the architectural detail of the fabric undoubtedly indicates an Eastern or Arabic influence, while the Lombardic character of some of its later decorations is indisputable. The columns which enrich the building number no less than five hundred, some being in the finest African and Greek marbles, porphyry, and verde antique brought from older buildings, and everywhere the round arch predominates. The walls, both inside as well as out, are encrusted, too, with marbles and mosaics, with the floors of marble and porphyry tessellation, varying in scale from the most vast slabs to the finest mosaic work, glowing in Oriental colours and magnificently enriched with sculptures, every foot of this wonderful church being, in fact, a precious work of art. Signor Ferdinando Ongania, of Venice, lately published a series of portfolios containing details in chromo-lithography and photogravure of "La Basilica di San Marco in Venezia," and some of these grand illustrations of the cathedral are now being exhibited in the Italian Exhibition at West Kensington. Nearly every style of art is represented either in the architecture or the decorations of this building, which, although at first only the court chapel of the Doge, soon exercised an extensive influence on the national taste and styles. The Patriarchate was in 1807 removed from San Pietro to St. Mark's, which was thus constituted the cathedral of the city, and the Venetian Government has annually appropriated a certain sum to its restoration and maintenance. The origin of St. Mark's is doubtful, but in 552 a chapel to St. Theodore had already been erected on the site by Narses, the Greek captain. In the 9th century more reliable data tells us that the body of St. Mark was brought by Venetian citizens from Alexandria, when the jubilant people deposited their former patron saint, and his chapel, just referred to, was incorporated in the new church of St. Mark. Doge Giustiniano Partecipazio began this greatly developed work, and his brother, Giovanni, finished it. The building was, however, destroyed by fire in 977, and the saint Doge Pietro Orseolo commenced to rebuild the church on a much grander scale on the model of the church of the Apostles at Constantinople, and furnished the funds out of his own treasury. The work was continued by his successors, among whom Domenico Con-

tarini should be mentioned for his zeal in this respect (1043), but nearly a hundred years had elapsed before the fabric was completed (1071) under Domenico Salvo. This Doge decorated it with the costliest marbles, and during his reign the mosaics were commenced. In 1094, under Vitale Faliero, the cathedral was solemnly dedicated. The consecration took place on Oct. 4, 1111, in the time of Ordelafo Faliero. The Byzantine leafage of the capitals of the columns in St. Mark's are nearly identical with many at Constantinople, and it is interesting to note that the church of St. Froude at Perigueux in the centre of France was at about the same date erected by Venetian merchants in direct imitation of St. Mark's at Venice, thus commencing probably the class of forms classified by Violett le Duc as the "Gallo-Romaine," in order to distinguish them from the Romanesque works found side by side with them. St. Mark's, indeed, furnishes the link between the Byzantine style and the churches of Aquitaine, and through them to our own Romanesque and Transitional works. Similar semi-classical details, contemporary with St. Mark's, are to be seen in one of the portals of the cathedral at Mayence, having columns crowned with Corinthian capitals and thick impost mouldings. Very similar, too, is the architecture of the church of the Holy Theotokos (or Mother of God) at Constantinople, which differs, perhaps, very little, too, in point of date, from St. Mark's at Venice. That church, however, has but one dome of any importance, though there are several minor ones over the narthex. The principal dome covers the intersection of the barrel vaulting at the crossing, and is supported by four columns. St. Mark's, on plan, is that of a Greek cross, consisting of a group of five squares, each of which is covered by a pendentive dome. Its peculiarity lies in the breadth of the strips of wagon vault which support and separate these domes, which is so great that the vast piers which sustain them are pierced in two stories, and divide each other into four piers, with a vaulted space between them. Each dome is, consequently, the centre of a cruciform space, the wings of which have wagon vaults. The only exception is the east end, where the apse is substituted for this space, and out of this apse, as at St. Sophia, spring three minor ones with columns between. Each dome is about hemispherical above its pendentives, and is pierced with lights like those at St. Sophia. Lofty timber domical towers rise over the exterior of these domes, and terminate in a sort of Oriental turret at the apex. In Sir Gilbert Scott's lectures on Mediaeval Architecture, delivered before the Royal Academy (Vol. II, p. 265), a plan and section of the cathedral is given from Ferguson, with a cross-section of one of the domes in detail. The wings which flanked each domed space, bounded as they were by the perforated piers, were so suggestive of side aisles that the builders, familiar, no doubt, with aisled churches, added arcades from pier to pier, both in the nave and in the transepts. These, however, are merely decorative, supporting no galleries, as is frequent in the East, and only serving as narrow communications, equivalent to triforium passages, between the upper chambers in the great piers. The decoration of the interior is no doubt a joint imitation of St. Sophia's and the Apostles' Church, as already mentioned, imitating the latter in its plan and rivaling the former in its sumptuous elaboration. The church suffers internally from a want of light, and in spite of the brilliant rays of a southern sun, the church always is seen in a sort of gloom. Sir Gilbert Scott's plan of the cathedral was given in the BUILDING NEWS for April 4, 1873; and a perspective view of the west façade in our issue of Dec. 19, 1879.

## BIRMINGHAM NEW POST-OFFICE.

We gave elevations, sections, and plans of this building in our issue of June 8 last, and now supplement them with details. The building, which has been recently commenced, is from the designs of Mr. Henry Tanner, of H.M. Office of Works, and the builder is Mr. Vickers, of Nottingham.

## MEMORIAL CHAPEL TO THE LATE ARCHBISHOP VAUGHAN.

THIS chapel is to be built in memory of the late Archbishop Vaughan, and will form the

north transept to the Pro-Cathedral, St. Michael's Priory, Belmont, near Hereford. At the west side will be placed the tomb, and on the east side an altar will be erected to St. Bede, who was the patron saint of the late archbishop. Messrs. Pugin and Pugin, of Westminster, are the architects of this and the whole group of buildings. The estimated cost is about £2,000. A ground plan and double-page perspective of the Priory and Pro-Cathedral buildings, as proposed to be completed, was published in the BUILDING NEWS for April 12, 1878; and the memorial tomb of the Right Rev. Thomas Brown, O.S.B., first Bishop of Newport and Menevia, which has been placed in a chantry chapel of the Pro-Cathedral, in our number for Nov. 7, 1884.

## PROPOSED NEW RESIDENCE AT NOTTINGHAM.

THIS house is designed for a somewhat cramped site in a pleasant part of Nottingham, and its general arrangement may be seen by a glance at the key plan. It contains hall, dining, reception, and business rooms, kitchen and kitchen offices, and six bedrooms. The materials used are Bulwell rock-faced stone and local red bricks for the walls, the wrought stonework being blue Handsworth. The external woodwork is oak. The ground floor walls are panelled in wainscot, and the reception-room contains an angle. The cost, when completed, will be about £1,900. The illustration is taken from a drawing by the architect, Mr. Arthur Marshall, A.R.I.B.A., Nottingham.

## WARDEN'S LODGE, DAVENTRY GRAMMAR SCHOOL.

THIS building, now approaching completion, is intended as an addition to the present grammar-school to accommodate the rapidly-increasing number of boarders. It is pleasantly situated on the outskirts of the town, and near the present buildings. The whole front is faced with red sand brick, the ornamental features being carved in Messrs. Lawrence's rubbers. The roof is covered with red Brosely tiles. The builders are Messrs. J. Parnell and Son, of Rugby, and the architect is Mr. Norman M. Brown, A.R.I.B.A., of Leicester.

## COMPETITIONS.

CLAPHAM PUBLIC LIBRARY.—The award in this competition of the work to Mr. E. B. T'Anson, and the second place and a honorarium of £10 (which, however, was refused) to Mr. J. J. Jones, has given rise to much angry discussion in the daily and local newspapers. One journal says "the Commissioners have employed the solicitor to the vendor of the library site as their secretary; they have accepted the design of the surveyor to the vendor of the ground as their architect, although his measurements were wrong and his price excessive, and if report be true they have engaged the builder on the same vendor's estate as the contractor for the library. Hence the Bowyer Manor Estate has furnished the Commissioners with a plot of ground, a secretary, an architect, and a contractor—all from its own office." "Keruba," writing in the *Echo*, stated that the selected plan omits a basement, affords facilities for the multiplication of extras, and further that "the Commissioners who chose the plan by the surveyor to the Bowyer estate comprise two clergymen whose livings are part of the property of the vendors (the Bowyer estate), the solicitor to the same estate, the two churchwardens to the parish church (the living of which is in the gift of the Bowyer family), and four vestrymen." In reply, "Abuker," writing in Tuesday's *Echo*, admits that the original measurement of the site as shown on the plan sent out to competitors was incorrect, but says it was "more than compensated for by the vendors conveying to the Commissioners an additional piece of ground. 'The plan chosen,' 'Abuker' adds, 'is perfectly workable, does not omit a basement, and does not afford an absolute necessity in this case, facilities for the multiplication of 'extras' later on. The solicitor to the vendors is not one of the Commissioners; and, notwithstanding the insinuations of your correspondent, the whole of the Commissioners are gentlemen and men of honesty and integrity.'

## POLISHING GRANITE.

THE form is given to the stone by the hands of skilled masons, in much the same way as is done with other stones of softer nature. Of course the time required is considerably greater in the case of granite as compared with other stones. If the surface is not to be polished, but only fine-axed, as it is called, that is done by the use of a hammer composed of a number of slips of steel of about a sixteenth of an inch thick, which are tightly bound together, the edges being placed on the same plane. With this tool the workman smooths the surface of the stone by a series of taps or blows given at a right angle to the surface operated upon. By this means the marks of the blows are given obliquely on the surface of the stone are obliterated, and a smooth face produced. Polishing is performed by rubbing in the first place with an iron tool and with sand and water. Emery is next applied, then putty with flannel. All plain surface and moulding can be done by machinery, but all carvings, or surfaces broken into small portions of various elevations, are done by the hands of the patient hand-polishers.

The operation of sawing a block of granite into slabs for panels, tables, or chimneypieces is a very slow process, the rate of progress being about half an inch per day of ten hours. The machines employed are few and simple. They are technically called lathes, waggons, and pendulums or rubbers. The lathes are employed for the polishing of columns, the waggons for flat surfaces, and the pendulums for moulding and such flat work as is not suitable for the wagon. In the lathe the column is placed and supported at each end by points, upon which it revolves. On the upper surface of the column there are laid pieces of iron, segments of the circumference of the column. The weight of these pieces of iron lying upon the column, and the constant supply by the lathe-attendant of sand and water, emery or putty, according to the state of finish to which the column has been brought, constitute the whole operation. While sand is used during the rougher state of the process, these irons are bare; but when using emery and putty, the surface of the iron next to the stone is covered with thick flannel.

The wagon is a carriage running upon rails, in which the pieces of stone to be polished are fixed, having uppermost the surface to be operated upon. Above this surface there are shafts placed perpendicularly, on the lower end of which are fixed rings of iron. These rings rest upon the stone, and when the shaft revolves they rub the surface of the stone. At the same time the wagon travels backwards and forwards upon the rails, so as to expose the whole surface of the stone to the action of the rings. The pendulum is a frame hung upon hinges from the roof of the workshop. To this frame are attached iron rods, moving in a horizontal direction. In the line upon which these rods move, and under them, the stone is firmly placed upon the floor. Pieces of iron are then loosely attached to the rods, and allowed to rest upon the surface of the stone. When the whole is set in motion, these irons are dragged backwards and forwards over the surface of the stone, and so it is polished. When polishing plain surfaces such as the needle of an obelisk, the pieces of iron are flat; but when we have to polish a moulding we make an extra pattern of its form, and the irons are cast from that pattern.—*The Stonemason.*

## CHIPS.

A new mission hall is about to be built in the Grove, Southwark. Mr. John Groom is the architect, and Messrs. W. and H. Castley, of Redcross-street, are the contractors.

Mr. J. Thornhill Harrison, Local Government Board inspector, held an inquiry at Acocp's Green, near Birmingham, on Friday, into an application made by the Solihull rural sanitary authority to borrow £2,800 for works of sewage at Yardley. The surveyor to the rural authority produced and explained the plans.

Two figures representing St. Paul and St. Wilfrid were placed on Saturday at the base of the reredos of St. Nicholas's Cathedral, Newcastle-on-Tyne, the work of Mr. J. Sherwood Westmacott. There are still ten figures to be placed in the centre of the reredos. A series of the statues were illustrated in the BUILDING NEWS for Jan. 6 of the present year, and the reredos itself in our issue of May 25 last. The interior of the choir, as restored by Mr. R. J. Johnson, F.S.A., was given in the number for Nov. 11th, 1887.

The magistrates of Longton, Staffs., granted a license for the new Queen's Theatre in that town. The new theatre, which is situated in Commercial-street and Chancery-lane, has been erected from the plans of Mr. John Taylor, architect, Longton, by Mr. T. S. Bromage, of Longton, the contract price being £12,000. Accommodation is provided for 3,000 persons.

## Building Intelligence.

BIRMINGHAM.—Three gifts to St. Philip's Church were completed on Saturday. They consist of two stained-glass windows placed in the north-east and south-east apsidal corners of the chancel, and a new font standing in the baptistery at the west end of the church. The new windows were designed by Mr. E. Burne Jones, R.A., and made by William Morris and Co. They form companion pictures to that in the east window, which is by the same artists, and the subject of which is the Ascension. The window on the north-east represents the Nativity, and that on the south-east the Crucifixion. The two new windows cost about £700 each. The new font stands on a pediment of Portland stone. Under the bowl is a richly carved pedestal of Pavonazza marble, and of square section. The capital of the pedestal is of alabaster foliated, and supports the bowl, which is a fine block of polished Mexican onyx. This massive vessel is formed out of one of the largest slabs of onyx imported into this country. The font, which has cost about £150, was designed by Mr. J. A. Chatwin, who carried out the enlargement of the chancel, and the work was executed by Mr. Robert Bridgeman, of Lichfield.

BRIXTON.—A tower and spire are being added to the fine church of St. John the Evangelist, Vassall-road, Camberwell New-road, erected fourteen years since, from the designs of the late Mr. G. E. Street, R.A. The church, which is said to have been regarded as the *chef d'œuvre* of his ecclesiastical structures, has already cost upwards of £20,000, and internally is still unfinished. The tower will be 25ft. square at the base, and the foundation walls are carried to a depth of 10ft. below the ground line. This portion of the structure will be 108ft. in height from the ground line. It is faced with red brick 2in. in thickness, specially manufactured for the occasion, with Bath stone for dressings and ornamentation, and will be uniform with the church in its features. At each angle massive buttresses, having ornamental stone capitals, are being carried up to within a few feet of the cornice. On each side of the lower portion of the tower there is a central window 28ft. high. The upper portion is intended to be fitted for a peal of eight or ten bells. The spire, entirely faced with stone, will rise to a height of 104ft. above the tower, the entire height of the structure, from the ground line to the apex of the spire, being 212ft. The bell loft will be reached by a winding staircase at the north side of the tower, in which it is proposed to place an illuminated clock with chimes. Mr. Arthur Edmund Street, M.A., is superintending the carrying out of his late father's designs, and Messrs. Dove Brothers are the contractors.

GULLANE, N.B.—A new Episcopal church in the village of Gullane, East Lothian, was opened on Sunday. It adjoins the ruins of a Norman church which has been disused since the Reformation, and is of the same character. Mr. John Honeyman, architect, Glasgow, was the designer of the new chapel. It consists of a nave and apsidal chancel—the chancel arch being a reproduction, on a slightly enlarged scale, of that in the old kirk. The chancel of the chapel is lighted by three small round-headed windows. The erection of the bell tower will be delayed until sufficient funds are available. Measuring 71ft. (including apse) by 29ft., the nave of the new church will hold 250 people, who will be accommodated with chairs instead of pews. The pulpit, which is placed in the north-east corner of the church, near the arch, is at base of white freestone, with the upper part of oak. The walls of the church inside and outside are faced with dressed freestone. The contractor for the mason work was Mr. George Blair, Belhaven, Dunbar; and for the other parts Messrs. Binnie and Scott, Edinburgh. Including the boundary wall, the whole cost will not much exceed £800.

PLYMOUTH.—In pursuance of the scheme for the reconstruction of the Plymouth Market, another block of buildings has just been completed and will very shortly be occupied. Both sides of the proposed new road through the

market connecting Tavistock-street with Cornwall-street are now flanked with blocks of new market buildings. The width of the road 40ft., with asphalted footway in front of the new block 8ft. wide. The ground plan of the entire market provides for this road as a public thoroughfare. The block just completed constructed in the same style as the other new sections. Mr. C. King is the architect, and Messrs. A. R. Lethbridge and Son, of Truro Building-yard, Plymouth, are the contractors. The cost of the work having been about £3,100. The clerk of the works was Mr. S. Stanbury. There are eleven shops in the block, the average inside measurements of each being 19ft. by 15ft. 3in. The height of the shops which occupy the ground floor is about 12ft., while the upper rooms have a similar area to the shops, but an average height of 11ft. Lime stone piers with granite bases divide the shop and support the upper part of the building. Messrs. Goad Bros., Plymouth, have supplied the piers, and Mr. Storey, of Calstock, the granite. The front of the block and the chimneys are of Fareham bricks, and the roof of Delabole slate, supplied and fixed by Mr. S. Roach, Union-street. A liberal use of terra cotta has been adopted, the material being supplied by Messrs. Monk and Newell, of Ruabon. The whole of the ironwork has been supplied by Messrs. Allan and Son, of Glasgow.

RIBBLETON.—Mr. W. E. M. Tomlinson, M.P., laid last week the corner stone of a new church at Ribbleton, near Preston, to be dedicated to St. Mary Magdalene. Only the nave of the church and the lower part of the tower are at present in hand. The walls will be built of Yorkshire parpinto, and all the stone dressings will be of red Rainhill stone. The interior walls of the church will also be built of Rainhill stone up to the window sills, and the chancel and tower arches are to be of the same material. The style is of the Decorated period and the tracery of each window will be varied. Mr. R. Knill Freeman, of Bolton, is the architect, and the contractors are Messrs. George Wood and Son, of Bootle.

STOCKLAND.—The parish church of St. Michael, Stockland, Devon, was reopened on Tuesday week, after restoration. The church has been entirely resseated with the exception of the chancel, the north chancel aisle, and the west gallery in the tower. New floors under the seats have been put throughout, formed of solid wood blocks laid herring-bone wise on a bed of concrete, with a thin layer of Portland cement under the blocks. Moulded open benches of pitch pine, left clean from the tool, take the place of the high pews which boxed in and hid the proportions of the nave piers and bases. The bases have been repaired where formerly mutilated in the erection of the old pews. The heavy prayer-desk in the nave has given place to small desks fixed on ornamental brackets to the chancel seats on the north and south side for the officiating clergy. The central passage between the chancel seats has been widened, and the whole of the chancel laid with encaustic tile paving specially designed by the architect, and manufactured by Messrs. Godwin and Son, of Lugwardine, near Hereford. There is a new altar railing of oak supported on wrought iron standards. The altar also has been heightened and lengthened, having been of insufficient dimensions. The reredos and pulpit, being out of character, have been removed. The south transept, or "Ford Pew," has had its floor lowered to the same level as the nave. The font has been refixed in the centre of the ground story of the tower, on a Keinton stone platform, and will have an ornamental flat font cover clasped with wrought ironwork. Two underground chambers have been formed, with gratings over, for Porritt stoves. The ancient external doorway and door at the east end of the church have been opened out and restored. The south porch is being opened out and repaired, the original external arch restored, a new oak ceiling (copied from the present one, which is decayed) provided, and new doors erected. The works have been carried out under the superintendence of Mr. B. Edmund Ferrey, F.S.A., of 15, Spring-gardens, London, S.W. Mr. W. T. Berry, of High-street, Honiton, was the contractor.

UPEXE, REWE.—The ancient chapel of ease at Upexe, in the parish of Rewe, Devon, was

ned on Saturday after restoration, from by Mr. R. Medley Fulford, of Exeter; rs. George Short and Son, of Silvertown, mpton, being the contractors. The build- chiefly of Early English character, with Decorated additions and insertions, and been used as a dwelling for two families cottagers for several generations. In re- ing it for purposes of worship, it has been ight sufficient to renovate the solid parts e chapel, and only gradually incur the of furniture. The building, which was in y dilapidated condition, was constructed iltonton stone, and the new stone has been lited from a quarry at Killerton by Sir nas Acland. The copings are constructed Ham Hill stone, as well as the bell turret the cross at the eastern end. The chapel een fitted with a roof of pitch-pine in the ic style, and an outer covering of tiles a the firm of Messrs. Exley and Son, of eley. The floor has been laid with con- e, while the space outside the altar rails has e fitted with mosaic tiles, supplied by rs. Wollisroft and Son, Hanley, Staffs. windows have been filled with stained s. The expense so far incurred is about 0. A vestry will be added at once to the ding on the northern side, and this, with construction of ventilators, will increase expenditure to £400.

WALTHAMSTOW.—The Prætorian Avenueools have recently been erected for the Walthamstow School Board, from the designs under the superintendence of the architect, W. A. Longmore, of Prospect-hill, the dding works having been carried out by rs. Green and Lee, builders, of Antonet Works, Hackney. The schools accommo- 380 boys, 360 girls, and 410 infants—total, 0, the amount of the contract being £8,000, about £7 per head. The school buildings constructed in a most approved manner h solid block flooring to the rooms and ent stone paving to the corridors. The oes are finished with Keene's cement and nted. The ceilings of match-boarding, wing the ornamental principals of the roofs, all the woodwork, except the windows, ned and varnished.

WALSHAM, LANCs.—The contracts for the eral works required in the erection of the e Haworth Memorial Church, between Walsham and Lower Croft, have been let to rs. S. Hobson, of Rawtenstall, and John ith and Sons, Thomas Cornall, and John y and Sons, of Bury, and building operations e been commenced. The accommodation is nally for 550 worshippers, but the space eeen the benches is much greater than that ally allowed. The nave is 46ft. wide in- nally, and roofed in one span; arcades on h north and south sides divide the area so as provide approaches along the wall sides. At e eastern end of the nave are transepts ided by a double arcade from the nave. On e south side of the chancel is a memorial el and a clergy vestry, occupying the und floor of the tower. To the north of the ncel is situate an organ chamber over a choir y. The style adopted is Geometrical thic. The principal external feature is the ver, which, together with the octagonal spire, es to a height of 160ft. The west gable is nked by octagonal turrets, and has for a utral feature a seven-light window, 34ft. in ight. All the external stone, both for walls d dressings, is from the Holcombe quarries, d that for the interior from Cullingworth. The ifs are covered with Buttermere green slates, d are double boarded. The chancel has an aded dado of stone, and a reredos, 20ft. in ight, of stone and marble. The pillars of the ve arcades are of polished granite; the floors e passages, porches, and chancel are paved h tiles and mosaic, and the others with oden blocks laid on concrete. The walls of ve and transepts have a dado of Ruabon lcks, with bands of celadon bricks at inter- ls, and a capping of terracotta. The roof bers are of pitch pine, wrought where seen; e open benches are of the same material.

Prof. Hauser, while engaged on superintending e excavation of the Roman station at Carnatum, e Danube, near Vienna, has discovered in nfield the site of an amphitheatre, which is parently in a good state of preservation.

## ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BRITISH ARCHÆOLOGICAL ASSOCIATION AT GLASGOW.—The British Archæological Association opened their forty-fifth annual congress at Glasgow on Monday. The Lord Provost held a reception in the Corporation Hall, when Mr. John Honeyman, F.S.A., F.R.I.B.A., president of the local society, welcomed the members. The congress then visited Langside, unveiling a new stone monument commemorative of the death of Mary Queen of Scots, erected on the battlefield. They afterwards visited the cathedral, where Mr. Honeyman acted as guide, and read a paper on the architectural features of the building. On Tuesday the members visited Bothwell and Craignethan Castles, Lanark, and the Falls of the Clyde, and on their return an address was given by the President, the Marquis of Bute, in the Merchants' Hall. On Wednesday visits were paid to Torwoodhead Castle and the Tapoch Broch, which were described by Mr. J. Dalrymple Duncan, and the battlefield of Bannockburn and the antiquities of Stirling, where Mr. W. B. Cook acted as guide. At the evening meeting, papers were read by Archbishop Eyre, Professor Veitch, Dr. Collingwood Bruce, and Mr. Allan Wyon, Chief Engraver of Her Majesty's Seals.

SOMERSET ARCHÆOLOGICAL SOCIETY.—The annual meeting of this society, which is held this year at Wells, was opened in the town hall of the city on Tuesday. The Bishop of Bath and Wells (Lord Augustus Hervey) presided. The annual report stated that the membership is increasing, and is now 530, and that the financial condition of the society is also satisfactory. An address was given by the president. Afterwards the members visited the palace, which was described by Mr. Henry Buckle, and the Close Gates, an evening meeting being held in the evening. On Wednesday an excursion was made to Rodney Stoke and Cheddar, and in the evening papers were read and discussed at the town hall.

## ARCHÆOLOGICAL.

DISCOVERY OF PREHISTORIC GRAVES IN ROSS-SHIRE.—On Friday last, on Drummond farm, in the parish of Kiltarn, Ross-shire, an ancient grave was opened in the presence of Sir Hector Munro, the owner of the property. A similar grave had been opened ten days before in the same place, and in both instances the skeletons were found pretty entire. The mound in which the graves occur is a natural accumulation of gravel and sand, formed by the river Sgiach, which flows close by. There are four such mounds in the field, that in which the coffin-pits in question occur being about 20ft. high and about 40 yards long. Its length lies almost due north and south. The dimensions of these coffin-pits or cisterns are similar—3ft. 3in. by 2ft., and depth 2ft. The grave-lining in both cases is formed of large undressed red sandstone flags, and two or three flat boulders of gneiss, all found in the neighbourhood. In the southern or more primitive grave was found, besides the skeleton, an urn of coarse clay containing black ash, but nothing else. In both graves the skeletons were seen in bold relief against the bottom of the coffin-pit with their faces to the east. The knees were drawn up and the hands placed on the cheeks. The urn, with its contents, is in the possession of Sir Hector Munro, and will be preserved at Fowlis Castle.

A new organ was opened on Tuesday at a festival service in Kirkby Stephen parish church. The organ was built by Mr. J. Abbott, Leeds, and planned by Mr. Walker Joy, of Harrogate, with oak screen, designed by Mr. Norman Shaw, R.A., London.

Mr. John Brownrigg, builder and contractor, of Bowness, went on Friday to the top story of a house in course of erection and struck his head against a piece of woodwork. This caused him to fall from the gangway he was standing on to the basement, and death ensued shortly afterwards. Mr. Brownrigg was one of the oldest members of the local board.

The parish church of Horwich, near Manchester, was reopened on Friday after being decorated internally, a work carried out by Messrs. E. Goodall and Son, of Manchester.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 80c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.). To India (via Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

## NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., LI., LII., LIII., and LIV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print. Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—M. H. and Co.—J. K. and Co.—C. and Co.—T. P. C.—G. B. J.—S. Bros.

J. D. and Co. (Go to a good firm like Braby and Co., Easton-road, or The London Galvanised Iron Co., Wharf-road. Don't buy cheap rubbish.)—R. B. (Very likely; send and we will see.)—J. VINCE. (J. C. Edwards, of Ruabon, or the Burmantofts Co. Avoid the firm you mention.)—A. ROBINSON. (No good—don't trust them.)—L. (Marion's ferro-prussiate paper is what you want. See advt. on front page.)—H. HUDSON. (Not the same companies—the one in Great George-street is the one we recommend.)—TERRACOTTA. (You pay for a name of course there as well as at other places. Plenty of small people do good work, but they don't seem to think it worth while to make themselves known. Nine-tenths of the makers of building goods seem to think architects have nothing to do but walk about looking for novelties; the sensible tenth recognise the fact that it is their business to make themselves known to architects, and so make money.)

## Correspondence.

### SOCIETY OF ARCHITECTS—POSTPONE- MENT OF THE CARDIFF VISIT.

To the Editor of the BUILDING NEWS.

SIR,—The Council greatly regret that, owing to local arrangements of which they have only now received information, it has become necessary to postpone the visit to Cardiff till next year. They regret this the more as the gathering promised to be the most successful yet undertaken, but trust that there will be a large attendance when it is eventually arranged.—I am, &c., G. A. T. MIDDLETON, Secretary.

St. James's Hall, Piccadilly, London, W., August 29th.

## STRAINS.

SIR,—As Mr. Middleton, in your issue of the 17th inst., still asserts the correctness of his new version of vertical shearing stress, I will try and prove to him the fallacy of his reasoning, and at the same time explain "the theory to which Col. Seddon pins his faith."

In his reply to my letter, which appeared in

AUG. 31, 1888.

quantities. Indeed, short quantities would be the order of the day, for what advantage would be gained by accuracy when all the work was to be measured, while by keeping the quantities short the owner would be the more easily got into it." Then, indeed, there would be what a high time for surveyors as well," as of course they would get their 1 or 1½ per cent. on the "quantities" without any fear of "niggling over half-inches, squabbling over the girth of this moulding or projections of that cornice," or Scotch "probable" quantities would do as well as the most correct; so that, "in these days of close competition and cutting prices," the services of the quantity surveyor might possibly be dispensed with in the first instance, which probably Mr. Stone did not contemplate. But even so, he would, in any case, get his 1½ or 2½ per cent. for the admeasurement of all the works at the completion, when no doubt he deferred niggling and squabbling would come off with cumulative force. Still, the surveyor would then be "cock of the walk" and master of the situation, and the architect would have the honour and glory of signing his name and giving his certificate for the amount really decided by the surveyor, either "long or short," as he may be disposed to yield to or resist the "Argus eye" of the contractor. There can be no more safeguard against errors in "measuring up" work one than in "taking off" quantities from drawings; the disturbing influences are more pressing and immediate, and the difficulty of getting at facts much greater. Still, the result would probably be that smart builders, with "Argus eyes" and persuasive ways, would be better paid, and of course, the surveyor's and the architect's fees would be higher, although owners might become rusty, and vow with angry explosion or sullen silence to steer clear of architects, surveyors, and builders in future as much as possible.

Is it not strange that Mr. Stone, who seems so familiar with the dangers and difficulties of the Scylla and Charybdis of long and short quantities, that he so graphically describes, appears to have turned "a blind eye that even Nelson himself might have envied" on the clear calm way between the "long" rock and the "short" whirlpool—correct quantities that he treats as something unknown or impossible. Mr. Stone's protest against the paragraph in your article (in the "B.N.," Aug. 17) that "the plaintiffs soon found that the quantities were very deficient" is also passing strange, for he immediately admits its correctness. You do not say how the deficiencies arose, or who was to blame for them. He says he could have proved that the quantities did not "apply to the church as executed, in consequence of alterations made after they were taken out," and adds "that he was sued for items that were omitted by the express instructions of the architect"; but he further admits in the vague and shuffling terms, "It is quite true that there may have been original vices (!); on the other hand, there may have been excesses," that the quantities were doubly wrong, being viciously "short" and excessively "long," to the loss of both builder and owner; and surely he must have been accountable to either if there was "privity of contract" between them. But, by a rule-of-thumb happy-go-lucky system of equity he thinks one should balance the other, and no doubt it was supposed to be the law, and probably still is where there is "privity of contract" (by the builder agreeing with and receiving the quantities from the surveyor), that the former could only recover for his net loss by errors in the quantities.

As Mr. Stone's letter tends to make "confusion worse confounded" of the decision in "Priestley and Gurney v. Stone," which involves important consequences to all connected with building, I have ventured to refer to it at greater length than may be admissible, and would further suggest that instead of allowing the decision to be strained further than it goes, the R.I.B.A., the R.I.A.I., and all architectural associations and societies should, after consideration and consultation, define the relative duties and liabilities of owners, architects, surveyors, and builders; and, if it is not too late, say how justice should be done to the builders in the above case, who seem to have an equitable claim against the surveyor, who admits "there may have been original vices" in the quantities; the architect, who, by meddling in

the issuing of the quantities, willed "privity of contract," and by (if it is true) altering the drawings and writing the specification after the quantities were taken out, and expressly directing works to be omitted from the quantities that were included in the contract (if this is credible it is not creditable); and the owners, if they do not pay the just value of the work done for them, even though their legal position, like the surveyor's, may be impregnable.

—I am, &c.,  
Aug. 25.

M. M.

SIR,—If the following conditions were observed in arranging a contract, we should, I think, hear but little of such cases as the above:—

(1) The quantities, where practicable, to be prepared by the architect of the works, or, failing this, by a responsible competent surveyor acting for him, but in either case with the full consent of the employer, who should pay directly for them, instead of—as it seems to me—the objectionable secondhand manner, so to speak, now generally adopted.

(2) The quantities to be made part of the contract, and used as the basis for pricing the variations as far as they will apply, and any other to be priced by the architect or his surveyor in a fair and reasonable manner.

(3) A clause should be inserted in the contract allowing either the employer or contractor, in case of any known or suspected discrepancy, by writing, to require any portion of the works to be measured by the architect or his surveyor after completion, and should any excess or deficiency be discovered the same to be adjusted at the contract rates, and in the event of the employer claiming a deduction, or the contractor an extra, which should prove—after measuring up—to be unjustifiable, the costs of the measuring to be borne by the party requiring it; but if an error has been made, the architect or his surveyor is to adjust the same without charge to either party.

I have adopted these conditions for some time, and they have generally given satisfaction to all parties interested.—I am, &c.,

JUSTICE TO ALL.

#### "WANTED, A PROTESTANT CONTRACTOR."

SIR,—Under this heading "J. L. R.," of Dublin, tries to ventilate a would-be Irish grievance! But he is very careful to ignore the fact that in poor Ireland the people who advertise for "Protestant contractors" simply take their cue from the Romanists. How often do we hear of a Roman Catholic in that unfortunate country giving a contract he has the disposal of to a Protestant? We know little or nothing of such narrow-mindedness in England, where the Romanists are in the minority. If "J. L. R." wishes to trace the original of such advertisements as the one he takes present exception to, he can do so in seven letters, by simply reading the word "Priests!" Thank God, in England we are yet

COSMOPOLITAN.

#### STORAGE OF RAINFALL.

SIR,—In the interesting article on Rainfall in the BUILDING NEWS of August 17, mention is made of the separator, a machine for storing clean rain-water.

It may be useful to describe the simple automatic apparatus I have used for this purpose in South America, where rain-water is universally stored for domestic use.

As shown in the sketch, it consists of a metallic box 18in. by 15in. by 6in., and adapted to a 4in. rain-water pipe. It acts in the following manner:—

The cistern A being empty, the weight of the float B keeps the valve C open. The rain-water enters the apparatus through the pipe M, passes through the strainers N N, along the passage D, over a movable weir or gauge E (which can be made of various sizes according to the quantity of water flowing from the roof), to the foul-water pipe F; at the same time a portion of the water enters the cistern A through a small hole or tube G, discharging at a lesser rate through the small tube H, the float B rises with the water in the cistern and closes the valve C, thus diverting the flow to the storage-tank or well. When the rain ceases the cistern is emptied through the tube H, and the valve opens for the next rainfall.

A modified form of the apparatus provides for intermittent rainfalls of intervals of five and six hours.

The machine is so constructed that the water shall not flow into tank until the roof has been thoroughly cleansed, and this is effected by using special gauges to regulate the flow of water to the cistern A.

The cost of the machine in zinc in London is about 30s.—I am, &c.,

JAMES G. KILLEY, A.M.Inst.C.E.

7, Ham Park-road, West Ham, E.

#### CHIPS.

Mr. Philip Blakeway T'Anson, second son of the late President of the Royal Institute of British Architects, died on the 22nd inst. at Headley, Hants, aged 43 years.

The memorial of the 28 men who lost their lives in the explosion at Elemore Colliery, near Newcastle-on-Tyne, in December, 1886, was unveiled on Tuesday in St. Michael's Churchyard, Easington. It is of grey granite with red granite columns, and was designed and executed at a cost of £150 by Messrs. Emley and Sons, of Newcastle.

Dr. Perowne, Dean of Peterborough, makes an appeal for further funds in order to complete the restoration of the cathedral. At least £18,000 is required to secure the safety of the fabric. When that has been done the restoration of the choir will be undertaken. Towards this object some special gifts have been promised, but the Dean and Chapter do not feel it right to begin the internal fittings and decorations till all has been done that the architect recommends in the way of substantial repairs.

The memorial stone of a new public hall and reading-room at Kingussie, N.B., was laid on Wednesday week. The total cost is about £1,400, and the chief hall will measure 42ft. by 32ft., and 24ft. in height, and will be seated for 500 people. Mr. Macintosh, of Inverness, was the architect.

The Free Methodist Chapel at Rodley, near Leeds, although only erected in the year 1860, having become too small for the congregation, a more commodious edifice is being built on the opposite side of the road. The plans have been prepared by Messrs. Kendall and Bakes, architects, Idle, who have adopted "a combination of the Italian and Early English styles" for the building, which is to be of stone throughout. The new chapel will seat 450 persons.

The will of the late William Eden Nesfield, of Brighton, the well-known architect and draughtsman, has been proved, the personality amounting to over £13,000.

A new Wesleyan chapel at Eastleigh, near Southampton, was opened last week. Mr. Stagg was the builder, and the cost was about £500.

# Intercommunication.

## QUESTIONS.

[9727]—**Square Root.**—Would one of your readers kindly give me the square root of 2 mathematically exact? The ordinary rule gives a result in recurring decimals. Cannot an exactly mathematical result be given by means of a vulgar fraction or a mixed fraction, in the same manner as  $\frac{1}{3}$  may be so stated, or as  $0.33\frac{1}{3}$ ?—X.

[9728]—**Fixing Standards on Stone.**—Is sulphur or lead the best fixing for iron standards in stone, and why?—POST.

[9729]—**Furnace Chimney Shafts.**—When these are used for very high temperatures it is usual to line the lower part of them inside with a lining of fire-brick of  $\frac{1}{2}$  brick, 1 brick, or  $1\frac{1}{2}$  brick thick, as the case may require, and it is usual to leave a space between this fire-brick lining and the brickwork of the shaft, to allow room for the diametrical expansion of the lining, so that, taking the case of a round shaft, the lining forms a separate cylinder within the cylinder of the shaft, with a small space between the outside surface of the inner cylinder and the inside surface of the outer cylinder. If this space be left open at the top it gets filled with flue dust, which, being heavy and compact, communicates the expansion of the inner cylinder to the outer one, and the *raison d'être* of the arrangement is lost. If the space be covered over at the level of the top of the inner cylinder, I am told that mischief is sometimes worked by the explosion of gases in the inclosed space. If, to prevent this, air bricks are let in at top and bottom of the space, communicating with the outer air, so as to keep the space always ventilated, the draught of the chimney is injuriously affected by cooling the outside surface of the inner cylinder, and so facilitating loss of heat from the interior of the chimney by radiation; and if the covering of the space should become accidentally misplaced in part, this arrangement would have the evil effect of letting cold air directly into the flue. Which, on the whole, is best—to cover, or leave uncovered, the space between the lining and the chimney? I assume that if covered the covering bricks should not be bonded into the chimney, but merely touch or abut against it at their ends. Is that right?—X.

[9730]—**Hot-Water Pipes.**—Will "H. E." give the maker's name of the glass-lined pipe referred to by him in a reply given in the BUILDING NEWS, May, 21, 1886, No. 8826?—J. S.

[9731]—**Claim for Damage from Settlement.**—A and B. between them own a pair of semi-detached houses—i.e., A. has one, and B. the other. A's house shows signs of rupture from settlement, and has had a few repairs in consequence. B. wants to know if he would have any claim against A. for any damage that may accrue to his house consequent on the settlement of A's house?—A. H. H.

[9732]—**Contractors and Quantities.**—When an architect has provided quantities for the convenience of contractors tendering, can a contractor, if he wills, take off his own and ignore those prepared, and after doing so, should he be accepted, can he repudiate the claim of the surveyor for quantities?—FAIRFAX.

[9733]—**Plans of Old Buildings.**—What is the best method to adopt where accuracy is advisable in taking measurements in detail of the interiors of old buildings—which are frequently of irregular shape, and mostly plastered—for the purpose of preparing plans for alterations and additions to the fabric?—WILLING LEARNER.

[9734]—**Contract and Conditions.**—Will some of your able correspondents state where the one ends and the other begins, and how to draw the line between the two?—DOUBTFUL TOMMY.

[9735]—**Timber.**—I have been reading Mr. Stevenson's interesting book, "Trees of Commerce." Would Mr. Stevenson, or some of your readers, kindly inform me what is the meaning of "thick baited," as applied to fir trees, at page 159? I assume that the term, "Southern Russian ports," used in other parts of the book, do not really refer to southern ports of Russia, but to southern ports of North Russia. I suppose the southern ports of Russia are really in the Black Sea, from whence we do not get timber.—R.

[9736]—**Honours Exam. in Building Construction.**—Would some reader of the "B. N." kindly inform me what book on chemistry I should get in order to understand the chemical terms in Rivington's Vol. III., the name of publisher, and price? Perhaps the gentleman who answered my last question relating to this exam. would kindly oblige.—VERITAS.

[9737]—**Quantity Surveyor's Fees.**—I shall esteem it a favour if any reader will reply to the following questions:—1. Am I right in believing that the proprietor of a building is liable to a surveyor for quantities if the works are not carried out? 2. If works are carried out, is the builder liable? 3. Would the architect be liable if he did not disclose the name of his principal in the event of the principal refusing to pay when the works are not carried out?—QUANTITY SURVEYOR.

[9738]—**Grubs.**—Will any of your readers inform me what is the best course to adopt under the following circumstances?—Having erected some stabling two years ago, I now find the woodwork (especially in hay loft and harness-room) swarming with small white grubs. Wood naphtha has been applied, but without having any material effect.—A. T.

[9739]—**Durham and Yorkshire.**—Intending to take a holiday in South Durham and North Yorkshire, shall be glad if any kind reader will give places worth visiting and sketching, and best way of reaching same.—CONSTANT READER.

## REPLIES.

[9712]—**Theatre Exits.**—"Exit" will find the information he requires in the BUILDING NEWS, Feb. 3, 1888, in the review of a work entitled "Theatre Construction and Maintenance," by J. G. Buckle, A.R.I.B.A.,—STAGE DOOR.

[9712]—**Theatre Exits.**—I cannot put my hand upon some notes made on this subject a few years since, but am of opinion that Captain Shaw refers to it in his reports on theatres to the Metropolitan Board of Works some four years since. Why does not "Exit" obtain permission to take notes from personal observation at the doors of, say, two theatres?—H. L.

[9714]—**"Redcoat" Knock, Belfast.**—The accompanying plan will, I trust, clearly explain the point upon which "Provincial Architect" desires information. The heavily-shaded octagonal joints, one of which is shown on either side of bay, are stone piers; the dotted

lines directly connecting these indicate the position of a double row of railway bars, carrying the ends of beams, tailing well into walls.—T. MCC. JOHNSTON.

[9715]—**Western Towers.**—I am not aware of many churches near London of the description given. In Norfolk and Somersetshire there are many of these. I may mention Worstead Church, Norfolk; Filby Church, Marthon Church, Hingham Church, Deopham Church, and several others. In Somersetshire I may mention the fine church of St. Cuthbert, Wells, with a splendid Perpendicular tower; Evercech Church, and several more, in which the tower opens by a lofty arch into the nave.—G. H. G.

[9716]—**Load on Roof Truss.**—The load is distributed on the ridge and points of support of each principal rafter. The load is made up of the slate or other covering, the roof boarding, and the roof framing, including snow and wind. For an ordinary roof, a load of 50lb. per sq. ft. horizontal may be taken. This load equals half the pressure per foot of inclined surface, multiplied by the length of rafter, divided by the span, both in feet. For explanation of the manner of distributing the loads, see any treatise on graphic statics, or consult answers in the BUILDING NEWS, where several replies to this question have been given.—G. H. G.

[9716]—**Load on Roof Truss.**—"T. E. R." gives no idea of the span or construction of the roof. It is generally assumed that the weight is at the apex, causing the feet of rafters to spread. Refer to the diagrams in pages 73, &c., "Science of Building," by E. W. Tarn, M.A.—H. L.

[9718]—**Characteristics of Masonry.**—I think that "D." will find that the 12th-century joints are wide and the mortar of coarse sand. As Gothic architecture progressed the joints decreased in thickness.—H. L.

[9718]—**Characteristics of Masonry.**—The vertical joints are often wide in the earlier examples, and the stones large; later in the 12th century, smaller stones were used. The mortar was generally of lime, with large grit or sand; but it is impossible to draw any further distinction between masonry of different localities than that which was due to the materials quarried and used.—G. H. G.

[9719]—**Easter Sepulchre.**—This was often a recess or arched canopy in the wall, and was on the north side of chancel, not far from the altar. Examples are to be seen at Heckington, Lincolnshire; Holcombe, Burnell, Devon, and in several churches in Somersetshire, Oxfordshire, Norfolk, &c.—G. H. G.

[9721]—**To Estimate Brickwork.**—There is nothing very difficult in working out brickwork on the abstract with two columns. I know of no tables.—H. L.

[9723]—**Portland Cement Slabs.**—I see no reason except convenience of transport for limiting the size of cement concrete slabs. Certainly 6ft. by 3ft. by 6in. could be made and taken anywhere with care. Would it not be better to make the landing, or whatever it is in position, and thus save risk of cracking, &c.?—H. L.

[9724]—**Quantities.**—At one time all specifications provided for the joists being notched on to the plates, and it is the custom to describe all floor joists except ground joists as fir framed.—H. LOVEGROVE.

Museum-street Wesleyan chapel, Ipswich, a building in the French Decorated style, erected in 1860 from plans by Mr. F. Barnes, F.R.I.B.A., of that town, was reopened on Tuesday week after restoration, including renovation and reinstatement of freestone dressings, and improvement of the heating and lighting—works carried out at a cost of £600 from plans by Mr. William Eade, F.R.I.B.A., of Ipswich.

## WATER SUPPLY AND SANITARY MATTERS.

STAFFORD.—The twenty-one days' pumping required by the Local Government Board having been completed at the Milford Well, the members of the Stafford Waterworks Committee visited the works. Among those present at the pumping-station were the mayor, Messrs. W. B. Rudge and G. Griffith (the contractors), and Mr. Blackshaw (the borough surveyor). A well 4ft. 6in. in dia-

meter had been sunk near the permanent well, which is 12ft. in diameter, and which, after a depth of about 15ft. had been reached, it was found impossible to sink further on account of the influx of water, and continuous pumping for twenty-one days was therefore commenced on July 30 in the little shaft. During that time no less than 9,735,578 gallons of water has been raised, or an average of 463,599 gallons every 24 hours. This is 63,599 gallons in excess of the contract. The party were also conducted by Mr. Blackshaw to the proposed site of the reservoir, which is some half-mile further in the Colwich direction.

## LEGAL INTELLIGENCE.

INSUFFICIENT AIR SPACE TO DWELLINGS.—Mr. Justice Denman, sitting as Vacation Judge in the Chancery Division of the High Court of Justice, had an application made to him on the 23rd inst. to restrain the Doncaster Sanitary Authority from pulling down a house on the ground that it had been so erected as not to comply with a by-law prescribing a certain amount of air space behind the house. It is alleged that the applicant, since the erection of the house, had purchased a portion of a field sufficient to enable him to provide the requisite air space. His Lordship granted an injunction for a week.

HAWKESLEY V. LIVERPOOL CORPORATION.—AWARD OF THE ARBITRATOR.—Mr. Bosanquet, Q.C., the arbitrator appointed by consent to deal with the claim of Mr. Thomas Hawksley, M.Inst.C.E., against the Corporation of Liverpool, for services rendered in connection with the Vyrnwy water scheme, has now given his award. The terms of the award are that Mr. Hawksley receive £14,123 in addition to the sums, £20,617 in all, already paid to him by the Corporation, and that the latter bear all the costs of the arbitration, which will reach a very considerable amount. The case was reported in our issues of April 6 and June 1 of the present year, pp. 519, 761, last Vol. It will be remembered that Mr. Hawksley broke off his association with the Vyrnwy scheme when he found that Mr. G. F. Deason was named as joint engineer with himself. The award will come before the Water Committee on Monday next.

A discovery which tends to establish a Roman occupation of Peterborough has been brought to light during the past week. In the north transept of the cathedral, beneath the Saxon level, and 9ft. or 10ft. from the present surface, there was found an ancient well rudely cut in the rock. Only a corner was enabled to be uncovered in the present excavation, and from this were extracted fragments of Roman pottery and a number of wedged-shaped bricks roughly burned in hedge choppings, similar to the old Dutch clinkers. The largest was six inches in length. Some are much broken.

In the list of receiving orders is the name of Henry John Paull, of Burghley-road, Kentish-town, carrying on business with A. A. Bonella at Quality-court, architect.

Aug. 31, 1888.

## Our Office Table.

A LOAN exhibition of old masters was opened on Tuesday in the Birmingham Municipal Art Gallery, and comprises some 120 works executed between the beginning of the 16th and the end of the 18th century. The nucleus of the exhibition consists of some 90 works selected from the gallery of portraits belonging to Sir Thomas Barrett Lennard, of Belhus, Surrey. This collection, which has hitherto been seen only by the favoured few, has been made from generation to generation from about 1580 to the present time. All the principal persons of the family descended from Sir Samuel Lennard since its settlement in Kent towards the close of the reign of Queen Elizabeth had their portraits painted by the most eminent artists of their day, among them being Hans Holbein, Lucas de Heere, Cornelius Janssen, Sir Anthony Van Dyck, Francois de Troy, Michael Dahl, and Sir Peter Lely. Other contributors are the Duke of Westminster, who lends ten works from Grosvenor House; the Duke of Norfolk, who has allowed three Van Dycks to be taken from Arundel Castle; the Marquis of Hertford, the Marquis of Lansdowne, the Earl of Dartmouth, Lord Windsor, the Earl of Coventry, Mr. H. Pfungst (to whom the gallery is indebted for a loan collection of antique majolica), Mr. W. Agnew, Mr. Whately, of Clifton, and the Rev. Mr. Nicholson, of Droitwich. A few blanks are filled by loans from South Kensington.

A SOCIETY has been formed with the object of promoting the long-neglected restoration of ancient crosses. In past ages no churchyard was considered complete without its cross, while the same symbol was often the most conspicuous adornment of market-places, and in remoter districts was a no less familiar object by the wayside or the fountain. At the same time within the church the great rood was treated as second only to the altar itself. It is not, therefore, surprising that the number of existing remains is very considerable. Over 200 of these outdoor crosses are said to survive in the county of Somerset alone; but hitherto comparatively few have been rescued from profanation and neglect. In most cases a base or socket, frequently raised on steps, with occasionally a broken shaft, is all that remains. But these, lacking as they do the emblem of the Christian religion (to carry which was the very purpose of their erection), are now meaningless, except as witnesses to the indifference, or worse, of recent generations. It is not desired in any way to renovate these venerable monuments, and so to destroy their artistic or antiquarian interest, but merely to make good the ravages, not so much of natural decay as of wanton sacrilege. Nor does the society intend to supplant, but rather to stimulate, local effort and enthusiasm; though at the same time, by contributing a fair proportion of the necessary expense, it would render possible, even in the poorest districts, the execution of satisfactory designs. The society will probably confine its earlier efforts to the re-erection of churchyard crosses only, with the hope, however, of ultimately including wayside, rood, and other crosses within the scope of its action. The annual subscription is half-a-guinea for members and five shillings for associates, due upon the 1st of January each year. Subscriptions may be compounded for a life payment of ten guineas. Application for membership to be made to F. C. Eden, The Cottage, Ham Common, Surrey.

THE annual statement of the general progress at the British Museum states that a commencement has been made of an exhibition of the Greek and Roman sepulchral monuments and other sculpture hitherto stored away in imperfectly-lighted rooms in the basement of the Museum. Intended structural alterations have been postponed owing to disappointment in the necessary supply of funds asked for, and promised, for the past year. It is expected that provision for these works will be made in the grant for the year 1888-1889, and that the remainder of the monuments will find adequate exhibition space in a well-lighted lower floor of the present room. From apprehension of injury by exposure to light and changes of atmosphere, it has been found necessary to remove from the walls of the north-west staircase

the framed Egyptian papyri exhibited there for many years, but a small selection has been placed on view in the Upper Egyptian Gallery. The wall-space of the staircase will be covered with mosaics from Carthage, Halicarnassus, and other sites, many of them not before exhibited. In the other gallery has been placed on view a series of Japanese paintings, with a few early Chinese works, taken from the collection formed by Mr. William Anderson, and purchased from him in 1883. Attention is again called to the inadequacy of the present reading-room for accommodation of the ever-increasing number of applicants for admission. The number of visitors to the room has risen from 105,310 in 1875, to 182,773 last year. No further addition can be made to the number of seats without inconveniently diminishing the desk space allotted to each reader.

Mr. Fox, C.E., has made for the Dean and Chapter of Durham a survey of the river Wear within the city with reference to the sanitary improvement of the district, and especially the proposed heightening of the Old Museum Weir. He points out that no fewer than 42 sewers empty into the river between the Baths and Prebends' Bridges (a distance of about three-fourths of a mile), and, although the river on the date of inspection was at about its ordinary level for this time of the year, 24 of the sewer outlets were exposed to view, and standing from 3in. to 2ft. 6in above the water level. If the weir is heightened 18in. there will be, he says, only four of the above river outlets exposed to view in all ordinary states of the river, and these could easily be continued further into the river, so as to have their outlets below the water level. The lowest possible height the weir should be raised or heightened, so as to effectually cover the sewer outlets in all ordinary states of the river, between the Baths and Prebends' Bridge, is 18in., and this will not, Mr. Fox believes, in the ordinary floods to which the river is subject, increase, in any appreciable degree, the present danger to properties on either side of the river. Should the weir be heightened as proposed, the extra depth of water in the river will be, he thinks, a sanitary improvement of importance to the inhabitants of the city, and the river will then be navigable from the University boat landing to a little above Shincliffe Bridge (a distance of about 2½ miles), in all ordinary states of the river.

A VERY useful compendium of the leading universities, colleges, and technical schools in America has been compiled by Mr. C. Powell Karr, C.E., Ph.B., of the School of Mines, Columbia College, an architect and member of the New York Architectural League, which gives in a comprehensive and tabular form the courses of study pursued, the requirements of admission, the cost of a collegiate or technical course of instruction, and other particulars. Such a guide was the more necessary, owing to the rapid increase of new universities and colleges. No less than seventy-four of the leading educational establishments of the United States and Canada have been tabulated by Mr. Karr, and one of the tables gives a list of the textbooks required in every college. To architectural and engineering students, as well as to those pursuing other professions, Mr. Powell Karr's Manual will be of signal service.

ARCHITECTS will find Mr. James Hill's new catalogue of locks, door furniture, and other ironmongery accessories most useful in writing specifications, as it practically covers its field and is so well arranged. Each separate class of goods is figured, numbered, and priced on the same page, black and bronze samples are distinguished artistically and accurately, and it is absolutely impossible to make a mistake in ordering. The well-known reversible rim and four-handed brass-rim locks head the list, and are followed in turn by the various specialities which have made Mr. Hill's name familiar. Mortise locks, latches, escutcheons, hinges, handles, door furniture, finger-plates, lock-plates, bell-pushes, bell-pulls, knockers, sash-handles and lifts, casement bolts and bars follow, and a new fanlight and skylight opener, which is as novel as it is ingenious, and about which we shall have a word to say separately shortly. Altogether the catalogue is among the best and most comprehensive of its class.

ON Saturday, Aug. 25th, a section of the employees of Messrs. Gregory and Co., Station

Works, Clapham Junction, held their annual excursion and dinner, leaving Clapham Junction by an early train for Portsmouth. They spent the morning in visiting the dockyard, Southsea, and other places of interest, and mustered for dinner at Maybore's Restaurant. Mr. G. C. Hudson (one of the partners) presided at a very well-served dinner, after which the usual toasts were honoured. Mr. Hudson, in replying to the toast of "The Firm," hoped that the good feeling between all parties so evident this day would increase day by day, and not be confined to special occasions like the present, and that each succeeding meeting might, if possible, find the interest of all connected with the firm more firmly cemented. The party, numbering about 100, left Portsmouth at 2.15 for the Isle of Wight, returning to Clapham Junction via Portsmouth, reaching home about ten o'clock, after having spent a thoroughly enjoyable day.

### MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Clerk of Works' Association. Monthly meeting, Carpenters' Hall. 8 p.m.  
TUESDAY.—Glasgow Architectural Association. "A Tour in Italy," by W. J. Anderson, "Alexander Thomson" Travelling student.  
SATURDAY.—Architectural Association. Visit to Hatfield House. Booking-offices, G.N.R., 2 p.m. Special ticket, 2s. 6d.

Architectural Association.—The sixth vacation visit will be made on Saturday, September 8th, to Hatfield House. Names, with postal order for 2s. 6d., to be sent to Mr. Ernest S. Gale, 5, York-buildings, Adelphi, not later than Wednesday, Sept. 5th. Party to meet in the booking office at King's Cross, G.N.R., at 2 p.m. Thos. Edward Pryce and Frederic R. Farrow, Hon. Secs.

### CHIPS.

The Wesleyan chapel at Cirencester was reopened on Thursday, the 23rd inst., after internal restoration, including new panelled ceiling of pitch pine, reseating, and improvement of the lighting. Mr. William Newcombe, of Cirencester, was the builder.

At a vestry meeting held at Bishopstoke, Hants, last week, it was decided to erect a new parish church in place of the existing one, erected on the site of a Norman building in 1826. Towards the cost, estimated at £4,000, £1,000 has been given by one donor, besides an acre of land as a site.

On Wednesday week foundation-stones of a new Primitive Methodist Chapel were laid at the village of Scackleton, near Hovingham. The building will cost about £200, and will have seats for 120 people. The design is by Mr. C. H. Channon, Malton.

A monument to the Brereton family hitherto blocking up one of the windows in the chancel of Bowden parish church, Cheshire, has just been removed to the north transept, Messrs. Sheldon and Morton being the contractors. The window so opened out has been filled with stained glass as a memorial to the late R. A. Warburton; the subject is the Ascension, and the work has been carried out by Messrs. Burlison and Grylls, of London.

The new boys' public day schools, Kentish-town, are warmed and ventilated by means of the patent Manchester grates supplied by Mr. E. H. Shorland, of Manchester and London.

At a special meeting of the Belfast Water Commissioners, held last week, it was decided, on the advice of the engineer, that a cheque for £1,500, in favour of Messrs. Fitzpatrick Bros., Great Victoria-street, Belfast, be signed, being a bonus for having the contract for the culvert connecting the Stoneyford with the Lagmore reservoir completed under the specified time.

Alterations have been made to the Masonic Hall, Hong Kong, including the ventilation; Messrs. Robert Boyle and Son's latest improved self-acting, air-pump ventilators being adopted for the extraction of the vitiated air.

On Saturday the memorial stone of a new Established Church at Shawlands was laid by Sir John Maxwell, of Nether Pollock. The style is Early English, and the estimated cost of the building, together with a suite of halls, is about £6,000.

A Local Government Board inquiry as to the application of the Corporation of Manchester to borrow £450,000 for the purpose of carrying out a sewage scheme, and £40,000 for the purchase of land on which to deal with the sewage deposit of the city, has been fixed for the 10th September. Opposition to the scheme will be offered by the Barton-upon-Irwell Rural Sanitary Authority, the Local Board of Eccles, property owners and residents of Davyhulme and Urmston, and others.

## Trade News.

### WAGES MOVEMENTS.

**LEEDS.**—At the request of the committee of the Leeds Carpenters and Joiners' Association, the masters have agreed to meet a deputation from the men this (Friday) evening, with a view to arriving at some settlement with regard to the strike which has existed during the last few weeks.

### CHIPS.

A mummy and portrait, recovered by Mr. Flinders Petrie from the Necropolis, built in Græco-Roman days, on the site of the Labyrinth in the El Fayoum, have been presented to the Peel Park Museum, Salford. The portrait is that of a boy, is painted in wax on a cedar panel, and is of the second century of the Christian Era.

The Grove Wesleyan Chapel at York was reopened on Friday on the completion of internal decoration, carried out by Messrs. W. Bellerby and Sons, of Petergate, and the erection of an organ, built by Messrs. Forster and Andrews, of Hull.

The late Mr. T. Heygate Vernon, A.R.I.B.A., who for several years carried on the professional practice of Mr. E. M. Barry, R.A., has now been succeeded by Mr. E. Elton Hawkins, of 19, York Buildings, Adelphi, W.C. The latter gentleman was for a long period associated with both the deceased architects.

Norwich Castle, so long used as a prison, having been acquired by the corporation, will, at a cost of about £11,000, be turned into a public museum and art gallery. The greater part of the money has been subscribed or promised, and the alterations will shortly be proceeded with.

A memorial has just been erected in Dingwall churchyard to the memory of Frank Harper, Torgorm, who half a century ago was known as the champion athlete of that county, and was the first to introduce, about forty years ago, the games of curling, bowling, and cricket into Ross-shire. The memorial consists of a marble medallion portrait of Harper by Mr. Andrew Davidson, Inverness, inserted in a slab of red sandstone from Dumfriesshire.

The new line of the London, Chatham, and Dover Railway from Blackheath Hill to Stockwell-street, Greenwich, on the Nunhead branch, which has just been completed, will be opened for traffic to-morrow (Saturday).

On Saturday the new Temperance Hall at Ossett was opened. The new premises are of stone, two stories high. The ground floor is occupied by a small lecture-room, reading-room, committee-room, &c.; and above them is the hall proper, 66ft. by 34ft., with end gallery. The hall will be seated for 550 persons. The cost of building and furnishing amounts to £1,500.

Two miles of tramways have just been completed by the Bradford Tramway Company between Frizinghall and Saltaire, and were formally opened by Major-General Hutchinson, of the Board of Trade, on Wednesday week. Mr. Cartwright was the engineer, Mr. Dowell the contractor, and Mr. Morgan the clerk of works.

An important addition to the premises of the Birmingham Library, Union-street, was thrown open on Monday. This addition consists of a gentlemen's smoking-room, a ladies' drawing-room, and a librarian's room, with entrance lobby opening into the ground floor of the old library premises. The walls of all the new rooms and of the lobby are covered with shelves which can be made capable of storing about 20,000 volumes. The building and fitting-up was carried out by Messrs. J. Barnsley and Sons, and the furniture was supplied by Messrs. Morris and Norton and Messrs. Chamberlain, King, and Jones. The hot-water fittings are by Messrs. Hope.

A special meeting of the Highway Committee of the Sheffield Town Council was held on Tuesday for the purpose of recommending a candidate for the office of borough surveyor. There were originally 150 applicants for the post. These were reduced to six, each of whom attended before the committee on Tuesday. It was decided to recommend Mr. Charles F. Wike, C.E., assistant borough surveyor, Leicester, to the council for appointment. The salary is £800 per annum.

A new Free Church in Glebeside-road, Galston, N.B., was opened on the 23rd inst. The building is in the Early English style, and the number of sittings provided is 560. The total cost has been £2,500.

The Stockton-on-Tees School Board have purchased a site, containing 4,050 square yards, in Oxbridge-lane, and instructed their architect, Mr. Weatherill, to prepare drawings for a school to accommodate 700 scholars. Additions to Bailey street schools are also contemplated.

**Holloway's Ointment.**—Sores, wounds, ulcerations, and other diseases affecting the skin, are capable of speedily amendment by this cooling and healing Ointment, which has called forth the loudest praise from persons who had suffered for years from bad legs, bad breasts, piles, abscesses, and chronic ulcers, after every hope of cure had long passed away.

**HYATT'S LENS and "SEMI-PRISM"** LIGHTS for PAVEMENTS, STALLBOARDS, ROOFS, &c. TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringden-road, London, E.C.

### DOULTING FREESTONE.

**THE CHELYNCH STONE.**—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

**THE BRAMLEDITCH STONE** is of the same crystalline nature as the Chelynoch Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to **CHARLES TRASK and SONS**, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

### HAM HILL STONE.

Greater facilities have been provided for working these Quarries, and the Stone can be supplied in large quantities at short notice.

Prices and every information given on application to **THE HAM HILL STONE CO.**, NORTON, STOKE-UNDER-HAM, SOMERSET. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

**WM. OLIVER & SONS,** MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,

120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

To Municipal Authorities, Engineers, and Surveyors.

## JENNINGS' PATENT URINALS

FOR PUBLIC THOROUGHFARES AND RAILWAY STATIONS,

Have been adopted in all the principal European Cities. They are particularly adapted for public use, being simple in construction, strong, and most economical as regards the water supply.

## JENNINGS' STONEWARE DRAIN-PIPES

Have been specially selected and adopted, after severe tests, by the South Australian Government for the drainage of Adelaide. The Sockets and Pipes are made in one piece under great pressure by Steam Machinery from the finest selected Poole Clay taken from Beds on the works, and, by hydraulic testing, have been proved superior to any other pipes in the market.

Prices and particulars can be obtained from

**GEORGE JENNINGS, STANGATE, LAMBETH, LONDON,**  
And the Manager, South-Western Pottery, Parkstone, Poole, Dorset.

## F. BRABY & CO., LD.

### CISTERNS AND TANKS,

GALVANIZED OR PAINTED.

### CIRCULATING CYLINDERS

FOR HOT WATER,

GALVANIZED IRON, OR COPPER. MANY EXTRA SIZES ARE NOW STOCKED. DELIVERY IMMEDIATE.

**LONDON:**  
352 TO 362, EUSTON ROAD.

**LIVERPOOL:**  
6 & 8, HATTON GARDEN.

**GLASGOW:**  
47 & 49, ST. ENOCH SQUARE.

# THE BUILDING NEWS AND ENGINEERING JOURNAL.

VOL. LV.—No. 1757.

FRIDAY, SEPTEMBER 7, 1888.

## THE ARCHITECTURAL USE OF CEMENT.

WHY did cement and stucco architecture die so suddenly and ignominiously? Other materials that have taken their place—brick, terracotta, half-timber work—have retained their popularity mainly because they became visible protests against what was regarded as a sham and a counterfeit. There was nothing radically wrong about Portland cement. Except that it could so easily be made covering to brickwork, and lent itself so obviously to imitate carved stonework, nothing could be said against a material of the greatest value in construction. Architects designed elevations in it upon the principles of worked and carved stone; but they unfortunately sacrificed its reputation by so doing. It was cheaper than stone, and upon this rock the material fell to grief. A building was designed for Portland stone; the elevations were prepared accordingly with moulded and enriched cornices of large projection, stringcourses, architraves, and pediments to windows and doors, carved ornament, quoins, and other things, all very proper things for stone. The tenders came out too high, and the fatal suggestion occurred that it could be carried out in cement at half the cost. Who could resist the temptation to have a costly stone front executed in a material so like stone, and even more durable? This was the fatal rock upon which cement architecture was wrecked. Every little builder tried his hand at designing fronts with all the Classical details and ornament which at one time were only lavished on costly edifices. Every style of architecture could be copied in a material so plastic, so readily moulded into any form. The reign of stucco was not a long one. Half a century ago Brighton and a score of other towns rising into notice were rebuilt in cement, and it was beginning to be the taunt that, unlike the Romans, who found some brick and left it of marble, we were speedily reversing the boast by finding our buildings of stone and brick and leaving them of cement. The anti-stucco crusade set in, and in less than a decade or two the disuse of cement became marked. A great many suggestions for treating cement as cement were thrown out; but there was a popular revulsion of feeling, and the very name of cement was held in disrepute.

After the lapse of twenty years the profession can look with calmness and equanimity upon the change, and all the angry things that were said for and against cement. We have now passed the stage of imitation, and have reached that of inquiry into principles—criticism. We now see exactly why was that our predecessors erred in the use of cement; how absurd and improper it was to imitate stone forms and stone treatment in cement or any other plastic material. When we look at one of these cement-fronted buildings we can see the mistake into which the stucco architect fell. His cornice was exactly like one of stone, projecting to the full extent, with heavy trusses or modillions of the same material. He did not think it wrong to produce this projection by subterfuge, by inserting a core of rough stone and brick upon which to run his cement mouldings. His window or door pediments, even engaged columns, were constructed in the same manner by rough cores cemented over. All these features if of stone would be solidly constructed, but in cement the only way was to bring them out, and then encase them. All

high relief ornament, deep mouldings, were equally as objectionable as block cornices, contrary to the proper treatment of cement. Cores could be formed anywhere, and projections and ornament appeared that would be impossible in stone construction. All these features were then clearly improper in cement. Blocked cornices, pediments, engaged columns, and pilasters, and high relief mouldings properly were stone features. Another practice which added to the offence, and which was a direct falsehood in construction, was the jointing of the cement work and the use of angle quoins.

Having pointed out the nature of the wrong treatment, the employment of an architecture which was essentially derived from stone construction, we have now to consider the nature of cement and how it can be used architecturally. We do not advocate the use of cement in preference to stone or brick, but we desire to point out that it may be used in quite as inoffensive and artistic a manner as any other material. What, then, are the principles for the architect's guidance? We may state it as a leading postulate that, as cement is a plastic substance and is applied in a semi-liquid state, it should be treated as a thin coat laid over another material. This proposition being established, it follows that any attempt to treat it in imitation of worked stone is a great mistake; it follows also that the coating should be broadly laid and in flat surfaces; that all mouldings should be run in the thickness of the cement, and generally that all ornament should be shallow and on the surface. Following these principles or maxims, let us see how we can apply them to an ordinary façade to take the cornice. Carrying out our rules, the cornice should be of shallow projection; instead of composed of several solid members, the ornament would properly consist of a shallow cove or flat, frieze-like ornament in incised lines. If colour be introduced, this is one of the best places for it. The wall surfaces, on the same principle, will be left flat, with incised ornament introduced in panels or in courses. Mouldings run in the thickness of the cement or of very slight projection, splays, and bands of encaustic tiles, and stencil plaster work in coloured cement will be the proper mode of dividing the front horizontally. The mode of treating window dressings should follow the flat treatment. Instead of moulded architraves, sunken members or lines appear to be the legitimate means of obtaining relief or moulded splays round the reveals. The hackneyed trusses are indefensible decorations, and so also are keystones. A flat, slight, projecting band round the opening, relieved by sunken lines or flutings, forms an effective dressing. There are few examples to which the architect can look for inspiration. The nearest approach to cement treatment we can recall to mind is the flat incised ornamentation adopted in many of the neo-Greek buildings in Paris and Glasgow, in which moulded projections are very shallow and sparingly introduced. Sir John Soane, in his museum in Lincoln's Inn-fields and in the Bank of England, has used very appropriately the flat treatment, and these are two of the few instances to be seen in London.

The texture or surface of cement, which is granular, ought to be considered. The finish given by a wood float is best suited to large flat surfaces, though the sand which works up soon gets discoloured by soot in large towns, and for this reason the smoother surface produced by the steel trowel is considered desirable. Stucco as an architectural covering was not only wrongly used, but its artistic capabilities were ignored by the early stuccoists, whose only aim appears to have been to represent stonework. It is extraordinary that the use of colour has hitherto been ignored by modern architects. We believe there would be a future for cement

and plaster if architects would introduce methods of ornamentation especially adapted to those materials. We know that the ancient Egyptians and Greeks used thin coatings of plaster for painting. At Pompeii stucco incrustations have been found which were decorated by colour. In many of our old abbeys and churches this thin coating of plaster is to be noticed, upon which decorations and scriptural subjects were painted, and many of the rubble-filled vaults were so finished.

Decorative plastering is still an undeveloped art amongst us. Confining our attention to outside cement work, we may notice how easily the often unpleasant colour of Portland cement may be disguised by the use of coloured sands and mineral colours, like oxides of iron. These will give us dark red, Venetian red, light red, ultramarine, a tint of blue, or grey. The cement is best coloured before working, and the colouring ingredients mixed dry. More might be done in flat surface decoration, as in the Italian sgraffito work, where layers of coloured cement may be made available by scratching or cutting out the upper coating in ornamental forms. The experiments made in this direction some years ago at Kensington were not satisfactory. One of the simplest modes of decorating cement surfaces is to use stencil plates of a certain thickness, which are embedded on a layer of coloured cement; the upper or finishing coating is then laid on flush with them; the plates being removed exhibit the pattern. Then we can stamp or impress patterns on the wet surface, producing a kind of diaper ornament. There are, in short, many ways by which cement, as an external covering, may be treated in a manner quite in keeping with its nature and artistic capabilities. If coloured bands or panels, incrustation and tile-work, and mineral colours in the preparation of the cement were brought into requisition, we might have a new and durable sort of architecture, and be spared the infliction of the sham castings and ornament, quoins, and other devices which became so intolerable under the old regime.

## NUISANCE BY NOISE.

THERE is no doubt that in our cities and towns the form of nuisance by noise has increased of late years, and is likely to increase yet more. As a general rule, such noise must be put up with, and made the best of, as one of the drawbacks of town life. But when the noise becomes so excessive as to interfere with the ordinary comfort of individuals, the Chancery Division will still grant an injunction. The points to be noted in regard to the rules of law regulating these injunctions are, firstly, that the noise must be really excessive, and, secondly, that the tenants or lessees alone are liable; their landlords or lessors only becoming themselves responsible when it can be proved that they knew of the purposes for which it was intended that the premises should be used. This point, as to the liability of owners, is of great practical importance, for a right of action against a mere occupier, who may only hold weekly, is of little if any value. There have recently been two cases before the Chancery Division, in which both these points were considered, and which are instructive and interesting. But before dealing with these it is necessary, to make the matter clear, that we should go back to the decision of Mr. Justice Kekewich in the action of "Winter v. Baker" (21 April, 1887), because this was referred to in the later cases. That was an action by the plaintiff, a gentleman residing at Brentwood, Essex, against the defendant, Baker, who owned a yard adjoining his premises, and his tenant, Davies, to whom it was let by the

week. The plaintiff sought to restrain both defendants from continuing a nuisance by noise, which consisted of steam roundabouts, organs, swings, shooting-gallery, and general shouting and crowding. The judge held that the nuisance was proved, and he granted an injunction against both landlord and tenant, with costs. The ground upon which judgment was given against Baker, the owner, was that, although a man was not in general liable for nuisances committed by his tenant, yet this defendant had made himself a party to the nuisance by letting the yard, knowing how it was to be used, and still more by letting it for a second week after he had had actual experience of the nuisance by noise during the first week.

In the recent case of "*Jenkins v. Jackson*" (Aug. 3, 1888), the questions raised were rather more complicated. The plaintiff was an accountant, and he was the tenant of Jackson—one of the defendants—of two rooms on the first floor of a house in Cardiff, in which house the other defendant, Summers, was also a tenant, but of the second floor. Thus, they were tenants of the same landlord, holding rooms in floors one above the other. The defendant Summers held harmonic meetings and similar musical entertainments in a large room let to him for this purpose; and the plaintiff now complained that those entertainments were accompanied with great noise and vibration, and that an intolerable nuisance was occasioned by the offensive behaviour of persons when going upstairs to these entertainments, and he asked for an injunction and costs. There was, of course, the usual conflicting evidence as to the facts, and the customary gross exaggeration as to the noise, from both sides; but Mr. Justice Kekewich held it to be proved that there was such an amount of noise and vibration caused by the music and dancing over his head as to seriously interfere with the conduct of the plaintiff's business. Thus he ruled that the existence of a nuisance was proved; then came the questions raised by the defence. It was alleged by the defendant that the plaintiff had taken his offices knowing the sort of place under which he was about to locate himself; but the judge declined to adopt this defence, as it would amount to accepting a now exploded doctrine as to coming to a nuisance. Then the defendant urged that the plaintiff had, by submitting to the annoyance for two years, though with complaints, acquiesced in its continuance, and so had no case. As a defence this failed; but it was an important fact, so far as it tended to show that the actual annoyance could not have been so great as the plaintiff now contended.

The most important point as a matter of general interest was in regard to the plaintiff's rights against his landlord, the defendant Jackson. The case against him was based partly upon his covenant for "quiet enjoyment" as contained in the lease under which plaintiff held his offices. But the judge held that "quiet enjoyment" had nothing to do with noise, being rather more like a covenant for title, and it meant that the lessee should enjoy the premises without any interruption or interference in the possession of the same. In that sense the covenant had not been broken, and so there could be no injunction based upon that ground. Seeing, however, that the lessee had knowingly allowed Summers, his weekly tenant, to use the room for dancing and music after the plaintiff's complaint, he became a party to the nuisance, and so was liable in the same way as had been decided in the earlier case of "*Winter v. Baker*," above explained. The judge therefore held that the lessor, as well as the lessee, was liable for the nuisance, on the simple ground that he had become a party to the wrong-doing by knowingly permitting it to be done upon his premises. But under the circumstances, and the fact of the

plaintiff's long delay, he refused to grant an injunction, and he ended by giving the plaintiff £20 damages for the noise and the costs of the action upon that issue.

The second recent case to which we would refer is that of "*Fanshawe and others v. London and Provincial Dairy Co.*" (18th July, 1888). That was an action by the plaintiffs, as resident occupiers of houses in Halkin-street West, to restrain the defendants from carrying on the business of dairymen in that street in such a manner as to become a nuisance to their neighbours. The alleged nuisance consisted in the banging about of milk churns and cans upon the pavement and against each other late at night and in the early morning. It was proved, and could not be denied, that a good deal of noise was made; but the real issue was whether, under the circumstances, that was a nuisance with which the Court could interfere. Mr. Justice Kekewich quoting the ruling of an eminent judge in an earlier case to the effect that to constitute such a nuisance there must be "an inconvenience materially interfering with the ordinary comfort, physically, of human existence—not merely according to elegant or dainty modes and habits of living, but according to plain and sober and simple notions among the English people." If a man chooses to live in London he must put up with the usual noises incidental to carrying on business. It would not be a defence to say that the plaintiffs had come to the nuisance, for that theory could not be upheld nowadays. But they had elected to reside in a city of noises, and as long as their trading neighbours carried on trade in a reasonable way, they must put up with those noises. A large supply of milk was needed in London, and it could not be obtained without a good deal of noise. So this action was dismissed with costs.

#### LAND SURVEYING.—VII.

##### THE THEODOLITE AND PRISMATIC COMPASS.

IN taking an angle there are two methods that are in use. The first and most common method is to measure the angle between two objects or between two lines, irrespective of the meridian. The horizontal limb being level, unclamp the vernier plate and set the arrow of the vernier to  $360^\circ$ , or zero, carefully adjusting the same by the microscope and the adjusting screw. Clamp the instrument to the lower limb. Turn the instrument to the left of the two stations till the cross-wire of telescope cuts the pole or object. Fix it by the lower clamp screw, adjusting it to a nicety by the tangent screw. Unclamp the vernier plate and turn the telescope round till the wire cuts the second pole or object. Then, again clamp and adjust the vernier plate, and read off the angle by the vernier. To insure accuracy, read off the angle with the other vernier, and the mean or half sum of the two angles is the correct one. Repeat the operation if necessary.

The second method is to take the angle from the magnetic meridian line to the chain line. In this case, the zero of the vernier plate is set to the lower limb at  $360^\circ$  and clamped; the instrument is then moved round till the north end of needle points exactly to  $360^\circ$  in the box; fix it by the clamp screw. Loosen the clamp screw of upper plate, turn the telescope till the cross wires cut the object, then read the angle as before. Repeat the operation, and take the mean of the two readings. Care is necessary to take away all metallic objects from the neighbourhood of the instrument so as to avoid attraction, which would vitiate the results of the observation. We shall give an example of surveying on the meridian plan in our next article; in the mean time we may describe another very useful instrument used in surveying which has already been noticed—the prismatic compass. This

is a circular compass box with floating card attached to a magnetic needle, divided into quarter or half-degrees. On one side of the rim is the prism through which the surveyor looks, on the opposite side is a folding sight with wire. The vertical wire of this sight vane and the division on the card appear together on looking through the prism, and the coincidence of the wire and any particular division on the card denotes the bearing of the object the wire bisects, or the angle of line of sight with the direction of the needle. A mirror hinged to the sight vane, and sliding on it, can be placed at any angle for the purpose of reflecting any object

at a different level to the ground. There is also a spring for steadying the card before taking a reading. The instrument is held up horizontally before the eye of the observer, or fixed on a tripod stand. The prism is raised in its socket till the divisions on the card can be seen through it. Then turn the instrument round till the wire of sight cuts the object to be observed. Bring the needle to rest, and read the division of card coinciding with the sight wire, which will give the magnetic bearing of the object. The same operation can be repeated on another object, and the angle between them found. It must be observed that the figures on the compass card are reversed, so that they may be read right when seen through the prism which reverses them. The magnetic meridian makes an angle of  $20^\circ$  with the true meridian of London—the

is, the north of compass is now west of the true north. This angle varies at different places and times. The compass clinometer combines the prismatic compass and a clinometer for reading vertical angles, and is a useful modification. The manner of surveying and plotting with the compass we shall now describe. Let us suppose we have to take the survey of a road or valley between hills in which there are many bends such as we described, p. 166. We set our instruments up at the commencement of line 1 and 2 (Fig. 14), and observe the deflection of its direction from the magnetic meridian, having previously placed poles at each of the angles 1, 2, 3, 4, 5, 6, 7, 8, and 9. This reading 1 and 2 is  $40^{\circ} 30'$  north-east, which is put down; the measurement of the line is taken, and the instrument again set up on station 2, where the bearing of line 2 and 3 is in the contrary direction, the wire in the sight vane coinciding with  $45^{\circ} 15'$  north-west. This line being measured and the angle entered, the angle is next taken at station 3, the bearing being again reversed, reading  $48^{\circ}$  north-east. In a similar manner angles are taken at stations 4, 5, 6, 7, 8, and 9, the several readings of which are indicated in the diagram. For rapid surveying and for filling-in previous work in the field the compass is especially useful. The plotting is a repetition of the procedure in the field, only in this case a protractor is used instead of the compass. First we draw a vertical line to represent the magnetic meridian or north and south points. We begin at station 1. A circular protractor, preferably of cardboard, is placed over the station, the centres coinciding. The north or zero point is placed on the line through the station representing the meridian with the  $180^{\circ}$  over the line on the south. Fix or weight the protractor in this position, and prick off with a point 1 and 2 or the line  $40^{\circ} 30'$  north-east; 2 and 3 or the line  $45^{\circ} 15'$  north-west; 3 and 4 or the line  $48^{\circ}$  north-east; 4 and 5 or the line  $50^{\circ} 10'$  north-west. Taking up the protractor, straight lines are drawn through the centre as in the diagram. Next lay off the first line 1 and 2 by plotting its length from the field-book. Place the parallel ruler on the next line 2 and 3 and draw the next chain-line parallel thereto from point 2 and of its proper length. From 3 the parallel of 3 and 4 is drawn; from 4 that of 4 and 5, each being plotted to its length. At 5 the protractor may be again set and the lines of direction pricked off as before from the field-book; the repetition of this operation being necessary to avoid complication of lines in the first diagram. Hence we prick off the lines 5 and 6, 6 and 7, 7 and 8, 8 and 9, and afterwards draw lines parallel to each in order of their proper length, which completes the traverse.

The larger the protractor is made the more accurate the result will be: one a foot in diameter is not too large for an extensive survey drawn to a large scale; each quadrant may be divided by lines into 10 minutes. For great accuracy we should of course recommend the theodolite; but where the details of a survey are not numerous, and a large tract of country is gone over, the compass method of taking angles is to be preferred, as being more rapid and less irksome to the surveyor. The instrument is readily set up, there are no troublesome adjustments to make, and no back readings, as when the reverse has to be plotted with great nicety.

The way to use the theodolite in traversing is: ranging rods are put up at all the points in the former case. At station 2 the rod is taken out, and the instrument is set up exactly over the hole by spreading the legs out equally till the lower parallel plate is horizontal. The plumb bob is made to hang over the hole, from which the pole was withdrawn. The bearing 2-1 is taken with regard to the true north. Clamp the upper and lower plates together, and read the bear-

ing. Taking hold of the rim of lower plate, turn the instrument gently round till the telescope points to station. Clamp lower plate, and observe cross-hairs till they cut the pole by tangent screw. Release the upper plate, and turn instrument round to point 3, taking care to do it steadily, and not to overshoot the mark. Look through telescope, and bring hairs to coincide by clamping the upper plate and using the tangent screw, and read off bearing upon the same vernier. Unclamp the upper plate, and turning instrument again to pole 1, read again the bearing and repeat the operation towards 3, comparing the bearing in each case with the former one. If they agree, the observation is perfect; if the reading upon one of the stations differs from the first observation, the vernier must be set afresh and the observation taken again. When correct, the instrument is taken to station 3 and adjusted as before. Look to the bearing from station 2 and add  $180^{\circ}$  to it, and setting the plates, the operation is again repeated. Suppose, for example, the bearing 2 to 3 is  $45^{\circ} 15'$ , the opposite bearing 3-2 will be  $45^{\circ} 15' + 180^{\circ} = 225^{\circ} 15'$  to which the upper plate is set. In other words, if the original bearing is less than  $180^{\circ}$ , add that to it; if greater, subtract  $180^{\circ}$  from it. The same operation of checking back is required at every station, the plates being set to the back reading, clamping this upon the back rod and turning the instrument to the next forward station. By this method of proceeding each bearing or direction has a direct reference to the meridian; the lower plate being clamped or fixed, the upper plate revolves and measures the angle. Most surveys are made in relation to the magnetic north, the variation of the needle from the true north being laid down upon the plan. In our next we shall proceed to show other applications of the principle of the meridian system of surveying.

#### CARPENTRY AND JOINERY.\*

IT is intended under this heading to give a series of articles, which are the result of practical experience, and which, it is believed, will be of service to the apprentice, and it may be that the journeyman and others—perhaps even architects—may derive a few hints which will be of value.

One of the first calls upon the carpenter and joiner in the erection of a house after the ground has been "hoarded in," is "to lay a floor of joists." To begin with the basement, and taking notes as we go along from the "Quantities" now appearing in the BUILDING NEWS, by Mr. H. Lovegrove, it is to have joists 6in. by 2in. on sleepers 4½in. by 3in. These sleepers would be laid flatwise on dwarf walls, say, from 4ft. to 6ft. apart; the footings of walls would be used also, upon which to lay sleepers (see Fig. 1) where possible; these

joists would require no trimming; where hearths would occur a battery of brickwork would be built, upon which the hearthstone would be bedded, the joists reaching forward to the hearth in order to support flooring. The usual course adopted in regard to flooring in such a case is to encroach about 1in. each way on the space required for the hearth, lay the hearth on the flooring above where it is to remain, draw a line round it, remove the hearth, and with a saw cut to the line, and the hearth-

stone will drop in neatly when the mortar or cement bed has been prepared for it. The case of a hard-wood border being required round the hearth will be treated when the flooring is being written about. The other joists are specified in the quantities above spoken of, to be 10in. by 2½in., with "trimmer" 3½in. on wall plates 4½in. by 3in. The wall-plates will be laid flatwise, and as notching is specified in connection with these, it may be done as shown, two ways being diagrammed. The advantage of this is to tie the building more firmly together. The wall-plates require to be scarfed sometimes, if timber cannot be obtained of sufficient length, or, even if obtainable, it is

more convenient to use shorter lengths. Scarfing may be done as shown in Fig. 2. Sometimes, indeed, the scarf consists simply in halving and nailing, as shown in Fig. 3. The trimming consists in connecting together by mortise and tenon, or otherwise, the joists, so

as to leave a space where necessary for hearth-stone, stairs, or where light requires to be arranged for through a number of stories, also to avoid joists entering flues. Fig. 5 shows the methods adopted in their order of merit, as they are numbered 1, 2, 3. In the first case

the tenon may be one-sixth the depth of the joist, and in its centre, the tusk entering one-sixth the thickness of "trimmer." The tenon may be wedged or pinned as shown. Wedging and spiking will be necessary in most cases. A templet will be made to mark out the entering

joists, and to try in the "trimmer." A rough gauge will also be made to run on the trimmer for mortising and sinking, or housing the tusk. Square a line on the templet, as indicated by the dotted line on the diagram, which if the templet is tried in the trimmer will show when it is correctly wrought. A hint in regard to spacing joists, rafters, &c.: Place the outer two in position; now from the space between these deduct the number of joists or rafters to be put between, and divide the remainder by a

\* All rights reserved.

number equal to the number of joists or rafters so deducted plus one, which will give the space between each pair of rafters or joists; as, for example, the space between two joists is 13ft., deduct from this 2ft. 1in., or ten joists of 2½in., remainder 10ft. 11in., divided by 11, being one more than the number of joists gives 11½in. as the space between each pair of joists. This principle, when thoroughly understood, is capable of very wide application. In the second method of trimming, the tenon may be one-fifth the depth of the joist, or even the tenon may be square, that is, equal to the width of the joist each way; in this case 2½in., and housing may be ¾in., just to prevent the tenoned joist from warping. (Housing is the term used when one portion of the work is let into the other, when these parts make an angle with each other, as in the case in question, letting the tread and riser into the string or notch-board. Also in making door-cases the stile is sunk into the

FIG. 6

1/2 Scale

head, the object in most cases being to prevent warping, and in case of shrinkage to prevent the light showing through.) The tenon will be placed in the centre in this method also, and the "trimmer" will be spiked through into joists as well. In the third case, which is only adopted in inferior work, the joists are housed or sunk into the "trimmer" ¾in. or ¾in., and spiked through. An advantage would be gained by bevelling the sinking—that is, sink into the "trimmer" ¾in. on its upper edge and ¾in. on its lower, which, with any tendency to sinking on the part of the joist, would tighten it. Also, in putting in the joist, it thus taking the wedge form, could be put in tighter, and so the floor of joists would be more tightly braced together. When fixing the joists in position, they are side-spiked to the wall-plates with 3in. or 3½in. nails, and a strap or lath nailed along to the top edge near the ends of the joists, but clear of the wall, which prevents their being knocked out of place until the building has been carried up beyond them, when the strap may be sprung off. The joists are to have herring-bone strutting, or "bridging," as it is sometimes termed, the rows of which may be from 6ft. to 8ft. apart (see Fig. 6), according to length of joists. The

FIG. 7

1/2 Scale

only difficulty which may present itself in this will be getting the length and cut of each piece so as to fit exactly. If the joists were equally spaced, to set out on a board two joists in position, drawing lines to show position of struts, a templet made to that would serve to mark for cutting out the struts. But in practice it often occurs that the joists are not always equally spaced; so what is done is to draw a line across the joists where the strutting is to be, square down each side of the joists so as to have a guide for nailing the struts at the bottom edge of the joists. Now from the line which has been drawn across the

top edge of the joists mark off at each wall and on the joists a distance equal to the depth of the joist (in this case 10in.), and draw another line parallel to the first. The next step is: begin at one side of the room, take a piece of strutting, place it across two of the joists, being those nearest the wall, and guided by the lines drawn across the joists, place it in a similar position to what it would occupy when nailed up only at right angles, and with pencil in hand mark the piece of strutting underneath by running the pencil against the joist, and its point marking the strut at the same time. Leave the trace of the line on in cutting with the saw, and it is ready to nail up. Make with the peen of the hammer two dents at each end for the nails; now nail it in its place, taking care to nail it at the lower edge of the joist first. Fig. 7 explains getting the cuts.

In continuing, it must be observed that the struts must be nailed opposite each other at any given edge of the joist—that is, two struts abut against each other with the joists between. By this means the joists are kept from warping, and the floor of joists is tied together upon the principle of the lattice girder. It may be necessary if the joists have sagged (sunk) to lay pieces across underneath them and prop these pieces up until the joists are level; put in the strutting and remove pieces and props. If only one or two joists are sagged they may be levered up until the strutting is put in.

### PRACTICAL ARCHITECTURE WITH DETAILED ESTIMATES.—IX.

Carried to summary ...

## VENTILATION OF THE GUILDHALL, YORK.

IN consequence of the success attending the application of Messrs. Robert Boyle and Son's system of ventilation to the Council Chamber at the Guildhall, London, and other public buildings of a similar kind, it has been applied to the Council Chamber at the Guildhall, York, an ancient structure of considerable historical interest, the ventilation of which was very defective, though a number of air-inlets and open extraction shafts were provided, but which, as is usually the case with such rough-and-ready contrivances, had generally to be kept closed owing to the down-draught proceeding from them, rendering the ventilation practically nil, and semi-suffocation the natural consequence.

These defects have been entirely obviated since the application of Messrs. Boyle's system, consisting, in this instance, of two of the

latest improved patent self-acting air-pump ventilators, 30in. diameter, fixed upon the roof, and connected by means of 15in. dia. pipes, with two hoppers placed over perforated panels in the ceiling. This effectively provides for the extraction of the vitiated air, an ample supply of fresh air being admitted through seven of Messrs. Boyle's improved air-inlet tubes, 59in. by 10in. by 4 1/2 in., fixed against the walls in different parts of the chamber.

A valuable feature in this system is that it is perfectly under control, a matter of no small importance in the ventilation of a public building; and that it has proved successful in this, as in other instances where dependence was previously placed upon imperfect inlets and simple open pipes or flues, is evidenced by the following extract from a report received by Messrs. Boyle, with permission to use it, from Mr. E. G. Mawbey, the city surveyor of York, after lengthened experience of the system:—

"I have pleasure in informing you that the ventilation of this Council Chamber, which I have carried out on your system, is very satisfactory, notwithstanding that the room is altogether too small for the number of persons occupying it during council meetings."

This system is not only an efficient, but has the recommendation of being an economical one, and easily applied.

## CHIPS.

A new organ, built at a cost to the donors of £750 by Messrs. Willis and Son, of London, has this week been placed in St. John's Church, Preston, Lancs.

The new railway just made by the Great Western Company between Bodmin and Wade-bridge on the route of a disused mineral line was formally opened on Monday.

Mr. W. H. Smith, M.P., has agreed to formally open, on the 24th or 25th of October, the great South Gare breakwater at the mouth of the Tees, which virtually completes the improvements which the Tees Conservancy Commissioners have been constructing at the Tees mouth during the last 25 years.

The church of St. Olave, York, which has been closed for repairs, was reopened on Sunday. The work carried out consists of the taking down of the plaster ceiling, cleaning and exposing the moulded and panelled oak ceiling, and cleaning and repairing the whole of the walls, and exposing the dressed stonework. It has been executed by Messrs. J. and T. Biscoe, Mr. W. Dennison, and Mr. T. G. Hartley, under the direction and supervision of Messrs. Demaine and Brierley, architects. It is proposed next year to put new oak ceiling on the aisles, to further improve the nave roof, and to repair the glazing.

At the Carlisle Consistory Court last week a faculty was granted for the restoration of St. John's Church, Keswick, including additions to and re-roofing of the chancel, reseating, and the rebuilding of the pulpit.

The Art Gallery Committee of Manchester have purchased from the present Autumn Exhibition in that city the following three works for the Permanent Collection:—No. 371, "Autumn," by Mr. Alfred East, exhibited at the last Royal Academy; No. 375, "A Fair-haired Slave, who made himself a King," by Mr. C. N. Kennedy; and No. 376, "Britannia's Anchor," by Mr. David Murray, A.R.S.A.

The tower of the parish church of Long Compton, Warwickshire, is undergoing restoration. Mr. John Clarke, of Compton, is the contractor.

The free libraries at Salford were opened this week, for the first time, on a Sunday. The attendance of visitors and readers was very small at all four institutions.

New Wesleyan schools at Silloth, erected from the designs and under the superintendence of Mr. T. Tremble, were opened last week.

The church of St. Michael and All Angels, Queen's Town, Cape Colony, is about to be extended by the addition of north and south transepts with porch, and raising of central tower. The nave was erected in 1882 from a design selected in competition, and furnished by Mr. W. H. Reid, of Cape Town, from whose designs the present works will be carried out.

Major Du Cane, one of the Local Government Board Inspectors, held an inquiry at the Coffee Tavern, Maryport, on Tuesday week, with regard to an application made by the Cockermouth Rural Sanitary Authority to borrow £2,200 for the construction of sewage works at Ellenborough, Nether-ton, and Grasslot.

## OUR LITHOGRAPHIC ILLUSTRATIONS.

MODEL VILLAGE, AINTREE, NEAR LIVERPOOL. SELECTED DESIGN.

For description see page 324.

A CORNER IN THE STUDIO OF SEYMOUR LUCAS, A.R.A.

OUR illustration of this week represents the studio at "New Place," Woodchurch-road, West Hampstead, the residence of Mr. J. Seymour Lucas, A.R.A. The studio is on the ground floor of the house, and is 40ft. by 20ft. (exclusive of the bay window), and 15ft. in height. The room is oak panelled to a height of 8ft., and has a gallery at one end used for storing artistic properties. The panelling is partly old, and was made complete and the gallery formed with new work. The studio is hung round with armour, buff jerkins, swords, and arms, and contains a valuable collection of old costumes and furniture used by Mr. Lucas in painting his pictures. The ante drawing-room has a large bay window, similar in style to those at Haddon Hall, and in the dining-room is a fine terracotta chimney-piece of the time of William III. It is proposed to fix in the entrance to the house the doors, architraves, and hood removed from Fairfax House, Putney, illustrated in the BUILDING NEWS, June 29, 1888, and in Vol. XXXVII. page 548. There is a second studio on the upper floor of the house, used by Mrs. Seymour Lucas, whose pictures are well known. The house was built by Messrs. Mansbridge; but in any subsequent work, including the finishing of the studio, Messrs. Lee Brothers and Pain have acted as architects to Mr. Lucas.

PUBLIC BATHS AND WASHHOUSES, FOR THE VESTRY OF ST. GEORGE, HANOVER-SQUARE.—THE ACCEPTED DESIGN.

The elevation in Buckingham Palace-road is simple in treatment, the materials proposed being red bricks and Corsehill stone; that in Ecclestone-street is of the plainest character. The first-class baths and executive departments are arranged to front Buckingham Palace-road, and the second-class baths and washing departments are placed at the Ecclestone-street end of the site. Separate entrances are provided in each instance; these are so arranged that two pay boxes only are required. That in Ecclestone-street is, however, subdivided, so that it may be used as desired according to the pressure of work. The first-class swimming bath is 90ft. long by 30ft. wide, having a lantern roof; there are dressing boxes fitted up round the sides, with a gallery over; an attendant's room and necessary conveniences are provided. It is approached by a spacious hall and vestibule; the pay box is centrally placed. Adjoining to it is a waiting room and a committee room, for use at entertainments or at other times. From the hall a well-lighted staircase leads to the private baths on the first floor; these are twenty in number. The women's first-class baths are entered by a corresponding door to that on the men's side, and by a similar staircase also, they being on the first floor. The

board room, anteroom, and adjuncts are placed on this side of the building. The superintendent's apartments are placed on the second floor, and consist of six rooms, with the necessary conveniences. The first-class baths are lighted and ventilated by windows on one side, and by lantern lights over the back portion of the rooms; the staircases are lighted by similar lanterns, which also assist in lighting the vestibules. Pass doors are arranged for supervision, and also to render the second-class bath (swimming) available for the use of women. The men's department (second class) is entered by a vestibule with waiting room leading to the swimming bath, 57ft. long by 33ft. wide, also by a staircase to the private baths on the upper floor. The women's baths (second class) are approached by a staircase (adjoining the pay box) leading to the upper floor also. The public laundry is situated over the second-class baths and first-class swimming bath, and is provided with all the necessary appliances. There is a waiting room on the ground floor, with staircase and lift. The house, laundry, and engine room are placed above the ironing room, and over this is placed the large tank for supplying water and also fire hydrants, which will be fixed in convenient positions. The ventilation of this department will be assisted by the spaces between the shaft from boilers and the cylinder therein. There are four boilers in the basement, to be used as required, with engineer's shop, well lighted by pavement lights and glass roof over areas. Messrs. Lee and Smith are the architects.

## STOKESAY CASTLE, SHROPSHIRE.

THE uncommonly picturesque group of buildings, with its irregular polygon of a tower, known as Stokesay Castle, is with good reason a favourite subject for the sketcher and architectural student, while its connection with the Vernons of Haddon Hall, Derbyshire, of which we have lately given several illustrations, renders its history somewhat interesting. Otherwise, the records of the place do not specially call for remark. The De Ludlowes owned it before the Vernons, and then it passed to the Earls of Craven. To-day we give two sketches by Mr. T. Locke Worthington, A.R.I.B.A., taken by permission from his "Remnants of Old English Architecture," just published and printed for him by Messrs. Sprague and Co., of Cannon-street, E.C. Before glancing at this admirable brochure, it may be well to furnish a few particulars concerning the subject of the drawings shown herewith as samples from the volume they represent. Two other sketches in line of the same building are included in the folio, but the views we give are from coloured studies. At the Conquest, Stoke was held by Ældred of Eddic Sylvaticus, and after his rebellion it was bestowed on Roger de Montgomery. *Stokes*, which is the Anglo-Saxon for a village, is the word used in Domesday to describe the holding of Stokesay, and Walter de Laci is recorded as the owner. The derivation of its present appellation is taken from *Stokes* and *Say*, the family name of the possessors of the castle during the reign of Henry I. Theodric de Say gave the church adjoining his Castle to Haugmond Abbey in 1156. It is dedicated to St. John the Baptist, and is filled with old high-backed oak Jacobean pews, that in the chancel being a fine canopied structure; the building shows in Mr. Worthington's upper drawing. Laurence de Ludlow lived at Stokesay in 1281, and about 1290, the date on the plate, he obtained permission to encrenellate the buildings and to strengthen his fortress by walls of stone and lime. The present Manor House, no doubt, was his work, and consequent upon this license, he put up a strong embattled wall round the courtyard; but, save the garde-robe, this wall is now gone. Stokesay forms a delightful combination of half-house and half-castle, with moated entrance, gateway tower, great hall, and courtyard; indeed, Stokesay has been well described as one of the most complete and perfect examples in England of a castellated mansion of the 13th century, comprising, as it does, such excellent details of both wood and stone construction in great variety. The courtyard is an irregularly-shaped oblong inclosure, and is reached through a timber-built gatehouse elaborated with grotesque carvings and rich framings. On the west of this building is the house itself, having

two towers, one at the north end and the other at the south. The latter is the one seen in our lower sketch, and the other, surmounted by a 16th-century timber oversailing story, figures in the upper view, and it faces the churchyard. Lancet lights form the windows to the embattled tower, the openings to the lower floors being contrived obliquely, so as to prevent assailants from shooting their shafts inside the stronghold. The great hall measures about 52ft. by 31ft., and has a paved hearth in the centre. One of its four large windows, overlooking the moat, occurs in our upper picture. The roof is of good open-timber construction, resting on large upright stone corbels with Early English mouldings. In the principal rooms over the cellar in the north wing is a rich 16th-century fireplace of notable character. From its position Stokesay was evidently always regarded rather as a strong domestic residence than intended to be reckoned a serious fortress. During the Civil War it was, however, garrisoned for the king, but was speedily surrendered to the Parliamentarians after but a brief siege. We have given other illustrations of Stokesay Castle in the BUILDING NEWS for September 2, 1881, and March 27, 1885. Turning now briefly to the collection of plates which compose Mr. Worthington's "Remnants," we can but note the diverse character of the studies thus brought together, representing more or less nearly every period of work, chiefly exemplified by subjects existing in the West of England, with one or two bits from Kent, Yorkshire, and Lancashire. The concluding examples of the series are furnished by sketches from France. With a view to classify the material thus compiled, the plates are grouped under the heads of "Early Pointed or Lancet," the "Rectilinear Style," and the generic term of "Old English Picturesque Architecture," describes the remainder, with an epitome of the English Mediaeval styles by way of a preface; following which is printed the late Mr. Edmund Sharpe's table from the "Seven Periods of English Architecture." Wenlock Priory, Shropshire, is more thoroughly illustrated than any other subject, the best practical plate in the book being that showing a detail of the south transept of that beautiful ruin. The plan of the buildings is carefully done, and supplies a useful sheet; but the general elevations are, perhaps, a little too small for more than mere reference. The sketch of the combined columns from the octagonal fountain in the cloisters is indifferently drawn; but the detail study of the Early English foliations which enrich the chancel arcade in St. Mary's Church, Stone, Kent, are delineated with accuracy and appreciation of their beauty. Bolton Abbey and Peterborough Cathedral supply well-known doorways; and from the Mytton Chapel, Bredon Church, Worcestershire, some very useful studies of the beautiful windows there are given. A slight sketch from Pershore Abbey follows, and then comes a painstaking view of the celebrated florid oak stalls on the north side of Manchester Cathedral choir; from which church Mr. Worthington also gives us a sketch looking from the Derby Chapel into the retro-choir. Some of the misereres from the chancel stalls are carved with eminently grotesque subjects, in a few of which the fox and the goose, Reynard as a schoolmaster, or in the character of a reader, supplies a favourite source of ingenuity and fun. Chetham College dining-hall screens are drawn to scale; and the next plate is occupied by a general view of the central tower of Chester Cathedral from the cloister garth. A typical buttress in an outline sketch from Haddon Hall shows the class of work the author has studied; and the succeeding Ludlow sketchbook sheets illustrate equally familiar specimens of Domestic building from Shropshire, such as "The Feathers," and old houses in the "Bull Ring." Much Hall, Wenlock, and the "Old Vicarage," Prestbury, are instances, too, of the same class; while Harvington Manor, Worcestershire, is shown from a water-colour illustrating an unpretentious bit of timber building. The Norman staircase leading to the Registry, Canterbury Cathedral, an ancient friend often represented, and the north aisle of the choir at Cartmell, Lancashire, are interposed at this part of the volume, and then follow old houses of late date in Vine-street, Bristol, and in a by-lane, Gloucester. A sheet

of sketches from Evesham, Worcestershire, are autographic pocket-book studies in the streets of that ancient town, giving a view of the place from over the Avon, and another of the celebrated Bell Tower. The Market-place, Peterborough, and "Tom Tower," Christ Church, Oxford, are to a more useful scale, and the following sheet to nearly full size, illustrates a carved cap from Southwell Minster Chapter-house arcade. The trifles from Chartres and little bits from Laon and Senlis have the credit of being "drawn on the spot," a qualification, however, which seems to reflect upon some of the other and more serious drawings in the book, which may not (by mere chance perhaps) bear such credentials. The house in *Marché au Blé*, Reims, has a very nice front, suitably treated in vertical timberings richly detailed. The Tower of St. Vincent, Senlis, here shown by a tinted view, is a well-known *clocher* often imitated, and the accompanying drawing in outline of the western doorway of Senlis Cathedral is furnished in scale by two 14th-century figures borrowed from Mr. Lonsdale's "Book of Mediæval Costume." The last plate of the series is a general street view in Rouen on the north side of the cathedral, giving an admirable idea of the more ancient timber houses still to be seen unrestored in the old towns of Normandy. Mr. Worthington's "Remnants of Old Architecture" will add another to the several records of such buildings, and we have yet to learn that there can be too many of such representations of historical examples, for no one can deny their educational influence upon good taste and the pleasure of such souvenirs of the past and its remains.

#### BARFRESTON CHURCH, KENT.

THE proposed restoration of this very interesting church has, as our readers are already aware, caused no little controversy, and we understand that the Archbishop of Canterbury has taken some personal interest in the preservation of the building. The chancel was restored several years ago, and the present work is to be chiefly confined to the nave, the roof of which sadly needs repair. Whether the west wall is contemporary with the north and south walls seems open to question, and no doubt the Later window, which some wish to see removed, is an insertion which has destroyed the symmetrical design of the original west end. The correspondence which has appeared in our pages during the past few weeks has directed public attention to the question, and we can but further the matter by publishing these photographic illustrations, together with a ground plan of the church, which may be reckoned one of the most remarkable Norman buildings in England, calling to mind Ilfley Church, near Oxford; while its beautiful south door reminds one of the celebrated Prior's door at Ely Cathedral for the richness of its sculptures. Patrichbourne, in Kent, is said also to have closely resembled Barfreston, or Barson, as the "locals" call it. The stone with which the walls are built is described as Caen, filled in, of course, with rubble. The probable builder of the fabric was Hugh de Port, Constable of Dover. We know that the manor was given to him after Bishop Odo's disgrace in 1081. Good masons from Normandy had at that time been brought over by Archbishop Lanfranc, Prior Ernulf of Canterbury, and Bishop Gundulf of Rochester, and the Kentish lords, from the evidences remaining, readily found employment for their skill, while Barfreston Church may be taken as a notable example of their work. The singular treatment of the exterior façades has always been a fond subject for antiquarian dispute. The arches below the eastern end are certainly very curious, and seem to have been intended for a plan never quite realised. Some have thought the recesses thus formed by these arches were contrived to serve as burial places for the founder's family. All that is clear is that structurally they do not belong strictly to the wall of the building, being built on to it. Mr. J. P. Seddon is the architect engaged to restore the fabric.

#### 15, HYDE PARK MANSIONS.

THESE buildings are part of a series of similar West-end mansions erected recently in red brick, from the designs of Messrs. Eales and Son, architects, and the particular drawing herewith illustrated was exhibited at the Royal Academy this summer.

#### EXHIBITION OF WORKS IN WOOD.

AT the Carpenters' Hall a short time since there was held an exhibition, and amongst that was an Antique section. Mr. Seymour Lucas lent the interesting old Table with its secret hiding-place. We have seen in more than one of his pictures this table portrayed. The Jacobean Chair was lent by the same artist, and is an interesting example. There is a fine old Armchair from Old Lyon's Inn, and has a coat of arms painted on the top. The carved oak Bottle-holder is interesting. We do not recollect to have met with one of this description before; on releasing the little peg at the back the hinged back falls down, leaving room for the bottle to be inserted, whilst a good solid base precludes the idea of any upset. Mr. Shoppee had a good many oak Chairs on view. Carved ivory crucifixes and wonders in wood carving were included in an exhibition replete with interest, and which we hope to see enlarged on a future occasion.

#### HOME ARTS ASSOCIATION.

THE Home Arts Association annual show and sale of the year's work was on view a short time since at the Albert Hall, and was certainly not up to the standard usually attained, either in quantity or quality. We give a few sketches from articles shown there. The oak Settle was of good design well carved, with four enriched panels in the back, and shaped arms. The angle Cabinet we did not admire so much as some seen at the Association in previous years—it was in oak. The Bellows were also of oak, with a running carved pattern round them, finished off with brass nails and red leather. The Chair is evidently a copy, and very much like some in South Kensington Museum, the leather seat having been adapted from an old Cordovan example. The Ironwork came from Austria, and is to be used, we believe, as a pattern for students to work at. The little carved Frame is very pretty, both in execution and design; and the oak Cabinet, though somewhat Flemish in design, was more solidly put together and better finished off than the rubbish generally imported to this country. The classes at Ashridge, Windsor, and the linen industry from Langdale Valley were well represented. Some homespun Linen we saw had been worked by "Cherry Ripe" Pepper, the little girl whom Sir John Millais painted a few years back. The Pottery was rather better than usual; there were a few very good Barbotine examples from Devonshire. The Repoussé Brasswork was fairly good, and we hope next year the woodwork and carving will have improved, and a better exhibition be the result.

#### CHIPS.

At a meeting held at Garrigill, near Alston, Cumberland, last week, it was decided to take steps to restore and enlarge the ancient chapel-of-ease, in accordance with plans prepared by Mr. W. Hicks, of Newcastle-on-Tyne, the estimated outlay being £1,000.

Some beautiful carving in clunch stone has been discovered in a buttress against the north-east corner of the north transept of Peterborough Cathedral, which doubtless belonged to the Lady chapel, built in 1272 by Prior Pavys and demolished in 1670 to mend the dilapidations in other parts of the building. It consists of arcading, crocketed pinnacles, caps, mouldings, &c., and formed a portion of internal ornamentation. Many stones bear traces of very brilliant pigments. According to the chapter records, Lovin built the buttress in 1698, or 28 years after the destruction of the Lady chapel.

In accordance with a resolution passed at a meeting of the brick trade, held recently at the Cannon-street Hotel, steps are being taken to advance the price of bricks by 20 per cent. The advance is desired for the purpose of covering "the loss from waste and short make caused through the wet season."

The Board of Trade inspection of the Oxted and Groombridge Line took place on Thursday in last week, the inspector being Major-General Hutchinson, C.E., who was accompanied by Mr. F. D. Bannister, the engineer, and Mr. J. T. Firbank, of the firm of Firbank Brothers, the contractors. The inspection commenced at Edenbridge, and was continued through Hever, Cowden, and Hartfield stations on to Groombridge. The new line will be opened about the first week in October.

#### COMPETITIONS.

EDINBURGH.—Archbishop Strain has selected for the Roman Catholic Church proposed to be built in Upper Gray-street the competitive plans submitted by Mr. Rhoderic Cameron, 130, George-street, Edinburgh. The style of architecture adopted is a free treatment of Classic Renaissance. The front façade towards Upper Gray-street shows base and middle stories marked by cornices, and surmounted by a pedimented gable. The basement is of polished and moulded ashlar; the upper portions will be of scabbled work. The large west window, which is semicircular in form, is mullioned, and has a moulded sill and architrave. The gable will have a deep frieze and a moulded cornice and pediment, finished with a plain Latin cross. The tympanum of the gable is intended to have a sculptured subject from the Life of Christ in bas-relievo. The plan of the church is an oblong, with semicircular end, forming a chancel and nave, and having a broad passage running up the middle, and an organ gallery over the vestibule. The organ gallery is approached by a stone staircase from the main entrance. In the north-east angle are the sacristy, acolytes' room, and lavatory. In the basement of this block is the heating-chamber. The font will be in the vestibule at the west end. The confessionals at the south side will be divided into closets for priests and penitents, and will have separate entrances from sacristy and church. The area of the church will be seated with pews. The roof of the church is an open-timber one, having the principals, purlins, and rafters exposed. The inside face of the walls—which is divided into bays by pilasters carrying the roof principals—is to be finished in plain plaster. It is, however, intended to decorate it with Scriptural subjects in fresco painting, when finances permit of that being done. The church will accommodate 540 people.

#### ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

LINDISFARNE PRIORY.—The members of the Newcastle Society of Antiquaries, of the Durham and Northumberland Archæological Society, and of the Berwickshire Field Club held a joint meeting at Bamburgh and Belford on Thursday, and on Holy Island on Friday. Sir William Crossman, the lord of the manor, received the visitors within the ruins of Lindisfarne Priory, and explained to the party the excavations and repairs carried out under the direction of Mr. Johnson, of Newcastle, as architect to the Commissioners of Woods and Forests. An address on the historical and religious associations of the island was afterwards given by Canon Greenwell, and Mr. C. C. Hodges, of Hexham, afterwards gave the architectural history of the church. The evidence showed, he said, that there was a stone church before the present church was begun, and part of that Saxon stone church was still to be seen. He pointed to places where the lower masonry was in irregular blocks, differing from the blocks of stone of above, which were square. This masonry, too, was carried below the level of the Norman church, and was covered with plaster, which was a Saxon and not a Norman custom. The church in which they now stood was built by Edward the Monk, and it remained unaltered until the time of the Dissolution of the monasteries. They had there what they had not in the whole of England—a monastic church of the Norman period of which they could say that the whole of the ground plan remained unaltered. The church followed the outlines of the Cathedral of Durham—being a later adaptation of the same style. From the time of the Dissolution until 1664 it was, he said, used as a storehouse by the Government. In 1728, from a cut which was published at that time, there was much more of it standing than there was now. In 1840, extensive repairs were undertaken by the Commissioners of Woods and Forests.

The Nurses' Home recently erected in connection with the Glasgow Royal Infirmary, at a cost of over £8,000, was formally opened on Friday. It is situated to the east of the main block of the institution, and is four stories in height, containing a large recreation hall and other public apartments as well as 85 bed-rooms.

## WAYSIDE NOTES.

WHAT do you consider to be the architectural topic of the hour?" I somewhat despairingly asked a friend a few days ago. "Water-frolics and rambles by the seaside," quoth he. Perhaps he was right. Even up to this date there is wonderfully little moving; to employ a technical term of unfortunate elderly assistants who call periodically upon one. I suppose most architects are it of town. Being prevented from taking a lengthy holiday myself, I notice the absence of movement in the magic architectural circle. I hope that all who have been away have had—and that all who are away are having—a good time; and I trust that some few will commiserate with the ancient Goth, whose chance of enjoying an autumnal Continental tour has, or some weeks past, been growing "smaller y degrees and beautifully less," till now it has apparently vanished altogether.

As regards topics of a class more in order than water-frolics and rambles by the seaside, there is certainly a lack of anything of great interest. One can only hope that the duller part of the season has been reached, and that henceforth there will be an increasing quantity of matter to be discussed. When the various earned architectural bodies reassemble the times will be more lively. Meanwhile, as touching the doings of these bodies, I will express a regret that the Society of Architects should have been compelled to put off until next year that which should have been accomplished in the present one; and will rejoice that the Architectural Association excursion has been made in triumph, and that a party of members are now ready to join in the visit to Hatfield House fixed for to-morrow, where they will see much that is exceedingly interesting and beautiful, besides some admirable electric lighting arrangements. I have the above facts on my list, upon which, also, I see "New Railways" noted down. I suppose in reference to a few unimportant branch lines just opened. There is not much to be said about them, except to regret, with the rising generation of C.E.'s, that so little railway work is wanted in this country; but it reminds me that, having had to pay a flying visit to Bournemouth a few days back, I have had an opportunity to inspect the permanent way of the new "direct route."

The line runs through some pretty country, and what one can see of the New Forest is very beautiful, even if it does not bear comparison with the wilder scenery of the more solitary depths of the great Conqueror's hunting-ground. Yet on Saturday last I had many an enchanting glimpse of close forest glades and of open chases, with a middle distance of thick foliage, backed by a sea of tree-tops extending into the blue distance, and with a foreground of common-like country, purple with luxuriant heather and bright with patches of autumnal grasses, of every tint of warm brown and orange. The line itself appears to be an excellent piece of engineering. It is prim enough now, certainly, with its brand new iron and bright red-brick bridges, although rank vegetation has pretty well covered the slopes of embankments, except where these features are scored with chalk drains, in parallel rows, which abut on dwarf retaining walls of concrete, with earthenware pipe-drains, or of local stone placed in position without any cementing material, so that the water may percolate through the joints. Travelling is smooth over the metals, even at a considerable pace; for, although the S.W.R. is hardly likely to beat the recently-established record of ninety miles in ninety minutes, its speed is gradually improving, the new express engines of Messrs. Robert Stephenson and Co.'s manufacture showing that the old firm maintain a high standard of workmanship.

The Hôtel Mont Dore will shortly be lighted throughout by electricity. The building is "wired," and the clips for the incandescent lamps are fixed in pretty pendants and chandeliers. Further improvements are being made at the Mont Dore; a winter garden and covered tennis-court are being constructed, in a pavilion style, above the flat roof of the elaborate baths.

I rather imagine that Bournemouth will go ahead now that the new line places it within easy reach of the metropolis. If only the South-Western Railway Company could be induced to still further accelerate the service to the town—and they could run to the fine new station at Bournemouth East in two and a half hours, or under—there would be a considerable increase in business, and the Bournemouth architects would be busy. I don't want Mr. B. to hear of this, as there appears to be a happy absence of reckless jerry-building in the beautiful town surrounded by a belt of murmuring pines.

In the matter of electric lighting, I see that the inhabitants of Barnet have had the good sense to adopt the light. The town is now illuminated by seventy-one lamps. "Where the wires cross main thoroughfares they are laid underground in creosoted wooden troughs, and are insulated with rubber and incased in lead tubes to protect them from mechanical injury." At the works of the company that is lighting the streets of Barnet additional plant are being put down for supplying from 1,000 to 5,000 lamps for use in private houses, churches, &c., there will be a lot of private buildings supplied with the electric light this winter.

I have a note of a discovery made at Margate. A paragraph in the dailies at the beginning of the week stated that a man was engaged in digging a hole in a field adjoining Trinity Church, when his pickaxe suddenly penetrated a cavity and fell from his hand, he himself having but just time to move before the earth gave way and disclosed a large subterranean chamber about 12ft. in height. A number of human and other remains were found, and a long underground passage "probably connecting the chamber with the seashore." The construction of the large chamber has not been described, and it may be merely an excavation in the chalk. It is hardly likely to be another mysterious place like the "Grotto" at Margate, which ninety-nine persons out of a hundred pass by as an ordinary, made-up modern show place, whereas it is nothing of the sort, but a most curious little arrangement of subterranean chambers, elaborately inlaid with shells and other marine objects, affixed to the hard chalk with a most tenacious cement. This grotto can only be a hundred yards or so from the newly-discovered cave. Curiously enough, both places were found in the same way—by men digging or picking at the earth, and suddenly finding their spade and pick disappear. Although I had a long time back been told by an architect that the grotto was well worth a visit, it was only last June that I took an opportunity to see it. As to its origin I cannot even hazard a guess.

Dover is to have a promenade pier. On August 30th a meeting was held at the town to consider the advisability of erecting the pier, and as the assembled townsfolk were strongly in favour of the proposal, it is to be concluded that steps will be at once taken to provide the structure. Dover evidently is not to be outdone in the matter of piers by Folkestone. The new pier at the latter place, which I had an opportunity to visit a few weeks back, has a rather heavy-looking pavilion on the broad platform at the end, after the nature of the one at Hastings. The proposed Dover pier will be similarly provided with a pavilion. Music halls, pure and simple, are what these pavilions become, and it is curious to note that vast numbers of persons who would scout the idea of entering a music-hall on land, make no scruple when the building is supported on a few iron piles and juttied out into the sea.

That the result of the Clapham Public Library competition should have given rise to much angry discussion, does not surprise me much. For the committee to adopt a scheme that will cost more than was originally contemplated, and to calmly endeavour to pension off the competitor whose plans, I understand, most nearly solved the problem, is a circumstance calculated to arouse the ire of others besides those directly concerned in the result of the competition. Even if, as "Abuker" said in the *Echo*, many false charges are brought against the committee, the fact remains that they have overridden the most important condition—namely, that of

cost. Had the amount offered to Mr. J. J. Jones been sufficient to remunerate him for the plans little would have been said. A ten-pound note is to be looked after in these times, but under the circumstances it was a beggarly sum. If I rightly understand the facts of the case, the whole affair is disgraceful. Although I lately spoke of the difficulty of providing a fixed sum in competitions, the system of limiting the expenditure must be rigidly adhered to, if even a small percentage of competitions are to be brought to a satisfactory termination. Expenditure, we know, has little or nothing to do with true architectural effect; but it has all to the world to do with the provision of bare accommodation—and, therefore, with a few additional hundreds of pounds it is an easy matter to outstrip one's fellow competitors.

It is just as I half-guessed last week. Mr. Albert Hartshorne's impassioned appeal to the *Athenæum* against the "shocking treatment" of the oak panelling in the Long Gallery at Haddon Hall, and his prayers to the Duke of Rutland "to order the instant arrest of the vandal hand" which was working such "dire mischief," is a case of the boy and the wolf. The "Vandal" turns out to be Mr. F. J. Furnival, who roundly characterises Mr. Albert Hartshorne's letter as an astounding specimen of ignorance. The panelling, Mr. Furnival explains, is of oak, but is now covered by faded brown paint put on a hundred years ago and intended to represent a cross between chestnut and walnut. This paint, by the Duke of Rutland's authority, he oiled on a few panels and then scraped it off, revealing the fine, rich brown oak underneath. The Duke has promised that the oak shall be cleaned from this coating and restored, and, no doubt, will bestow on Mr. Hartshorne the "tender graces" of the scraped-off paint which the would-be critic so much admires. Mr. Furnival calls on Mr. Hartshorne to offer an apology for his glaring attempt to justify a shameful outrage on taste and on antiquity, and concludes, "How true it is that you can never begin to remove an abuse without being denounced by the ignorant and the prejudiced sentimental lovers of quasi-modern shams!" I wonder what the apology will be like—Hartshorne and sweet oil? Let's hope the unguent, and not the irritant, will prevail this time. GOTH.

## CHIPS.

A new reredos is about to be placed in Cross-thwaite Church as a memorial to the late Miss Rorke, and at the same time the floor of the church will be raised two steps in height and paved with mosaic marble. Mr. C. J. Ferguson, of Carlisle, is the architect, and the outlay will be about £600.

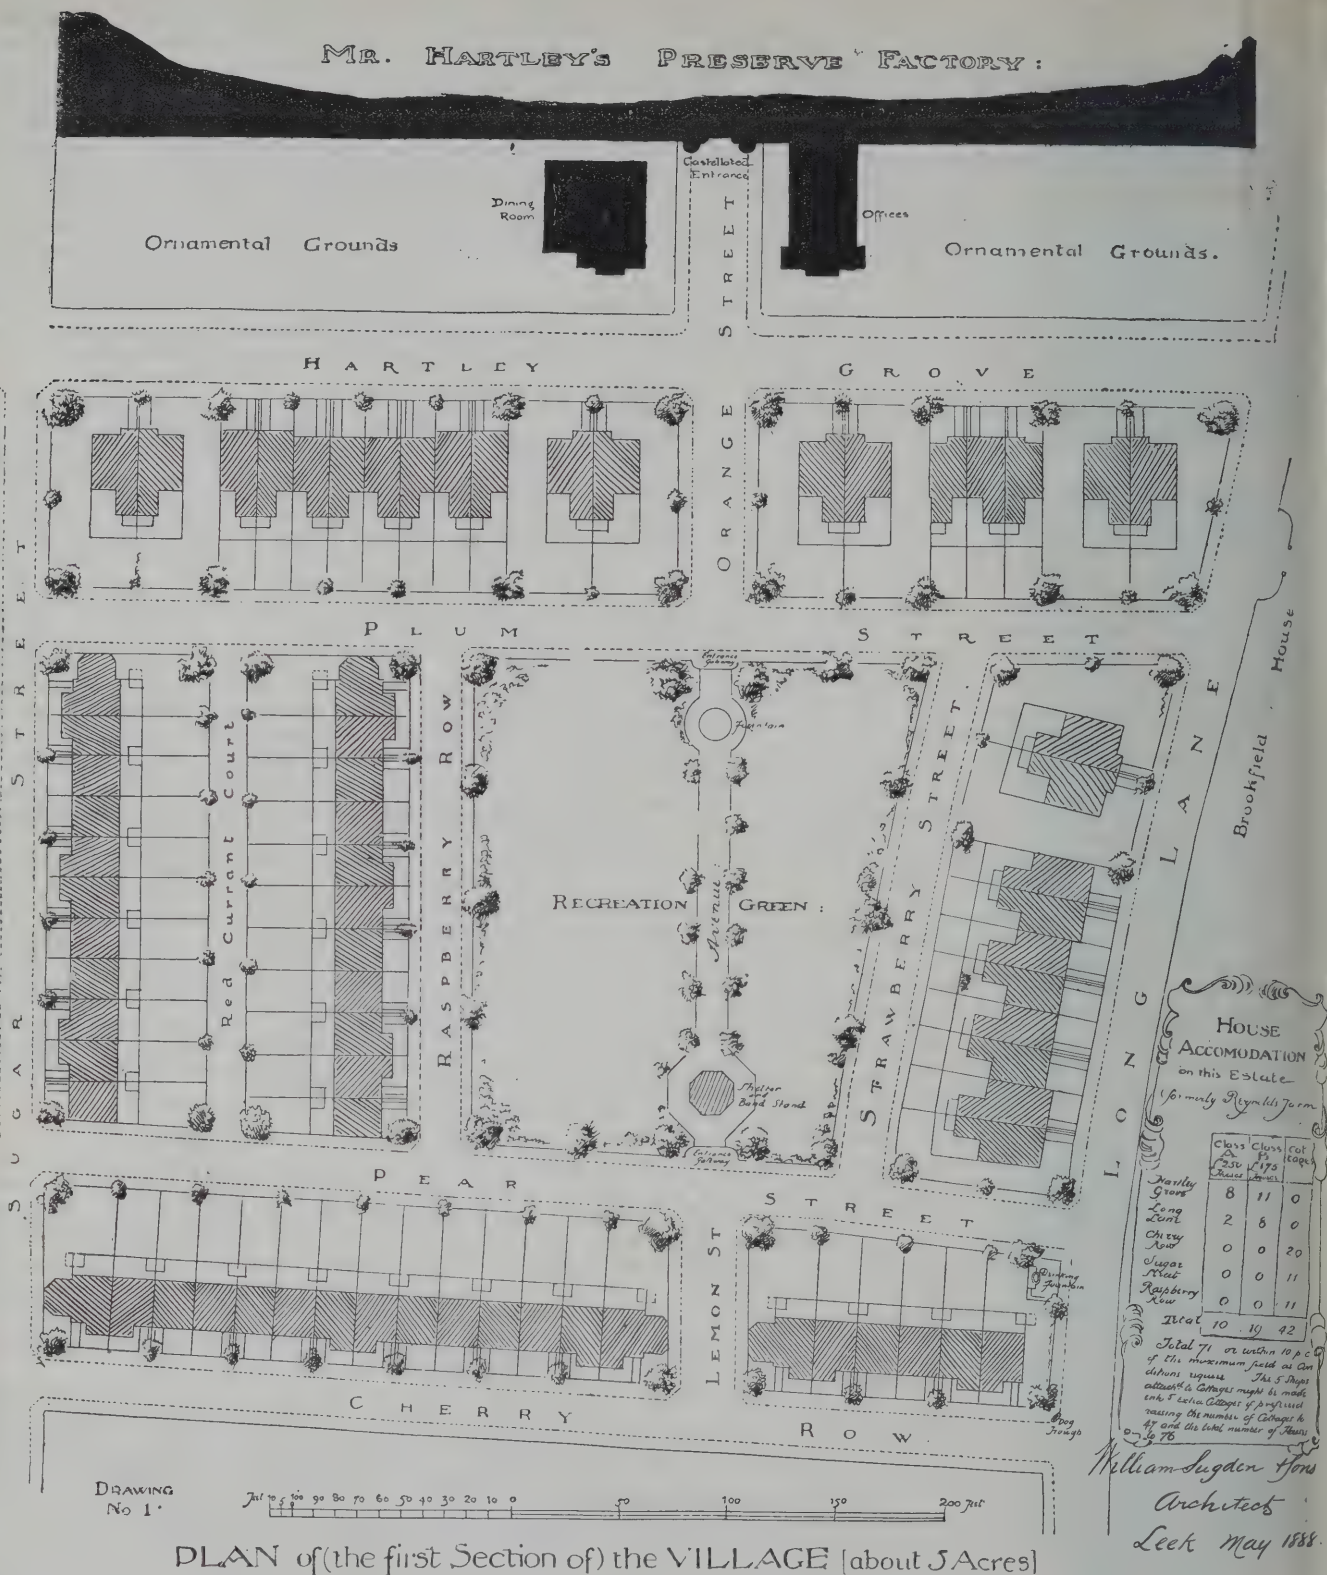

Various works of restoration have just been carried out at the parish church, West Bromwich, from plans by Messrs. Wood and Kendrick, of that town. The builder was Mr. William Bennett, of Lozells, Birmingham.

The new branch line which has for some time past been in course of construction to Greenwich by the London, Chatham, and Dover Company was to have been opened on Monday, but it is postponed for a fortnight. It commences at the company's Blackheath-hill Station, and terminates at Stockwell-street, Greenwich, and within about two hundred yards of Greenwich Park. The line, which is little more than half a mile in length, is constructed throughout in a cutting from 20ft. to 25ft. deep, the retaining walls being faced with concrete the entire length. The line passes under eight streets. The works have been carried out under the supervision of Mr. R. Barker, the company's resident engineer, Messrs. Lucas and Aird being the contractors.

Colonel W. M. Ducat, R.E., an inspector of the Local Government Board, held at inquiry at the Town-hall, Tunstall, on Friday, into an application by the local board of health for sanction to borrow the sum of £5,000, for the erection of baths and wash-houses, a fire-engine station, stables, and town yard. Mr. A. R. Wood, surveyor to the board, exhibited and explained the plans.

Mr. Joshua W. Butterworth, F.S.A., vice-president of the London and Middlesex Archaeological Society, proposes to commemorate the visit of the society to Edmonton Church on July 26th last by the erection of a monument in the church to the memory of Charles Lamb and William Cowper, the poets. Mr. James Forsyth, sculptor, of Finchley-road, has been commissioned to execute the work, from a design of Mr. Thomas Milbourn, architect, hon. sec. of the society.

### MODEL VILLAGE AT AINTREE, NEAR LIVERPOOL: SELECTED DESIGN.

[WITH PHOTOLITHOGRAPHIC ILLUSTRATIONS]

WE print to-day plans and elevations of the houses to be built by Mr. Hartley for his workpeople on a site known as "Reynolds's Farm," adjoining his factories, in accordance with designs obtained in a competition recently held. Messrs. Wm. Sugden and Sons, of Leek, are the authors of the premiated plans, and those by Mr. Frank W. Mee were placed second. The block plan accompanying the detail drawings herewith published furnishes particulars of the house accommodation, showing also how the recreation-ground is laid out and the streets arranged.

The County Mayo lunatic asylum at Castlebar is about to be enlarged at a cost of £5,000, from plans prepared by Mr. Glover, C.E.

### MASONRY AND STONE-CUTTING.

By LAWRENCE HARVEY.

FIFTEENTH LESSON.

WHEN a groin is formed by the intersection of two vaults crossing one another, the vault cannot stand before it is completely built; but when the vaults form a coved ceiling, as in Fig. 86, the structure can be stopped at any level on condition that the last course of stones be constructed in form of a straight arch, as shown in our drawing, to prevent the several stones of the course slipping down inside. This precaution is not required for the courses below, as the pressure of the courses above prevents the stones slipping.

Any number of vaults may, as in Fig. 87, meet round an irregular polygon, and if they are all of elliptical section springing from the same level, and rising to the same height at the crown, the plans of the groins formed by their

intersections will be straight lines. In Fig. 87 four vaults meet around the polygon ABCD the smaller vault is semicircular, the others are elliptical. In a central position we select a point O, which in this case we have taken at the intersection of the lines VY and XZ which connect the centres of the opposite sides of the quadrilateral. Now, suppose four ellipses, all having their minor axes equal to OX, and their major axes on AB, BC, CD, DA respectively; the four vaults of which the above ellipses are the guiding lines, and of which the generators are parallel to the lines XZ and VY, will intersect one another along groins straight on plan, such as OA, OB, OC, OD. As the centre line OX of the cylindrical vault from O to X is not in the direction of the centre line XO' of the semicircular arch, there will be a groin formed above the line AB similar to the groin at the return angle of a cloister; that is, it will form

## Building Intelligence.

**COLESHILL.**—The spire of the church of SS. Peter and Paul, Coleshill, like those of several of the contemporary churches of Warwickshire, has during the last few years shown evidences of decay. It was, therefore, truncated to within a few feet of the supporting tower, and the work of rebuilding has been undertaken. The nave and chancel were restored in an admirable spirit in 1859, the total cost of the work, amounting to £12,000, being defrayed by the Digby family, who are the proprietors of the chancel; a clock, Communion plate, and an organ being at the same time provided by the parishioners, at a cost of £530. The foundation of the church dates from pre-Norman, but the edifice is chiefly of the Decorated and Perpendicular styles. The church contains monuments of the De Clintons and of several members of the Digby family. The crocketed spire, though lowered 15ft. in consequence of injury sustained by lightning in 1550, was visible for many miles round. It was restored some years ago; but the sandstone used was of a soft and crumbling nature, and the present rebuilding is absolutely necessary for the safety of the rest of the church. The cost of the work is estimated at £1,700.

**DARLINGTON.**—The new church of St. Hilda, Darlington, was opened on the 30th ult. It has been designed by Mr. J. L. Pearson, R.A., and is Early English in style. The walls are of red brick, with stone dressings. Stone is also used for the pillars, capitals, and the voussoirs of the arches dividing the chancel from the morning chapel on the north and the organ-chamber on the south. The shafts of the piers supporting the pillars are alternately octagonal and circular, and the bases and capitals are moulded. The roof is an open one of pitch-pine, with tie-beams. The west window consists of three lofty lancets, divided by wide piers of red brick; but the east window, of cathedral glass, has facings and piers of stone. The altar is of oak, and the pulpit of Leeds stone. The floor of the church is of wooden blocks and Staffordshire tiles, and cathedral chairs will, for the present, afford accommodation for 560 worshippers.

**GATESHEAD.**—New schools at the Teams, built for the Gateshead School Board, were opened last week. The building consists of three blocks. On the ground floor of the entrance block are the masters' and teachers' rooms, hat and cloak-room, and lavatories for the boys. On the next floor the same arrangements are provided for the girls. On the floor above the whole area forms a room for cooking lessons, &c. The block immediately behind, connected by corridors, is a school and classroom for boys and girls. The third block comprises the infants' department, and is one story high. The walls are built of brick with stone stringing. The work has been carried out by Messrs. Haswell and Waugh, Gateshead. Mr. W. H. Dunn, of the firm of Thompson and Dunn, Newcastle, was the architect, Mr. Wm. Edlington acting as clerk of works.

**NOTTINGHAM.**—The new block of municipal buildings, to be called the Guildhall, erected on the site of the old cattle-market, abutting on to Burton, Sherwood, and Shakespeare-streets, and in the immediate vicinity of University College, has just been completed. The old town hall, a small, unsightly structure in Weekday-cross, had long been found inadequate, and six years ago premiums of £300, £200, and £100 were offered for the three best designs for new buildings. As many as 117 designs were sent in, and Mr. A. Waterhouse, R.A., the assessor, recommended that the first and second prizes should be divided between Messrs. Verity and Hunt, of Regent-street, London, and Mr. F. H. Oldham, of Manchester, their designs being considered of equal merit, and at the same time he suggested that the plans of Messrs. Verity and Hunt should be accepted, as being best adapted for the purposes required. After Messrs. Verity and Hunt had altered their plans in accordance with the modified requirements of the corporation, the tender of Mr. Edmund Gabbutt, of Liverpool, was accepted for the erection of the building, the amount of his contract being £61,700. The

a projecting arris from A to X, and a valley from X to B. The same applies to the groin lines on BC, CD, DA, formed by the other vaults. The joints of the several vaults comprised in this structure must be normal to the soffit of the vaults. We shall begin by drawing the jointing on the semicircular section A'X'B' of the smaller vault, and the joint lines are then carried all round the other vaults at the same level. Then we draw the right section of the cylinder of centre line OX; this is an ellipse of which the axes are Ax and xx' = O'X'. On this section we mark the divisions of the joints, and draw the joints normal to the ellipse; the planes of the bed-joints are completely determined by the joints on section and by the joints on plan. The intersections of the beds and the bed moulds will then be found by the same methods we have used for the return angle of a cloister.

In Fig. 88 we have groins formed by the meeting of six barrel vaults, in which a splay has been provided to cut off the sharp angles which otherwise would exist between each vault. The splay AB<sub>2</sub> is made to be the side of a cylindrical vault of elliptical section, which rises from AB<sub>2</sub> to its crown in O; the intersection of this vault by the two neighbouring barrel vaults A'Z<sub>2</sub>B<sub>2</sub> and A'Z'B' gives two groin lines which meet in O. Thus, every barrel vault is separated from its neighbour by double groin lines, which comprise a piece of cylindrical surface. Everything that has been said about the jointing in other cases of

groining applies to this; but it must be noticed that one stone must comprise the figure CDNN<sub>2</sub>FEM<sub>2</sub>MC, so that this stone has three cylindrical soffits. The working of the stone is done by any of the methods used before in the return angle of cloister. The keystone (Fig. 89) is cut as that of any ordinary groined vault, beginning by producing an hexagonal prism, on the faces of which the head moulds are placed.

In Fig. 90 we have double groins which diverge from the point of springing so as to form on plan the figure of a star. To produce this, a parallelogram VXYZ is first drawn with sides parallel to the diagonals AC, BD. Then the groins are made to meet two by two at the points VXYZ. The triangular spaces between the groins are filled by cylindrical vaults of elliptical section, starting from the angles of the walls, such as A, and rising to the same level as the barrel vaults at their crown VX. The parallelogram VXYZ is formed of a flat arch, or, if small enough, by one stone, which may be decorated as a pendant keystone. The diagonal section of the vault is shown on Fig. 91, by which it will be seen that the voussoirs around the keystone have soffits partly flat, partly cylindrical. The outline KRPQSTUWSK comprises the soffit of one stone, and EFNPGHLM that of another. The jointing is done in the same way as for the other groin vaults, and so is the working of the stones, which we need not, therefore, describe again.

Guildhall is of stone, the style being the French Renaissance. The mayor will open the buildings on the 20th inst.

### CHIPS.

The Church of St. Mary de Wyche, at the junction of Over-street and Wychbold and Stoke Works-roads, Droitwich, was opened on Friday by the Bishop of Worcester. The church is in the Late Decorated style, and is built of Malvern Hill stone, with Broomsgrove stone dressings, and lined internally with red brick. Sittings are provided for 348 persons. The east window is filled with stained glass, in memory of the late Sir R. P. Amplett. The tower, which is in course of erection, is the gift of Mr. J. Corbett, M.P. It will be 60ft. high, and will hold a peal of six bells. The church has been erected from the designs of Mr. L. Sheppard, of Worcester.

A new mission-room at Halton, near Whitkirk, which has been erected at a cost of £200, was dedicated on Friday by the Bishop of Penrith. The building, which is of red brick, is of a substantial character, and has accommodation for 150 persons. The work has been carried out by Messrs. Tomlinson, builders, Leeds.

The town council of Middlesbrough have decided to ask the Prince of Wales to open, in December next, the new municipal buildings now in course of erection from plans by Mr. G. G. Hoskins, of Darlington.

Good progress is being made with the erection of the new public markets for Carlisle, from designs by Messrs. Causton and Graham, of London, which were selected in competition two years since. The style is Composite. The external work is of red sandstone, from a quarry at Aspatria reopened for the purpose, the dressings being of Haydon stone. Messrs. H. and R. H. Hodgson, of Workington, are the contractors for masonry and builder's work, and the contract for the roof, for which Mr. Walmisley is the engineer, has recently been let to Messrs. Conway, Sheldon, and Co., the fireproof flooring being undertaken by Messrs. Lindsay, of London. Mr. R. Nelson is executing the carving.

Fourteen bronze medals have been awarded by the Council of the Society of Arts, on the recommendation of the judges, to exhibitors at the recent Exhibition of Home Industries, held at the Crystal Palace by the Co-operative Union. The names include: in metal-work art, J. R. Stebbings, for specimens of chasing and embossing; in cabinet-making, Charles Cartwright, for brown oak sideboard; in house decorating, James Edwards, for six decorated panels; and in carving, L. J. Perrin, for specimens of wood-carving.

A brass lectern has just been placed in Carmarthen parish church representing a full-size angel bearing on its uplifted arms the Gospel to the four quarters of the earth, which latter is symbolised by the domical base, with its four pinnacles and foliage-embellished buttresses, separated by elaborately sectioned panels of tracery work. The book-rest is richly engraved and pierced. The style of the lectern is of the Perpendicular Gothic period. The work has been carried out by the well-known firm of Jones and Willis, of London and Birmingham.

Mr. Robert Dymond, J.P., F.S.A., died on Friday at his country residence, Blackslade, Widecombe-in-the-Moor. The deceased, with his brother, carried on an extensive business as land agents and surveyors. He was a well-known writer on antiquarian subjects, and secretary of the committee appointed by the Devonshire Association to report on works of art in Devon. He was also a regular contributor of papers to the Devonshire Association for the Advancement of Science and Art. Among his publications may be mentioned "Heraldic Discoveries in Exeter Cathedral." The deceased was 64 years of age.

On Friday, Colonel Rich, as inspector of the Board of Trade, made an inspection of the new double line of rails from the colliery bridge signal cabin, at Rhosddu, into the central station at Wrexham. He was accompanied on his inspection by Mr. Robert Piercy, C.E., Mr. William Davies, C.E., Mr. J. Wooley, contractor for the line, and Mr. Dutton (McKenzie and Holland, signal engineers). The line, which is a section of the Wrexham and Connah's Quay undertaking, has since been opened.

Mr. Justice Denman has dismissed the appeal brought by Mr. Robertson against the refusal by the master of his application for judgment under order 14 against the Metropolitan Board of Works for £86, arrears of the salary alleged to be due from the Board to him, mainly on the ground that there was a question to be tried between the parties, the defendants having alleged that the plaintiff had received certain moneys in fraud of the Board (which was denied).

### TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

### TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 80c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.). To India (via Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

### ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 6s.

### SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

### NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLII., XLVI., XLIX., L., LI., LII., LIII., and LIV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—N. H. L. Bd.—M. Bros. and Co.—P. G.—C. and Co.—W. and R. L.—G. W. T.—W. R. N.—H. L.—F. W. H.

J. R. T. (Yes; Jeffrey and Co. or Woollams and Co. See advertisements for addresses. Don't waste money on the other barbarous abortions you mention.)—MEN-THOL. (Ewart and Sons is by far the best—the other affair is very unsatisfactory.)—PLUMBER. (No, we cannot. There is yet to be a perfect water waste preventer invented.)—BRICKS. (Not worth twopence—avoid all such "receipts.")—LEARNER. (A capital course—don't waste your time at Conduit-street.)

## Correspondence.

### STRAINS.

To the Editor of the BUILDING NEWS.

SIR,—The first diagram in the letter from Col. Seddon which you published on Aug. 31st, if it does not prove my case, at least shows upon what faulty premises he bases his own argument. Completely changing the conditions of the problem, for a homogeneous beam he substitutes one built up in segments with elastic joints. The joints naturally adjust themselves to the direction of the tensional strains upon them, for the beam falls into the same curve as would be assumed by a string supporting equal weights at equal horizontal distances.

The second diagram goes to prove my case. At each abutment, according to Col. Seddon's reasoning, there would be no shear. He cannot contend, however, that there is no reaction, for although the upward and downward forces are equal, they are not placed so as to neutralise. The reaction of the supports have therefore to be met by a load causing a cross strain in the beam. Unless such a cross strain (commonly known as shear) does exist, there cannot be equilibrium; therefore, there is a shear in the beam at each abutment equal to its reaction.—I am, &c., G. A. T. MIDDLETON.

### ARCHITECTURAL PLAGIARISM.

SIR,—Mr. Hall—if you may judge from his letter in your issue of the 17th inst.—seems to have made a discovery, and to be very much pained at it. He calls it by the above heading.

Now I would ask Mr. Hall what better a man can do than—given that he has no "ideas of individuality" of his own—to copy from such a man as Mr. Waterhouse, or even Mr. Hall himself, provided that he wants a faithful copy? Are we not all copying and embodying the ideas of others, and has it not been so from the beginning? Who can say that he is original? We only succeed in being good plagiarists when our souls are enlisted in the work, and then only after years of study and thought.—I am, &c., EDWARD CALVERT.

10, North-street, Andrew-street, Edinburgh, Sept. 3.

### GROUND FLOORS.

SIR,—For ground floors where you have sleeper walls, plates, and joists in the usual manner the average cost is about £5 per square. If, instead of this, you fill up the space under floor with chalk, lime core, or any similar rubbish, well rammed, to within 6in. of the finished floor level, and on that lay 3in. of Portland cement concrete, and on that 2in. of coke-breeze concrete, you can nail the floor-boards down to the coke-breeze concrete, and the cost will be about £3 10s. per square, or a saving of 30s. per square.

The coke-breeze concrete is formed with four parts of coke-breeze to one of Portland cement, and should be thoroughly mixed in a dry state and then water gradually added till the mixture is quite sloppy; this is necessary, because the coke-breeze absorbs a great quantity of water. Before the coke-breeze concrete is laid strips of wood 4in. by 2in. should be placed at intervals of 6ft. or 8ft. to form screeds so as to get a level surface. The coke-breeze concrete requires leaving for at least three weeks before the floor-boards are laid; but there are few cases where this is not possible, as the concrete can be laid as soon as the walls are up to floor level.

In all cases (three) where I have used this kind of flooring the results have been perfectly satisfactory, and, I need hardly say, very much better on the score of health and comfort.—I am, &c., CHARLES F. MOXON.

A new central telephone exchange office has been fitted up and opened at Manchester, in the Royal Exchange buildings. It contains in the switch room, which is 120ft. by 24ft. 1,800 wires connected by nine tables with a multiple switch board, and is regarded as the most completely-fitted building of the kind yet created. The structural alterations to the premises have been carried out by Messrs. R. Neill and Sons, of Manchester, from plans by Messrs. Mills and Murgatroyd, of that city, the architects to the Royal Exchange.

Mrs. Turner, of Bradford, has contributed the sum of £3,000 towards the recently consecrated Church of St. Hilda, West Cliff, Whitby, as a special memorial to her late son, the Rev. John Turner, for over three years curate of Whitby. The memorial will take the form of the building of transepts, vestries and choir stalls, sedilia, and other fittings in the chancel of the church. The work will be carried out from the original plans for the completed church prepared by Mr. R. J. Johnson, of Newcastle, the architect of the church.

The directors of the Buxton Gardens Company approved, on Friday, the plans of Mr. W. R. Bryden, architect, Buxton, for the erection of a building connected with the existing Pavilion in which theatrical and variety entertainments may be given. The estimate is £3,000, and the building, which will be simple Gothic in design, is to hold 710 persons. Building operations will be commenced in October.

The newly-appointed lecturer on architectural construction at Liverpool University is Mr. J. Battye, A.R.I.B.A., of that city, who will begin his lectures on Tuesday, October 9, and deal with subjects of interest to architects and those engaged in building. Each evening a preliminary lecture is delivered, and is followed by class work in the preparation of detailed drawings.

Mr. Michael Francis McElvoy, formerly of the Science and Art Department, South Kensington Museum, London, and late of the Royal College of Science, Dublin, Ireland, died on the 27th ult at his residence in Dublin.

## Intercommunication.

### QUESTIONS.

[9740].—**Headstones and Monuments.**—Can some reader inform me of a really good modern work (illustrated) on Headstones, &c.?—CONSTANT READER.

[9741].—**Drainage of Country House.**—I want to arrange the drainage of a country house. I thought of letting the sink discharge in the open over a "horsepot." If I lead the pipe from this and that from the bath and w.c.'s into one trap, with an inspection cover, ought they to enter the trap on the same level? Does the ventilating pipe communicate with this trap, and should it be connected with the soil-pipe at both w.c.'s? The sewage goes to a covered tank about 60ft. from the house. Will this length of drain want any ventilation? Should be glad of advice.—STACK-PIPE.

[9742].—**Baths.**—Will any of your readers inform me if there is any better system than copper cylinder and high-pressure boiler for getting hot water to bath-room and lavatory and scullery sink of a moderate house? Also if there are any good books upon this subject to be purchased?—DARLUS.

[9743].—**Fixing Marble Wall Lining.**—What is the best method of lining brick walls with  $\frac{1}{2}$  in. marble, and in what sizes should the slabs be used? Some advise me to bed it solid on a rendering of cement, and others to block it off the walls, leaving an air space behind to prevent discolouration, each slab being cramped and doweled with brass cramps and dowels. Will some reader experienced in the work kindly give a short specification and much oblige?—SEPIA.

[9744].—**Surveyors' Institute Exam.**—Will anyone kindly tell me what course of study is the best to pursue for the above, and whether classes are held for same?—H. J. G.

[9745].—**Variouse Veins.**—Is there any remedy for the continued standing that one has to do whilst drawing, more particularly details?—DRAUGHTSMAN.

### REPLIES.

[9700].—**Quality of Woodwork.**—"Durability." In his reply (Aug. 24) says he only partially agree with me in my reply (Aug. 17) to the original question (Aug. 3). He follows with a string of observations, some of which are wholly outside the question—as, for instance, wood suitable for joinery, the quality of modern flooring, &c., the original question being confined to timber as used for constructional purposes. Other of his remarks, although they are the result of over fifty years' experience, are open to question. I cannot enlarge upon my reply (Aug. 17), as he does not state which part of it is in question; but he affords me ample opportunity of reverting to the subject. "D." says: "I find the quality of timber and deals now used in building much inferior to that formerly employed, the reason being simply its cheapness to the builder without a corresponding benefit to the employer." This is a popular assertion, which should, in my opinion, be made with some reservation. We must rule out the time when English oak was the material of construction, and come to the general introduction of soft or fir wood, which hardly carries us back beyond a century. This pictures a time when only the best qualities of sawn goods were imported from the North of Europe for joinery purposes, and the hewn timber from Memel, &c., came to hand for carpentry with a great volume of small square timber, which was supplemented with timber from Scotland. This was largely used for joists, roofing, &c., as may be proved by examining any old building of an ordinary kind of that date. This small timber still reaches us from the Baltic, and is largely used as prop wood in our colonies. The better class, known in the trade as *Mauerlaten*, is used in scaffolding in London and other towns. All this wood to-day is looked upon as too common and sappy to be used as building timber. At a somewhat later date colonial spruce was introduced from Canada, and it rose to be the great staple in the building trade, as it is to-day along the West Coast of England and in Ireland. This spruce is used to some extent in London; but in comparison with the Baltic shipments of to-day it occupies a very subordinate position. If we take Baltic timber only, I agree that the remark bears some show of truth; but it may be thus explained. The removal of the duties upon other than colonial timber admitted the lower qualities of wood goods from the Baltic being brought into competition with the Canadian spruce, with this result: that the qualities of building timber, taken as a whole, improved, but that the qualities of Baltic fir wood, taken by itself, deteriorated. "D." says, "The best timber for carpentry is Memel, of which there are several qualities—crown, first, second, and third." This means that the wood is sorted into four qualities. There is no such sorting in the timber trade. The qualities are best, or first middling, second middling, and common middling, or Bauholz. He further says, "and for joinery Petersburg deals of several qualities selected according to the proportion of sap and knots." It is a fact that Petersburg and all other deals are sorted irrespective of sap. As to St. Petersburg being the best, what becomes of the claims of Archangel and other White Sea shipments? The prices of which now rule as follows per Petersburg standard:—

	Archangel.	Petersburg.
3 + 11 and 3 + 9 (best) .....	£16 15 0	£13 17 6
3 + 11 and 3 + 9 (2nd) .....	£12 5 0	£10 17 6

As the special merits of these woods are for joinery or high-class bench-work, I think the answer is obvious. If not, the practical users of wood have something to learn from "D." Take the next assertion, "for internal woodwork Gefle deals are very satisfactory." I am not of this opinion. It is a fact that, compared with St. Petersburg and the White Sea shipments, Gefle and all the Swedish stocks are hard and strong, and when worked up they cannot be relied upon to stand. The Swedish manufactured joinery is defective for this reason, and no English manufacturers of joinery will work upon Swedish wood, as practice inclines them to the softest and mildest shipments, such as we get from St. Petersburg and the White Sea. I admit that the best qualities of Gefle maintain a high price; but the quantity produced is not

above  $\frac{7}{8}$  per cent. to 10 per cent. of the stocks, and, compared with the best Russian stocks, is a very small factor in the trade. I admit that Gefle is a good timbering wood, and this is perhaps what "D." means by "internal woodwork." If so, how can we reconcile the next statement—"The general run of Swedish deals, if used . . . in framing of doors and such-like work, will not retain its shape, but twists to a serious extent"? I cannot admit that the shipments of Gefle, one part only in Sweden, are exempt from this evil, for such is not the case. Again—"The general run of Swedish deals . . . is very productive of dry rot, as witness the number of inquiries on this subject in your paper." This is a new and grave accusation against Swedish goods, and one in which there is no truth whatever. "Dry rot," so called, is the natural destructor or disintegrator of wood; it is a low form of vegetation feeding upon vegetable matter when heat and moisture are favourable thereto. Some species of wood are more prone to its attack than others—for instance, Quebec pine is far more liable than the Baltic fir. The Baltic fir itself differs in its power of resisting this insidious disease. Its power lies wholly in its degree of resinous impregnation; hence we find that all fir woods, Memel, for instance, growing on the southern fringe of the great forest belt of Northern Europe, is strongly impregnated with resin, the knots invariably red and sound, the wood hard and durable, and practically exempt from the ravages of dry rot. As we approach the northern range of these forests—instance the wood from the White Sea—resin is practically absent; the knots are dead and black, the wood soft and light, and defenceless against the attack of dry rot. It is always a rule, and always will be, that the softer the fir wood the weaker its bearing power, and the shorter its life or durability. If there is one thing more peculiar to the Swedish shipments of fir wood than another, it is its hardness, arising out of its resinous nature and its consequent durability. The geographical position of the Swedish forests is proof of this. The peculiarity of the shipments of the Baltic, if we except that of St. Petersburg, which is a mild, soft wood, owing to its being brought from more northern forests by means of the inland lakes, which find their outlets in the Neva, is that it is hard, strong, and resinous, and consequently durable—i.e., less free from the ravages of dry rot than softer and milder wood. The question of the "abominable foreign-sawn boards" I will not touch upon, although I could offer some interesting remarks thereon; but will pass on to—"The best deals in my early recollection were Archangel. I have seen them placed in the most trying situations, and after fifty years they are perfectly sound. This article is not in the market now, but a spurious substitute has been sold under that name." This evidently means that Archangel at one time was a valuable wood for timbering or constructional purposes, a statement I beg to challenge. It never was, nor never will be, a durable timbering quality of wood "when placed in the most trying situations." It is too soft and light to merit such a title. Archangel is inferior for timbering purposes to St. Petersburg wood, and immeasurably so to the best Finland and Swedish stocks. As to this old-fashioned article not being in the market now, it is all nonsense. The same thing is said of St. Petersburg, but there is no truth in it. Take the first quality of Archangel and Omega goods of high-class shippers, such as Brandt's and the Omega Wood Co.'s, or the first quality of St. Petersburg goods, such as Gromoff's, and nothing better need be desired, and, indeed, nature does not produce better, and it never did in my experience, which extends to nearly fifty years. I can furnish an interesting note respecting Archangel fir and its shortcomings on the point of durability. A few years ago a large cargo of 9ft. 10in. x 10in. sleeper blocks was imported into Grimsby with the idea of competing against the ordinary Memel and Riga sleepers. They were much admired on arrival for their cleanness and freedom from sap, but no sleeper-buyer would operate upon them. The surveyors of the great railway companies refused to pass them, and they were cast out of the trade. Their softness and absence of resinous matter, which condemned them for the purpose for which they were imported, suggested their use for joinery or bench-work. They were cut into deals, and disposed of to builders and manufacturers of joinery. Sundry parcels have appeared upon the market since this date, all of which have passed into consumption in the same manner.—Wm. STEVENSON, The Park, Scarborough.

[9724].—**Quantities.**—Mr. Lovegrove says, "It is the custom to describe all floor joists except ground joists as *unframed*." If so, is not the custom a bad, vicious, and untruthful one that should be discarded? Its breach would certainly be more honourable than its observance. The object of quantities is to get a true statement of the work, and not to class that as "*framed*" which is not framed any more than other is "*wrought*," which is rough from the saw.—X.

[9731].—**Claim for Damage from Settlement.**—Is it not possible, if not probable, that B's house is settling from the very same cause as A's, especially if both houses were built at the same time on a clay soil? I should be very careful about bringing an action.—H. L.

[9732].—**Contractors and Quantities.**—If quantities were sent to all the builders tendering by the architect's instructions, the builder might make what estimate he pleased, but he would still be liable for the surveyor's charges.—H. L.

[9732] and [9737].—**Payment for Quantities.**—The contractor is only liable for such a sum in payment for quantities as he is directed to include in his estimate. If he states, in giving in his tender, that he has included nothing for quantities, the sum allowed for them by the other contractors should be added to his tender before it is considered, and he will then be on the same footing as the others, and will be liable. 1. The proprietor of a building is liable for quantities as for drawings and specification, if he sanctioned their preparation. 2. As before stated, the builder is only liable to the extent included in his estimate. 3. The architect is liable to the surveyor, and the proprietor to the architect (see 1). All such difficulties are avoided by being paid for the quantities directly by the client, as was obligatory on members of the Institute until recently.—EBORTAL.

[9734].—**Contract and Conditions.**—The contract may be made by an elaborate agreement, a letter, or by a stamp on the form of tender; but the conditions are set forth separately, and form, together with the drawings and specification, the basis of the contract.—H. L.

[9735].—**Timber.**—The meaning of "thick baited" as applied to fir trees at page 169 in my recent work, "The Trees of Commerce," is that the annular rings or zones of wood are thick, and the longitudinal section of the wood is coarse in texture and appearance. This is a trade term that, so far as my experience is concerned, is of broad application. I have not been able to satisfy myself about the spelling, as I fail to find it in any modern dictionary. It appears in N. Bailey's Dictionary, published in the early part of the last century as follows:—Bate: the texture of wood. "N." does not give his reference to the use of the term "Southern Russian ports." I presume its use is applied to that great seat of the wood trade, the Baltic Sea, where the North Prussian and the South Russian ports embrace Memel, Dantzic, Libau, and Riga. The Black Sea ports are certainly more south than the southern ports of Russia in the Baltic; but "R." is not correct in stating that we do not get timber from there. For some years past we have been doing a large and increasing trade with Odessa and Sevastopol in oak timbers and wainscot logs and boards. It is practically the same oak as we get from Riga, the better brands of the latter being drawn from the neighbourhood of Kief. I have always understood that the correct term for the region south of St. Petersburg, the agricultural zone, is "Southern Russia," and that the region north of that city, the forest zone, is "Northern Russia"—with this qualification, that they are both in Europe.—W. STEVENSON, The Park, Scarborough.

[9737].—**Quantity Surveyor's Fees.**—1. The employer is liable to pay the charges of the surveyor for preparing quantities if the work is not carried out. 2. If the works are carried out the builder is liable, provided that it is clearly stated in the summary. 3. The architect would be liable if he himself employed the surveyor without reference to a principal.—H. L.

[9737].—**Quantity Surveyor's Fees.**—(1) Cannot be answered without further particulars. Who ordered the quantities—owner or architect? If the latter, was order given with sanction of owner? (2) Ordinarily yes, but somewhat depending upon circumstances. (3) In "Gordon v. Blackburne" in the Lord Mayor's or Sheriff's Court, London, it was decided that the plaintiff (quantity surveyor) could recover from Blackburne (architect), who gave the order without disclosing his client in a case in which the building was not carried out. This case was in January, 1879, and probably reported in BUILDING NEWS, February, same year. But it must be borne in mind that although the decision was the opinion of a trained lawyer who was the judge, the Court is not a Court of Record, and the judgment, though probably a sound one, is not a precedent to be quoted as law in a Court of Law. It arises out of the legal principle that if an agent does not disclose his principal at the time of making a contract, the other party to the contract may elect to hold responsible either the principal or the agent, or both jointly, but in the latter case may lose one set of costs. It must also be borne in mind that to make the principal liable it must be shown that the agent has not exceeded his authority.—A. H.

### CHIPS.

Some time since a large clock was erected at Adderbury church, Oxfordshire, by John Smith and Sons, Midland Clock Works, Derby, and now the same firm have fixed a large carillon, in connection with the clock, which plays seven tunes on eight bells (one tune for each day of the week), at three, six, nine, and twelve o'clock. The largest bell is 25wt.

The Preston town council considered, at their last meeting, a report by Mr. Reah, the borough surveyor, on the sewerage of the town, in which a fresh scheme was proposed in consequence of the present sewers being tide-locked twice a day and consequently converted for the time being into elongated cesspools. The estimated cost of the scheme is £130,000. A committee was authorised to call in an engineer to report on the scheme and to report back a month hence.

A proposal has been made to pull down the new Anglican cathedral in Melbourne, now approaching completion, and to erect it elsewhere. In consequence of the land boom, little difficulty, it is stated, would be experienced in disposing of the site for nearly £500,000.

The tottering edifice which for many years served the purposes of a Catholic church in Ashbourne, Derbyshire, has been replaced by a plain but handsome Gothic church dedicated on Sunday, August 26th, under the invocation of All Saints. The design was executed by Mr. Simpson, architect, of Manningham, Bradford, Yorkshire, and has been carried out by Messrs. R. and H. Gratton, builders, Ashbourne.

St. Saviour's mission chapel, Exmouth, was reopened on the 30th ult. after enlargement by the addition of a north aisle, raising the accommodation from 240 to 340 sittings. Mr. R. Medley Fulford, of Exeter, was the architect, and Mr. Hooper the builder.

Mr. Arnold Taylor, one of the Local Government Board inspectors, held an inquiry at the town hall, Selby, on Friday, as to the application of the Local Board of Health for powers to borrow £2,050 for the purposes of street improvements.

A congress of delegates of societies of antiquaries is proposed to be held at Burlington House under the auspices of the Royal Society of Antiquaries on some day during the ensuing autumn, the objects of the conference being—first, the better organisation of antiquarian research; and, second, the preservation of ancient monuments and records.

## LEGAL INTELLIGENCE.

**DAMAGE BY SEWAGE WORKS.—ARBITRATION.**—In this case, which was before Mr. W. J. Beadel, M.P., as umpire, at the Surveyors' Institution, a claim was made by Mr. Bradshaw, the owner of some land at Ponder's End, against the Cheshunt Local Board. It appeared that the Local Board carried an effluent sewer across the plaintiff's land from Duck's-foot Lane, which would prevent the use of part of the land, as the sewer could not be built over without permission. The plaintiff claimed £542 14s. 3d. His case was conducted by Mr. Terrell, barrister, who called Mr. Richard Cook, surveyor, Mr. Henry Lovegrove, F.S.I., and Mr. J. T. Newman. Mr. Firth, M.P., conducted the case for the defendants, and he called Mr. Edward Tewson, F.S.I., of the firm of Messrs. Debenham, Tewson, Farmer, and Bridgewater, and Mr. T. Bennett, the surveyor to the Local Board. The arbitrator has given his award: £54 12s. 6d. to be paid to the plaintiff.

**THE WEAVER TRUSTEES AND THE VYRNWY WATER SCHEME.**—Sir Douglas Galton has printed his award in the dispute between the River Weaver Navigation Trustees and the Corporation of Liverpool as to the method by which the pipes from Vyrnwy to Liverpool should be carried across the river Weaver. The trustees desired that a tunnel should be made at a considerable depth below the river, through which the pipes should be carried; but Mr. Deacon, water engineer to the Corporation, thought that a simpler and cheaper plan would be to dig a trench across the bed of the river and place the pipes in it. After hearing much evidence, the arbitrator has now given his decision in favour of that plan, modifying, however, Mr. Deacon's proposals by a stipulation that the pipes must be laid at a considerable depth below the bottom of the river, and be covered with a thick layer of concrete. The estimated difference in cost between the tunnel and trench was £10,000.

**WOODEN EXHIBITION ERECTIONS AND THE BUILDING ACT.**—At Hammersmith Police-court on Friday Mr. Paget heard several cases as to the wooden buildings erected in the grounds of the Irish Exhibition at Olympia without a licence from the Metropolitan Board of Works. Mr. St. John Wontner appeared on behalf of Mr. Knightley, the district surveyor, the defendants being represented by Mr. Campbell. The case against Mr. John Henry Rafferty, in regard to the arena or grand stand, was first taken. Mr. Wontner said that in May the erection of the arena and other buildings was commenced, and Mr. Knightley wrote to the various parties who had charge of them, giving notice that they had no right to erect them without a licence. Mr. Rafferty gave the architect instructions to apply for a licence. An informal application was made, but the buildings were erected, and had been in occupation ever since. The parties simply laughed at the Act. Mr. Knightley was called, and, in cross-examination, said that, in June, he was told that Mr. Birch (the architect) had made an application to the Board, but it was informal. Drawings of the buildings were sent in. The Board wished for further drawings, which were furnished during the vacation. Mr. Campbell showed that the buildings were surrounded by a high brick wall, and were 62ft. from buildings outside. Mr. Wontner explained that the arena was only 22ft. from a café, another large wooden building in the grounds. Mr. Campbell said that in the construction of the buildings every suggestion made by Mr. Knightley had been attended to. In the next case Henry Etherington was summoned in respect of the switchback railway. Mr. Birch was called, and said there was delay in getting the drawings of buildings in consequence of the number of contractors. There was a third case against George Baker, who had erected the Irish village. Mr. Paget, in dealing with the cases, imposed a penalty of 40s. upon Mr. Rafferty, and 10s. upon each of the others, remarking that substantially application had been made for the licence. He granted two guineas costs in the case of Mr. Rafferty, and one guinea in each of the other cases.

**HAWKSLEY V. THE LIVERPOOL CORPORATION.**—The result of a recent arbitration between the Council and Mr. Hawksley, by which that engineer has been awarded £14,000 and costs, came under discussion at the meeting of the Liverpool City Council on Wednesday. Mr. Bower, chairman of the Water Committee, explained the nature of the dispute with Mr. Hawksley, and urged that, notwithstanding the award of £14,000 to Mr. Hawksley, the payments previously made to him of £20,617, and the estimated cost of the arbitration, £4,000, the result really was a saving of £42,000, inasmuch as the Corporation were relieved of commissions further payable to Mr. Hawksley. In the course of a discussion, Mr. Hughes thought the Corporation had received a warning not to put into their agreements clauses relating to arbitrations, which appeared to involve more delay and greater expense than trials in ordinary courts.

## Our Office Table.

THE engineering laboratories at University College, Liverpool, are in course of construction from Mr. Waterhouse's designs, and are far from completion; but the professor of engineering intends to begin work therein during the month of October. One part of the new building is to be finished and railed off for use, so that the pupil-teachers in the elementary schools in Liverpool may be taught the elements of wood-carving and fretwork. The children in the elementary schools are to be taught gratuitously by a peripatetic system now being elaborated, by means of which the teacher and the materials will go from school to school at certain hours, and give lessons in woodwork. The idea is not to teach a trade, but to train the hand and eye of all the likely children, as a first step in the direction of technical education. It is expected to be one of the finest engineering schools in the kingdom.

A PAPER on "Scottish Masons' Marks" was read by Professor T. Hayter Lewis, F.S.A., at Glasgow on Friday evening, at the closing meeting of the British Archaeological Association. Professor Lewis remarked that of those curious marks Scotland possessed a greater number than perhaps could be shown in England. They were found out on nearly every Mediaeval building of importance, and on very many buildings of greater antiquity. Many, if not most, of these strange marks had a definite meaning. Generally it was found that the same forms which were used in early times were continued in the later, though they were more ornate. After describing the marks as found in different localities and countries, he said that putting together all the information they had, they found first that certain definite methods of marking the general surface of the stone characterised the masonry of the styles which they called Norman; and that they apparently had a Western origin; second, in the 13th century there was introduced with the Early Pointed style an entirely different method of finishing the surface of the stones, and the source of this method was apparently from the East; third, that masons' marks did not appear to have been continuously used in Europe until late in the 12th century; and, fourth, that some of the most prominent of the marks appeared to have been used continuously from very early times in Eastern countries. He was not enthusiastic enough to suppose that these marks which the workmen had left would ever be so outspoken as to tell definitely of the great mind that was their pioneer; but he believed that the search into their meaning—a search which commenced only some fifty years ago—might lead to the discovery of the place and the means by which its influence was so powerfully and quickly spread.

SIR J. C. Robinson points out a danger to water-colours which has been too generally unconsidered—namely, the traces of chlorine employed in bleaching the rags in the process of making the paper, and which it is impossible by any amount of after-washing to eliminate from the material. Sulphide of soda is, it is true, afterwards mixed with the pulp to neutralise the chlorine, but the care of workmen cannot be guaranteed or very well tested, and the sulphide of soda itself is not without effect on some colours. He suggests that paper-makers should—as one engaged in the industry has already done—turn their attention to the manufacture and supply of non-chemically treated papers. The time, skill, and labour bestowed on his work by the water colourist, are thrown away if the colours prove fugitive, and no artist would grudge a slight extra expenditure for the material on which he works if he could thereby insure its being free from exerting deleterious influences on his tints.

What is believed to be the tomb of Madoc ap Gryffyddmael, grandson of Owen Gwynedd, Prince of Wales, has been discovered in the ruins of Valle Crucis Abbey, Llangollen, of which he was the founder about the year 1200.

The bells of St. Wolfran's Church, Grantham, were re-opened on the 23rd ult., after being rehung on new framework and beams by Messrs. Taylor, of Loughborough. Mr. J. Hall, of Grantham, was the builder.

## CHIPS.

Mr. E. H. Shorland, of Manchester and London, has recently supplied his inlet ventilators to the Isle of Wight Infirmary, Ryde.

Messrs. C. Isler and Co. have just completed a 436ft. artesian bored tube well at Messrs. Hargreaves and Co.'s, brewery, Abridge. The chalk was reached 80ft. nearer the surface than anticipated by several gentlemen connected with the Geological Survey. The water stands at 37ft. from the surface, and the supply obtained is over 1,500 gallons per hour. These results are particularly gratifying, as at Epping, Longton, and other places where wells have been sunk on the old principle to over 1,000ft. deep, they have totally failed. The supply was reached in the first 100ft. in the chalk, and it was by employing a specially designed deep well pump, and working it at various depths, that the above results were obtained.

A two-light stained glass window has just been erected in the parish church of Hanging Heaton, near Dewsbury. The principal subject, which runs through both lights, represents "Mary at the feet of Christ." In addition to this, the left-hand light has two groups, "The Descent from the Cross," and "The Last Supper"; and the right-hand, "Mary at the Sepulchre," and "The Agony in the Garden." The work has been executed by Jones and Willis, of Birmingham and London.

We regret to record the death of Mr. Edgar John Varley, the Curator of the Royal Architectural Museum, Westminster, who died on Monday night last at his residence, St. John's Hill, Clapham Junction. Mr. Varley, who was in his fifty-fifth year, succeeded Mr. Randall Druce, who resigned two or three years ago. He was an architect by profession, and was the eldest son of the late Charles Varley, and grandson of the late John Varley, and one of the founders of the Old Water-Colour Society.

A tower and spire are about to be added to the Roman Catholic Church at Holyrood, near Belfast, from plans prepared by Mr. M. H. Thomson, of Belfast.

The College Hall, which has been erected at Bangor for lady students attending the classes of the University College of North Wales, is to be opened by Lady Penrhyn on October 3. Mr. L. O. Williams, Liverpool, is the architect.

New board schools are to be opened on the 10th inst. at Quarry Bank, Kingswinford. Messrs. Dorae and Son, of Brierley Hill, are the contractors, and Messrs. G. B. Nichols and Son, of Birmingham, are the architects.

The Noble Hospital on Crellin's Hill, Douglas, Isle of Man, was opened by Lieutenant-General Walpole on Tuesday. The hospital and grounds upon which it stands have been presented to the town by Mr. and Mrs. Noble, at a cost of about £8,000. The architects are Messrs. Bleakley and Cubbon, of Birkenhead, whose design was illustrated in the BUILDING NEWS for July 2, 1886. The contractors are the executors of the late William Gradwell, of Barrow-in-Furness. The facing materials are red-pressed bricks and terracotta from the works of Mr. J. C. Edwards, of Ruabon. Shorland's Manchester grates, assisted by Boyle's ventilators, are used throughout the wards for heating and ventilation.

A new branch railway has just been constructed from Drumsoreland Station to Broxburn Oil-works, with a goods station at Holygate. Messrs. T. Pate and Sons, of Airdrie, were the contractors.

A life-sized statue of the late Hon. F. J. Tolle-mache is to be placed on St. Peter's Hill, Grantham, to harmonise with the existing one of Sir Isaac Newton. The estimated cost is £1,200.

The parish church of Dent, Yorks, is about to be restored from plans by Messrs. Paley and Austin, of Lancaster.

The foundation-stone of new Roman Catholic schools at Weston, near Runcorn, was laid on Tuesday. The school will be 40ft. by 20ft., and will accommodate 100 boys and girls. Mr. Thomas Kirkham is the contractor.

The tender of Messrs. H. Dorae and Son, of Cradley Heath, Brierley Hill, has been accepted for the erection of a Primitive Methodist chapel and school in connection with Bourne College, Quinton near Birmingham.

Mr. Goschen has sanctioned the purchase for the British Museum of the greater portion of the collection of Indian coins formed by Sir Alexander Cunningham, who was for thirty years at the head of the Archaeological Survey of India. The collection is chiefly of gold and silver coins, and embraces the period between the time of Sophyte to the English conquest.

The tower of the village church of Kimpton Herts, is now being restored by Mr. John Thomp-son, of Peterborough, from plans by Mr. J. Oldri Scott.

AND ENGINEERING JOURNAL.

VOL. LV.—No. 1758.

FRIDAY, SEPTEMBER 14, 1888.

## THE SYMBOLISM AND ICONOGRAPHY OF EARLY AND MEDIAEVAL CHRISTIAN ART.

By GEORGE ASHDOWN AUDSLEY, F.R.I.B.A.  
(Author of "Handbook of Christian Symbolism,"  
and several works on Architecture and Art.)

IT is, perhaps, not too much to say that the intelligent appreciation and study of the works of Early and Mediaeval Christian Art are quite impossible without a clear insight into, or knowledge of the symbolic language which everywhere pervades them, and to which so much of their life and expressiveness is due. Wherever we concentrate our observation on the glorious works of Christian art—be it on the great ecclesiastical structures in stone, the brilliant fields of storied glass, the frescoed or mosaic-covered walls and domes, the glittering pages of illuminated manuscripts, or the countless masterpieces of the embroiderer's, the enameller's, and the metal-worker's arts—there we find the language of symbolism written in no timid characters, albeit those characters may be but imperfectly understood by him who looks to admire or condemn the outward forms rather than to appreciate and realise the meaning and teaching which underlie the whole. As the Abbé Auber says:—"The religious symbol—the idea which takes form at the creative breath of the plastic art—is to be everywhere seen in the Christian world. It has always played a highly important part therein, though this has only been perceived by the small number of students who have given serious attention to the fact, and even by them only to a limited degree. The majority, on the other hand, have always declined to notice this mysterious laconicism of Christian Art, which has so much to say, for those who can read it, even on a small piece of stone."

There is no question that a widely-spread ignorance obtains at the present day with reference to this branch of art study, fostered in the generality of instances under the conviction that it amounts to little in the end, and that it is, from first to last, painfully dry and uninteresting. Students and lovers of the works of the great epochs of Christian art would do well to bear in mind that it is about as easy to open a hold-fast safe without the key to its complicated system of bolts, as to unfold the meaning and realise the full expression of the works of the Mediaeval artists without the key to the symbolical language in which their ideas are set forth. To all those who are interested in the development of Christian art in the past, and its advancement at the present time, the study of the Symbolism and Iconography of both the eastern and western churches is of the highest importance and interest. We venture to think a very superficial survey of Christian art will be sufficient to prove this; whilst we are certain that a concentrated survey of one or two of the more important works which have been spared to us from the Middle Ages, will convince anyone blessed with an open mind and a fair amount of artistic culture, that the study of the symbolic language, which has so long been a handmaid of our religion, cannot fail to interest and benefit the student, and especially the student of architecture.

To give even the faintest outline of the symbolic and iconographic systems which are presented by such buildings as the cathedrals of Chartres and Bourges, in France, St. Mark, at Venice, and Monreale, in Sicily, would require a series of very elaborately

illustrated articles, and, these, we regret to say, cannot be contemplated here; but it is quite in order that some information should be forthcoming, in this introductory article, as to the sources from which such complete systems were derived. First, however, it is, perhaps, desirable that the reader should be in a position to form some mental idea of the extent to which such systems were carried by the artists of the Middle Ages; and the following remarks by M. Didron, whose writings on Christian Iconography and art we highly respect, notwithstanding that we are bound to differ from some views expressed therein, will convey, in a few words, the information necessary:—"Between the 9th and 17th centuries of our era, and under the inspiration of Christianity, the arts of the sculptor, carver, engraver, painter, and weaver were devoted to the production of innumerable statues and sacred objects for the adornment of cathedrals, parish churches, chapels, colleges, abbeys, and priories. Certain large churches—such as those of Notre-Dame, at Chartres, the cathedrals of Reims, Paris, and Amiens, were ornamented with two, three, or four thousand statues of stone; and, as in the case of those of Chartres, Bourges, and Mans, with three, four, or five thousand figures painted on glass. Formerly there was not a single church, however small, which did not possess thirty, forty, or a hundred figures in sculpture or painting. If we, then, take the mean between the lowest and the highest numbers, and multiply it by the number of the sacred edifices which existed in France prior to the heretical devastations of the 16th century or the political destructions of the 18th century, we can comprehend the importance which Christianity had accorded to the plastic and decorative arts. Of these figures and other works, executed by sculptors, carvers, or painters, the inclemency of the seasons, the course of centuries, and the revolutionary ravages of man have singularly diminished the number; but the entire iconographic series represented at Chartres and Bourges are still in existence. About three-fourths of the original series at Lyons remain; whilst rather more than half of those which adorned the Cathedral of Reims and Strasbourg are still preserved. The great cathedrals, or those which were most crowded with worshippers, were better protected from ravages of all kinds than were the churches of the second or third order; accordingly France is at the present day incredibly rich in statues and painted glass. The single city of Troyes contains no fewer than nine churches lighted entirely by stained-glass windows, painted with sacred histories, executed between the 13th and 17th centuries."

In addition to the matchless iconographic system presented by the sculptures of Chartres Cathedral, we must recognise the rich field of study offered by its wonderful stained glass. A simple enumeration of its windows will convey an idea of its wealth in this direction. There are, of 12th-century date, three singularly rich and noble windows. Of 13th century date there are one hundred and twenty-five large windows, three immense roses, thirty-five lesser roses, and twelve small roses. Of the 14th century there are six large windows and two medium-sized roses; and of the Renaissance period there are two small roses. In all, one hundred and eighty-five grand windows, presenting thousands of portraiture, histories, and symbolical subjects. On the iconography of these windows we shall have to speak in future articles.

The mosaic decoration of the cathedrals of St. Mark, at Venice, and Monreale, near Palermo, also present fertile and highly interesting fields of study to the lover of Christian Symbolism and Iconography, as will be seen during the progress of our present treatise.

Now let us direct attention to the more important sources from which the artists of the Middle Ages, in Western Christendom, derived the inspiration which led to the production of such wonderful and systematic iconographic series as those just commented on. Didron was the first to direct attention, in our day, to these sources; and all subsequent writers on, and students of Christian art must acknowledge their debt of gratitude to him.

During the eleventh and two following centuries, numerous works were written by men deeply learned in the theology, legends, philosophy, natural history, and the arts and sciences of their times, and a mania for classification seems to have seized them all. This was the encyclopedic era, which gave birth to ponderous tomes—agglomerated treatises on every subject, divine and human, natural and supernatural—into which the builders of churches and the artists employed in their adornment eagerly dived for guidance and inspiration. The most noteworthy of these works as well as most esteemed in their time were the *Summa Theologicæ*, of St. Thomas Aquinas; the *Speculum Universale*, of Vincent de Beauvais; the *Legenda Aurea*, of Jacques de Vorage; and the *Historica Scholastica*, of Pierre Mangeur. In the *Summa Theologicæ*, St. Thomas collected and classified all the theological learning of his own and previous epochs; in the *Legenda Aurea*, Jacques de Vorage gathered all the sacred legends and histories which were, up to his time, scattered in numerous manuscripts, or which had been handed down by oral tradition; in the *Historica Scholastica*, for the first time the historical parts of both the Old and New Testaments were brought together, to inspire artists in the graphic rendering of their "sacred histories"; and in the important *Speculum Universale*, Vincent de Beauvais, the preceptor of the children of St. Louis, and probably the most profound scholar and philosopher of the thirteenth century, classified all human knowledge in accordance with a system or plan unequalled up to his day, and probably unsurpassed since. Here, then, as in vast storehouses, lay piled up an immense mass of suggestive and well-arranged material, that the artists of the greatest church-building epoch the world has ever known had only to seek for to find.

It is sufficient for our present purpose to take one of these great encyclopedias, preferably that of Vincent de Beauvais, and opening its pages, glance therefrom to the iconographic system of Chartres Cathedral. Without literally quoting Didron in his treatment of this subject, it is desirable to follow him in his method of instituting the comparison between the work of the great encyclopedist and the systematic iconography of Chartres.

Vincent de Beauvais adopts a strictly chronological system, ingeniously interweaving with it dissertations on all branches of human knowledge and labour. His method of classification with reference to natural objects is an admirable one. He begins by speculating on the foundation of all things, telling how God alone existed in His eternal being and illimitability. Then how the Creator, desiring to behold Himself reflected in His works, and to receive love and adoration henceforth, called the angels into existence. Here Vincent pauses to contemplate God, and consider the nature and the attributes of Divinity; then passes on to the first act of the Creator, and speaks of the celestial and infernal spirits, the earliest of created beings. Vincent now descends to the visible world. God creates the heaven and the earth, and then follows a treatise on geography and mineralogy. The creation of the sun, moon, and stars introduces a dissertation on astronomy, and, in accordance with the philosophy

of his age, a treatise on astrology. Appended to the day in which the vegetable world is called into existence is a treatise on botany and its application to agriculture and horticulture. The creation of the birds, beasts, and fishes is followed by a treatise on zoology. Now man is called into being, and Vincent indulges in a learned disquisition on the physical and mental powers of the human body, on anatomy and physiology, and on the different races of mankind. The seventh day has come, and God rests. At this point the encyclopedist pauses to examine and discuss the disposition, beauty, and harmony of the universe.

Then comes the disobedience and the fall of man, disturbing the harmonious scheme of creation; and for the first time the powers of nature break their bonds, and human passions assume their potent sway. Here Vincent closes his first section or "Mirror of Nature."

Man has fallen away from his original perfect state, but he has still the means to restore by science much of what he had lost; so the indefatigable encyclopedist opens his second section—his "Mirror of Doctrine"—by teaching man to speak, to reason, and to think. Then follow treatises on grammar, logic, rhetoric, geometry, mathematics, music, astronomy, and other sciences, with their application to the economy of domestic and public life, and to the mechanical arts, to architecture, to navigation, the chase, to commerce, and to medicine. Order and progress are observed everywhere.

Now, Vincent opens his "Mirror of Morality." He teaches mankind to walk according to both the laws of God and man: he points out his duties by instructing him in all the moral virtues, and proceeds to discourse on them all in separate essays. Man, he says, must have faith, hope, and love; and he must be chaste, humble, meek, patient, temperate, courageous, and prudent. The award of his virtues will be the happiness of heaven, and here the encyclopedist proceeds to describe that marvellous happiness as an incentive to good works. Then, as might be expected, he draws the other side of the picture in discourses on purgatory and hell, where all classes of sins receive their award. Not a single moral treatise is overlooked in this "Mirror" which has any real claim on the mind.

In the fourth and concluding section of his great work, entitled the "Mirror of History," the encyclopedist writes, with no timid pen, the universal history of mankind. He commences at the gates of the terrestrial Paradise just as Adam and Eve are driven forth to work out their doom in toil and sorrow, and then passes in review the history of all the branches of the human race, in all epochs, until he reaches the year 1244, that in which his own labours were brought to a close. Up to this point Vincent had developed everything worthy of his consideration on a wonderful system—analytical, chronological, natural, and historical—which must have greatly impressed the scholars and artists of the 13th and immediately succeeding centuries.

The past had been fully treated of, and the lore of all nations and periods had been studied, and stored up in the pages of his voluminous work for the instruction of coming generations, yet Vincent de Beauvais did not lay down his pen. The knowledge of and insight into the workings of nature and the thoughts and actions of mankind led him, with almost prophetic power, to speak of the future. So his book is continued until it ends with the destruction of the universe and the final judgment day. As Didron says:—"He tells us when time shall be accomplished, when the universe shall be destroyed; when the whole human race shall be judged; and when eternity shall recommence, only having been interrupted by the

creation of the universe and the history of mankind. He also comments on the end of the world, and its destruction by water or fire; and he predicts all the phenomena that will precede the last judgment." With this awful subject he closes the *Speculum Universale*.

In our next article we shall endeavour to show the good use which the sculptors of the cathedral of Chartres and other important churches made of this remarkable book, and the other classified and encyclopedic writings of their times. It is only by a careful tracing of the sources of inspiration in such matters that the archæologist can hope to read aright the sermons in stone which meet his eyes in the great Christian temples of the Middle Ages.

(To be continued.)

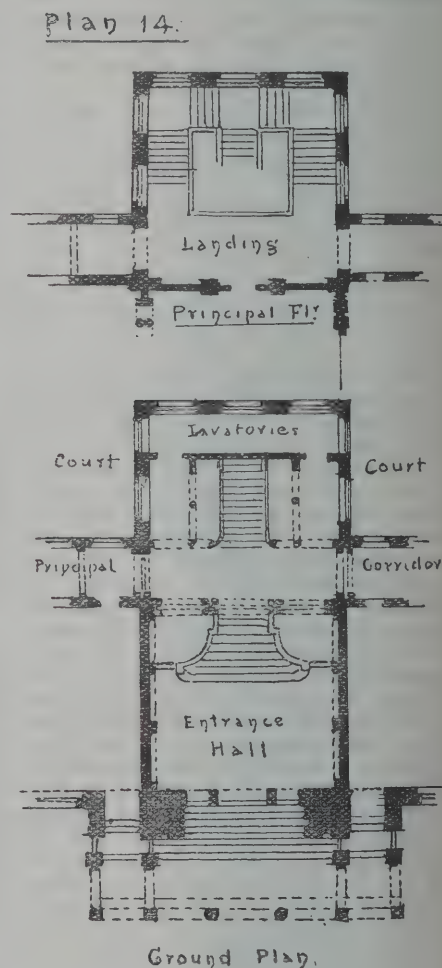

#### HALLS AND STAIRCASES.—V.

IN the present article we propose to discuss the architectural aspect of halls and staircases when they are placed in a central position or removed from the outer walls, and we may first consider the arrangement with regard to private residences of a large class. The entrance hall and staircase generally form a central feature of the plan, lighted by a lantern or skylight in the roof, as we observe in most Classic residences, with reception rooms on each side; or they may be so situated in the interior as to receive

light from an open court. Several notable examples of houses with central stairs will occur to most of our readers. Blenheim Palace, by Vanbrugh, with its large central hall in the axis of the portico, and the lateral staircases, one on each side; Kedleston Hall, Derbyshire; Longleat House, of the Early Renaissance era, by John of Padua; Wollaton House, with its great central hall; Holkham House, and a score of other domestic edifices of the 17th and 18th centuries may be enumerated to show how important and public a position was assigned to the hall and stairs. Longleat is a capital instance of a plan with open courts in the centre, between which is the staircase, a double open newel arrangement projecting from the cloister or corridor. But this palatial style of hall-planning is no longer the fashion. The hall and staircase have both dropped from their high position to one of lesser significance. Though central, it is not emphasised externally, or it may, in fact, be rather on one side of the main axis of the building.

Many of the old buildings in London have, or once possessed, admirable staircases. One of the finest of the Domestic class is that in Stafford House, on the plan of the letter *m*, a central flight and two others branching from it, supported by the side walls of hall. The hall was adorned by columns. The well known staircase at Ashburnham House, by Inigo Jones, is an elegant example of stair-planning, and that master of the English Renaissance knew how to make the most of a limited area. The stairs open out of one side of an inner hall about 23ft. by 17ft., to which they are made central by ten steps; there is then a quarter space or landing; another three risers to the right hand gain ascent to a half-landing. Turning to the left, the visitor ascends the next parallel flight of nine risers, where there is another quarter landing. Keeping to the left he ascends eight more steps, making in all thirty risers to the first

floor, giving access to the ante-room, grand drawing-room, and dining room. The flights are thus broken up into four flights, one of ten risers, one of three, a third of nine risers, and a fourth of eight risers, the bottom and top flights parallel to each other, also the second and third parallel, but at right angles. The staircase hall is, in fact, L-shaped, 23ft. 7in. long one way, and 21ft. 9in. the other; the flights are about 6ft. wide. Two back windows light the main flights, which are on the newel plan. A very easy gradient is given to the steps, which are 5in. rise, and 14in. treads; Ionic pilasters adorn the walls of staircase, and one isolated column with its engaged pilasters forms a kind of screen between the staircase and the upper landing. There was a coved ceiling and an elliptical lantern supported by Ionic colonnettes grouped in threes.

The chief point to strike the visitor in this unique example of staircase arrangement is the manner the real staircase hall is

approached from the inner hall by a short projecting flight of ten steps at right angles with the main stairs. The staircase proper begins when the visitor had ascended the first two flights of thirteen steps; it is then the beauty of the design reveals itself, and the elegant recessed landing with its isolated column at the top becomes visible. The top flight is at least 7ft. wide, the second from the top under 6ft. wide.

A convenient position for a staircase is at the junction of two corridors in a large house. Plan 13 shows an effective arrangement: the staircase hall is rectangular, lighted by a window from an inner court, with a screen of columns or arcades continuing the inner lines of corridors. The outer entrance hall is in this case a separate apartment for callers and strangers' reception, the principal reception rooms being grouped round the staircase hall. A central disposition of staircase adapted for a public building is best arranged by obtaining lateral courtyards or areas, on both sides of it, or by allowing the staircase portion to project beyond the rear wall of the building. A dignified and imposing plan of hall and stairs may be thus obtained on the axis of the building or vestibule. Many examples of this arrangement are to be met with in our public edifices. The plan of the flights admits of several modifications. Taking a square-shaped hall, the commencing flight may be arranged central with the entrance, say, of five or seven steps to a square landing, then a right-angle flight also short on each side, and then return longer flights parallel with the first along the walls. This plan is shown in diagram A, and may be called the double open newel plan, and on account of its ease in ascent and descent, and number of landings, is one of the forms best adapted for public use—assembly halls, theatres, picture galleries, and museums. Two distinct flights are provided from the first floor landing, and as they meet within a few steps of the bottom, the lower flight should be made wider so as to allow both streams of people to descend and pass down without confusion or crowding. The wing flights, if long, can be broken in the centre of their length by a landing, as shown in our sketch. From an architectural point of view, this breaking up of the long stair branches with a bottom short flight arranged centrally is decidedly an improvement on the ordinary wall flight, as the raking lines so inimical to repose and architectural dignity of character are less distracting and long. Even such an arrangement as that shown in plan B is more architectural than stairs beginning next one wall and finishing on another (plan D), which is the common mode. The central commencing flight can be arranged to coincide with the axial line of an arch or arcade of three arches, and by curving the lower risers and making a curtail step at the bottom, an inviting appearance is produced. One of the finest examples of this arrangement is the grand marble staircase of old Chesterfield House, the plan of which resembles diagram A; but instead of square open newels, these are made with circular turns, and the steps ascending right and left from the first landing are curved so as to produce an easy and graceful ascent, the corner platforms being omitted. The great staircase of the British Museum is a type of the square arrangement of wing flights; another good example is to be seen at the Fishmongers' Hall. The new stairs to the Mercers' Hall, Cheapside, is a recent instance of a staircase designed on the plan of diagram A; there is a short central flight of six or seven steps from the hall to a square landing; then right and left of this a short flight, with a corner landing, from which long flights parallel with the first, ascend to the first floor; but half-way landings are introduced, as we have shown, which

break their long raking lines. At Freemasons' Hall the same principle is adopted, the side wells having semicircular open newel ends or cylinders and a domical hall. St. James's Hall shows also this plan; but it is needless to multiply examples. Hampstead Vestry Hall has also the same arrangement, which is well suited to the requirements of a public hall. Sometimes the short second flights are all thrown into a single long landing, extending from wall to wall, from which the side flights ascend. In large public buildings we see occasionally a reversal of this arrangement. Instead of one central flight there are two side-wall flights ascending from the hall level, which join one central and often wider flight of stairs to the first floor landing (see plan C). This plan has the advantage of dispersing the crowds descending to the ground floor. It can also be made an architectural arrangement, the flights being disposed symmetrically, and is well

adapted to a columnar hall in Classic-designed buildings. When side corridors communicate with the corner landings, there is reason for adopting this plan in preference to a single ascending flight. When, however, the principal staircase is made an entrance or exit to or from other parts of the building, the first landing or platform should extend the whole width of hall, the centre or wing flights ascending from it. The new Sunderland Municipal Buildings (Mr. B. Binyon, architect) show an arrangement of hall and staircase, lighted by side areas, based on the principle we have been discussing in this article—that of a central and two branching flights. The plan requires space, however. A very well designed staircase suitable for public use is that by the late F. P. Cockerell at the Royal Society of Painters in Pall Mall. In designing a public staircase, the architect should consider first his area, second the apartments to which the stairs are to give access. If the latter are small or only offices,

the staircase may be limited in size and importance; but if the principal rooms are on the first floor, or a public hall or picture galleries are to be approached, the adoption of a spacious and imposing staircase, such as we have described, is called for. Our Plan 14 is a development of the central axial arrangement for a public building, and resembles that of the Birmingham Council House, designed by Mr. Yeoville Thomason. The entrance hall, reached by a flight of steps from the portico, has a broad circular-ended flight of steps leading to the main corridor, from which level the main central flight of the staircase rises, the wing flights supported by small columns. The groups of columns in the outer hall, and the inner screen of columns before the staircase, separate the main public corridor, access to which is gained by the wide flight of centre steps.

## THE TURKISH BATH: ITS DESIGN AND CONSTRUCTION.

By R. OWEN ALLSOP, Architect.

### VI.—HEATING AND VENTILATION.

THERE are two ways in which heat may be applied to the body—by direct radiation, as from the sun or an open fire, and by transmission, as through a volume of air.

The ancient Roman bathers, with floors below them which rested upon *pilae*, or little pillars of brick or tile, around which the flames and hot gases from the furnace played, and surrounded by heated, hollows walls, evidently submitted themselves to the action of a heat that must have been of a more or less radiating character.

So, also, in a less perfect manner the Turks, who employ flues running beneath the floors, and the Moors, who adopt stoves visible to the bathers. Systems similar to the ancient and Oriental methods have been tried in this country.

Theoretically, radiant heat in a bath is vastly superior to that which is transmitted to the body through the medium of the air. Its virtues have been extolled by the late David Urquhart, and other eminent authorities on the bath. "There is a difference," says Mr. Urquhart, "between radiating and transmitted caloric. . . I cannot pretend to treat of this great secret of nature; to work out this problem a Liebig is required. This I can say, that such heat is more endurable than common heat. There is a liveliness about it which transmitted heat lacks. You are conscious of an electrical action. It is to transmitted heat what champagne is to flat beer."

Practically, however, matters take a different aspect. The gain in quality of heat of a purely radiating character is counterbalanced by the difficulty of ventilation in cases where this principle is adopted; whilst the inferior quality of transmitted heat is more than compensated by the gain in point of ventilation which is attained by the full and constant flow of freshly heated air. In a bath the importance of perfect ventilation cannot possibly be over-estimated, as not only has the respired air from the lungs to be removed, but also the deleterious exhalations from the skin which are produced by perspiration. A rapid and continuous flow of pure, dry, freshly-heated air through the hot rooms has, therefore, been found to be the best practical method of maintaining the requisite temperatures. Some day, peradventure, the hypothetical method of employing pure radiant heat may be rendered possible and practicable, and we may be placed in a bath where we shall receive great heat whilst breathing a comparatively cool atmosphere, and thus receive a measure of that electrical invigoration we experience when, in some sheltered bathing cove, we have exposed our bodies to the fiercest rays of the morning sun whilst yet we breathe the fresh, cool, ozone-laden air.

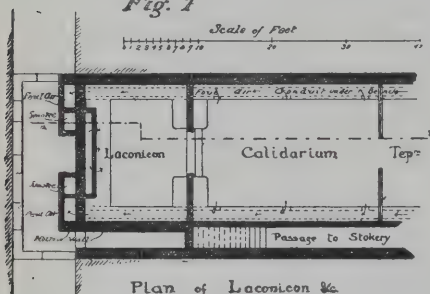

It being demonstrated that the best method of heating a Turkish bath is by the supplying of pure hot air, we must consider the necessary appliances and arrangements. These comprise a furnace in its chamber, with flues or shafts supplying cold, and drawing off the heated, air, and a stoker with provisions for

firing and storing coke, &c. Too often the stokery is unscrupulously cramped, and the life of the stoker thereby rendered anything but pleasant. Its design is a simple matter, and perhaps for that reason neglected. The arrangement and construction of the furnace chamber requires care, and the selection of a stove or furnace great judgment. As regards the latter feature, the most important point to consider is the nature of the heating or radiating surfaces. What will raise the air to the required temperature without, in the process, depriving it in any way of its vitalising elements, and without adulterating it with either smoke and fumes from leakage, or with particles of foreign matter given off from the material employed in its construction?

In theory, again, there would be nothing better than ordinary fire-brick. From this

Fig. 1

Plan of Laconicum &amp;c.

Plan of Furnace &amp; Stokery

Section on line A-B

material a soft heat is given off, differing in quality from that obtained from iron. An iron furnace, however, is more economical of working expenses; and, it is asserted\* by some, that hitherto all attempts at the employment of a fireclay furnace for a hot-air bath have had to be abandoned. The constant repair of such stoves, it is said, compels those who have given them a trial to abandon them in favour of those with an iron radiating surface, in spite of the objection that, when super-heated, particles of metal are thrown into the air. Of iron furnaces there are many placed before the public; but though all are doubtless suited to ordinary requirements, there are few that are capable of creditably fulfilling the conditions indispensable for the hygienic heating of the air for a Turkish bath. These conditions may be summarised as follows:—

1. A maximum of heating-surface, with a minimum of grate space.
2. Perfect immunity from the danger of leakage from the furnace into the hot-air chamber or conduit.
3. Freedom from the defect of liability to over-heat the air.
4. Inability to adulterate the air by throwing off matter from the heating-surfaces.

Such primary essentials must be constantly borne in mind by the designer of furnaces for

\* With questionable accuracy. In my next article I shall humbly endeavour to show how a fireclay furnace might be constructed with satisfactory results. Not being prepared with the illustrations, I am compelled to continue the subject of "Heating and Ventilation" in my next, trusting that the reader will pardon the consequent diffuseness.—R. O. A.

Fig. 2

the hot-air bath. Their importance must be obvious to all.

Of the many iron stoves Messrs. Constantine's "Convolut" stove has been adopted the most frequently as an eminently practical furnace for the effective heating of sudatory chambers, and maintaining very high temperatures in the laconicum. The appearance of this stove is familiar to all architects, and it will be unnecessary, in these pages, to minutely describe its construction, as, being largely employed for general warming purposes, most persons are acquainted with it.

The method of constructing a furnace suitable for a small public bath is, however, shown at Fig. 2. The excavations for stokery and heating chamber being completed, and the position of the furnace determined, a solid foundation of concrete must be prepared, upon which the brickwork to support the stove must be laid. At the same time the foundations for walls of furnace chamber, stokery, coke store, and the side walls for the horizontal cold-air-conducting flues will be prepared. These latter must then be built in half-brick with glazed interior face, and the furnace inclosed in similar work as shown in perspective sketch. The flues must be covered with York stone slabs 3in. thick, up to within three inches or so of the convolutions of the stove, at which distance the side walls of the furnace must be erected, the back one similarly, and the front one round the four projecting doors, which are, respectively, the ash-pit door, the fire door, and two doors for cleansing the horizontal smoke-box and interior of convolutions. The furnace walls must be continued up till a few inches above the bend of iron smoke flue, and then—if, as shown, the furnace be small—covered with a 4in. York slab in one piece. If the furnace be large, a flat brick arch must form the covering as shown in Fig. 1, where this arch supports the flooring of the laconicum. The openings for the admission of the heated air into the conduit leading into the hot rooms may be either directly above, as shown in the last-named illustration, or in the side, as in Fig. 2, with inclined flues. As a rule, it is more economical, in heating, to place the furnace below the level of hot rooms; but if desirable to place both on one level, the back wall of the furnace chamber becomes the party wall of the laconicum, and it must be stopped short of the ceiling, and the air debouched over it.

In cheap baths the interior face of furnace chamber may be of stock brickwork; but best glazed work should be adopted in good ones. All hot and cold-air ducts should be similarly lined with glazed ware. In first-class work the floors of horizontal and inclined flues should be of white glazed tiles set in cement. Manholes must be provided for cleaning when necessary. Every portion of furnace chamber, flues, shafts, and conduits for hot and cold air must be "get-atable" either by means of manholes or by long

brushes. Air-tight doors must be indicated on plans wherever this necessity demands them.

The iron smoke-pipe from furnace must be conducted to the smoke flue, and the connection between furnace chamber and flue hermetically sealed. The walls for a small furnace chamber need not be more than 4½in. thick. Large furnaces require walls one-brick thick.

The cold-air flues leading from either side of the furnace must be conducted to their respective inlets. If possible, at least two inlets should be provided, facing different ways: this with regard to the possibility of certain winds sucking the air out where it is wanted to enter. The openings should be vertical, like windows, and in cities furnished with a solid frame and casement, fitted with louvres of

Fig. 3

plate glass with polished edges. Between the rebate and the casement it would be a good plan to leave a space of an inch and a half for a movable stretcher-frame holding several layers of "cheese-cloth" to filter the air. The construction of such an air filter is shown at Fig. 3. The glass louvres keep out the wet, and throw off coarse particles of falling soot; and the provision of a movable stretcher would allow of the cloths being frequently changed for clean ones—a very important point, though little attended to, if not, perhaps, wholly ignored.

The position of air intake is a matter of great importance, especially in large towns. It evidently is bad to draw a supply of air from the bottom of an area. Even the position shown in Fig. 1 is not good; the shaft should be

carried higher. The best places for the intakes are where there is always a current of pure air blowing, and away from smoky chimneys. Theoretically, it would seem that the higher the level of intake the better; but in cities, by going high we get among the belching chimney-tops, even if we escape the stagnation below. Moreover, a high inlet with a strong wind tending to exhaust the air in shaft might find the architect with the cold air sweeping through his bath, and all the heated air rushing up the supply-shaft. A large "lobster-back" automatically turning towards the wind, would in many cases prevent such a disastrous result. Even in low-level intakes, as I have said, trouble will sometimes arise from the same cause. This may be remedied by providing more than one inlet, so that only the one facing the current of air will be employed, the other being closed, which could be effected by fixing the glass louvres, spoken of above, on pivots, and connecting them with a rod and adjustable rack. It would be a very simple matter to make the wind itself automatically open and shut the louvres.

The theory of the heating and ventilation of the hot rooms requires most careful study, and the particular scheme to be adopted in any new bath must be well considered with respect to the restrictions of the site. At Fig. 1, I have endeavoured to show how to make the best\* of what is perhaps a bad job; the site only admits of ventilation at a back area: it is impossible to construct flues anywhere else, and the fresh air must be drawn from the same area. On the ground floor are cooling and dressing rooms; the bath rooms are in the basement, and the furnace in a sub-basement, reached from a passage at the end of the stairs for the bather. Two convoluted stoves are shown in a vault; three air-inlets are provided, and the foul air is drawn up into the smoke flues, two in number, which, above, could join one another. Let us follow the air in its passage through the bath. Entering at the intakes, any coarse impurities are thrown off by the smooth louvres, and the tendency of finer particles to rush in is checked by the stretched canvas cheesecloths, and, thus deprived of its actually visible impurities, the air passes through a longer or shorter conduit of glazed brickwork until it reaches the horizontal flues running to beneath the furnace walls, along which it is rapidly drawn, and, ascending between the walls and heating surfaces and between the two adjacent heating surfaces, absorbs the radiating heat and enters the laconicum by way of the rectangular shaft constructed above the vault spanning the two stoves.

Questions of temperature I will omit for the present. The air, on passing through the laconicum, will be practically pure, as it is in such great bulk compared with the number of occupants of this highly-heated chamber, and it will not be absolutely necessary to provide ventilators. These should commence to be placed in the caldarium, and should, in the scheme of ventilation here considered, be so disposed that the nearer they are to the lavatorium and shampooing-room, the more frequent will they become. The object of this disposition of outlets for vitiated air is, that the cross currents thus created may not interfere with the main flow from the heating chamber to the lavatorium. Were too many ventilators to be placed near the hotter end of the sudatory, this stream would be diverted. Too much of the freshly-heated air would flow out at these points, and the onward movement of the air would be enfeebled. There would then be difficulty in maintaining the heat in the tepidarium and lavatorium.

In passing onward through the various rooms two changes are wrought in the air: it loses so much of the caloric with which it is charged for every foot it travels, and it becomes laden with the exhalations from the lungs and skin of the bathers. A large proportion of carbonic acid is thrown into the air, and as the normal temperature of the human body remains, in a healthy person, at about 98° Fahr., and rises but a few points even when submitted to the action of heat, these exhalations, in addition to being heavier than air, are very much below the average temperature of

a sudatory chamber. Consequently they fall, and must be extracted at the floor level.

The total area of the outlets for vitiated air should be about equal to the area of the narrowest part of the shaft that conducts the fresh, hot air from the heating chamber. Thus, supposing the latter to be 10 superficial feet, and the size of outlet ventilators a clear 12in. by 3in., there may be 40 ventilators disposed round the bath-rooms, say, eight in the caldarium, 14 in the tepidarium, and 18 in the combined shampooing room and lavatorium.

In the diagrams at Fig. 1 the foul-air conduit is the space comprised under the marble-topped benches running round the hot-rooms. At the end of the laconicum they enter flues, which I have shown as running side by side with the smoke flues.

The purity or foulness of the air in the hot rooms forms all the difference between a good bath and a bad one, which latter is infinitely worse than no bath at all. There exist, at the present time, scores of baths where the foul odours of the sudatory chambers are nauseating. Such foulness arises from stagnation of the air. There is no continuous flow, and the respirations and exhalations of the bathers are not removed. A system of ventilation may be pointed out, but it is on the wrong principle, and does not act. There is no change of air. The atmosphere of such places becomes pestilential.

I therefore make no apology for continuing the subject of "Heating and Ventilation" in my next article, when I will give diagrams of methods of ventilating hot rooms on sites where one is not so handicapped as at Fig. 1. Moreover, there remains to be considered the heating power of furnaces, the amount and rapidity of the flow of air through the bath, the variations of temperature, and other important questions.

(To be continued.)

#### ADAMS' PATENT SYSTEM OF SEWER VENTILATION AND AERATOR.

BY means of the patent aerator shown above, a continuous inflow of fresh air to the sewer is obtained, the air thus carried into the sewer reducing its temperature, and by purely natural means (the dilution and oxidation of the gases) relieving the sewer of its noxious gases.

The aerator A is placed on the direct line of sewer or drain, all liquid passing through it; an air pipe, B, is connected, as shown, and carried up to level of road, where it is protected by a small iron ventilating cover. The sewage as it flows through the pipes enters A and passes out into the lower sewer, in its passage through the apparatus A, setting up an even and continuous current of air from the air inlet pipe B to the sewer, taking the direction indicated by the dotted arrows. This current is constant so long as the sewage flows, and exerts its influence for good over the whole length of pipes, varying only in power with the increasing or diminishing flow of liquid through the pipes.

A practically unlimited supply of air may be fed to the main sewer by fixing an "aerator" on each house drain; this is the most simple mode of aerating old sewers where the apparatus cannot perhaps be placed on the main line.

The minimum fall, about twice the diameter of pipe, gives a steady flow of air down the pipes. Where greater fall can be given, an increased effect is obtained by inserting a lengthening piece. This is not necessary to the efficient working of the apparatus.

The flow of sewage along the drains gathers impetus in its passage through the aerator; this will, in a large degree, be an equivalent for the flat gradient upon which a drain may be laid for the sake of actuating the ventilating apparatus.

#### SKETCHES OF A FEW CHAIRS.

WE illustrate a few Chairs sketched a short time since. The white and gold Sheraton Chair is a beautiful example of refined and quiet design. The Italian carved oak Chair is quaint and well carved. The Century Guild Chair is a most curious design, very difficult to make, as the back panel requires delicate workmanship, showing a species of water-lily growing up to the surface of the water and intersected by the long green leaves. The Arm-chair next is a mixture of styles, but quaint, nevertheless. The little Chair below is a modern copy of an old Dutch example. The Chair next it is easily recognised as of Chippendale's make by the characteristic plume, &c. It is interesting to note the art and workmanship as set forth in these different chairs; in nothing does the spirit of the age show forth more than in a chair. For instance, may be noted the sturdy character of the old English oak work, and the changed style and design in those used by the fine gentlemen in the last century, made by Sheraton, Chippendale, and others.

#### OLD OAK CHAIR, MAIDENHEAD.

THIS measured sketch of an old oak Chair, by Walter Peart, belongs to Mr. J. Lee, of Maidenhead, in whose possession it has been for nearly twenty-five years. The chair has had a new scroll to the left arm many generations since, its only repair. The back may have been surmounted by an ornamental scroll to indicate its ownership, for there is an unevenness at the top surface of the rail, which suggests that a portion may have been removed. It is of English oak, and the inlay interlacing pattern in top rail, styles, and on arms, appears to be in boxwood. The royal characters and the figures of date are of black wood or black mastic. The inlay patterns on the back are in coarse-grained black oak, and the cone-like figures in them are of elder or acacia wood.

A new tower has just been completed at the parish church, Rawtenstall, from designs by Mr. Lawrence Booth, of Manchester. The tower is in the Early English style, harmonising with the church, but of a more ornate character. An octagonal turret at the north-east corner of the tower contains a stone staircase leading to the several floors, and forms the most prominent feature, being carried up considerably higher than the pinnacles at the other corners. A peal of eight bells and a clock with four dials are ready to be placed in the tower. Mr. S. Hobson, of Rawtenstall, was the builder.

Mr. John P. Roe, for many years engineer to the Consett Iron Company, died on Saturday at his residence at Consett, Co. Durham, aged 73 years.

\* Not quite the best, as with a more elaborate method of extracting the foul air the arrangement could be considerably improved, as I shall subsequently show.—R. O. A.

THE VATICAN LIBRARY, ROME.—NEW SUNDAY-SCHOOLS, WORCESTER.—LONDON AND SOUTH-WESTERN BANK.—FIRST AND SECOND-CLASS WORKMEN'S DWELLINGS.—CHAMBERS MEMORIAL, EDINBURGH.—A PRIEST'S STOLE.—OLD OAK CHAIR AT MAIDENHEAD.—SKETCHES OF OLD CHAIRS.

## OUR LITHOGRAPHIC ILLUSTRATIONS.

## THE VATICAN LIBRARY, ROME.

THE first literary treasures of the world are contained within the presses of the Great Hall of this renowned library, illustrated by our double-page plate to-day. This Hall is, in fact, one of the most magnificent of its kind, and may be described as almost unique for the splendour of its decorations and richness of its contents. The apartment measures 230ft. in length and 56ft. wide. It has a double-vaulted ceiling supported by pilasters, and is richly decorated with frescoes and arabesques by Scipione Caletani, Paris Nogari, Cesare Nebbia, and other artists. The paintings on the walls represent on one side the foundation of the most celebrated ancient libraries, and on the other side the different councils of the Church. The panels on the pilasters illustrate the inventors of the characters or letters used in expressing the principal known languages. Between these piers are arranged a number of handsome presents sent to the Popes of this century. The marble pavement adds to the grandeur of the building, and was laid by Pius IX. as a substitute for the old red-tiled floor left by Pius VI., who otherwise completely renovated and restored the fabric. The modern works of art contained within this Hall include two fine tables of granite supported by bronze figures by Valadier, and seen in our view; a beautiful column of *alabastro fiorito*; two candelabra of Sèvres china presented by Napoleon I. to Pius VII.; a fine vase from the same factory to Leo. XII. by Charles X.; a vase of malachite by the Emperor of Russia; the Sèvres porcelain baptismal font of the Prince Imperial, sent to Pius IX. by Napoleon III.; a magnificent tazza of Scotch granite presented by the late Duke of Northumberland to Cardinal Antonelli; a very large malachite present by Prince Demidoff; two handsome vases of Meissen porcelain, with views of the royal residences near Berlin, presented by the King of Prussia to Pius IX. in 1860; a fine vase made in Rome from a block of Oriental alabaster, sent by a Pasha of Egypt. Out of the door to the right is the Archivio Secreto, where are preserved the most interesting manuscript historical documents connected with the government of the Papal See, with the diplomatic correspondence of the Popes, &c. This door is a grand specimen of modern intarsia work, with views of the four principal monuments erected during the reign of Pius IX.—the Viaduct of Lariccio, the Basilica of St. Paul, and the tabernacles of the latter church and of the Lateran. The galleries which open from the extremity of the Great Hall occupy a length of 1,200ft., and are divided into several halls, each more or less

elaborated with paintings and works of art. Thus on the end wall of the second hall is an interesting view of St. Peter's as designed by Michael Angelo. In the Museo Cristiano are collections of Early Christian art from the Catacombs, followed by others of almost every style, date, nationality, and character too numerous even to mention here. This photographic illustration of the Great Hall cannot fail to be valued by our readers.

## NEW SUNDAY SCHOOLS, WORCESTER.

THIS building is being erected for the purposes of a Sunday school over, and to accommodate over 400 children. The central hall and gallery is for assembly and discussion, and round it on the ground floor are ten classrooms for boys, and a similar number above for girls, each provided with a separate entrance and the necessary conveniences. Two larger rooms with a separate entrance are also provided for young men's Bible class and other purposes. The boys' entrance is shown in the view. There is also a small library, and kitchens in the basement. The whole is heated with hot water. The building is faced with buff Ruabon bricks and Bath stone dressings. The builders are Messrs. Wood and Sons, of Worcester, and the foreman is Mr. Shepherd. The cost is about £3,500. Mr. Aston Webb, F.R.I.B.A., is the architect.

## LONDON AND SOUTH-WESTERN BANK.

THE site on which these premises have been built has a frontage of about 50ft. in Fenchurch-street and 42ft. in Gracechurch-street. Part of the latter frontage is let off for shops, and other parts of the premises on the upper floors are let as first-class offices, for which the situation is well fitted. The building is provided with a lift to each floor, and is wired so that the same can be lighted throughout by electricity as well as gas. The bank occupies all the frontage in Fenchurch-street for the ground floor and basement, the depth being rather more than 100ft. This is not only lighted from the front, but also from Ingram-court, and by a large glazed lantern in the centre of the building. In this space is contained the lofty banking hall, manager's room, sub-manager's room, waiting room, and private staircase leading to boardroom. The walls of banking hall are scagliola, with a panelling of teak to a height of about 8ft. The columns are also of scagliola. The fittings are of teak, and the floor is of oak in narrow widths, with the exception of space for the public in front of counter, which is laid with a very elaborate mosaic floor containing the arms of the counties with which the bank does business, executed by Messrs. Rust. The gas fittings are of brass, designed both for electric light and gas. These have been designed by Messrs. Strode and Co., of 48, Osna-burgh-street, Regent's Park, and are most suitable to their purpose. In the basement are lavatories, &c., and the sub-basement is constructed for the engine for the electric lighting. The several strong rooms have been fitted throughout by Milners' Safe Company, which is a guarantee of their excellent workmanship and security. On the first floor is a board-room, with waiting room attached. These rooms are panelled with oak to their full height, and the ceilings panelled in plaster. On the second floor a committee room and lavatories, &c., for the use of the board. All the part occupied by the bank can be shut off from the rest of the building by iron doors. The main entrance to the bank is from Fenchurch-street, but there is also an entrance to the bank from Gracechurch-street, which is the main entrance to the public offices in the building. On the first and second floors are spaces fronting Fenchurch-street, about 50ft. by 30ft., suitable for division into offices for a public company or great mercantile firm, and all the offices throughout the building, some of which are already let, are well lighted, and in every way desirable. The walls of staircase, corridors, and lavatories have been covered with ornamental tiling, by Mr. J. C. Edwards, of Ruabon; and Messrs. Campbell, Smith, and Co., have supplied the stained-glass windows. The warming of the bank is by low-pressure steam, and for the offices stoves are used wherever practicable; inlets for fresh air have been contrived through the story-post in banking hall. Portland stone and grey granite

up to window-sills have been used for fronts, and the roof is covered with copper by Messrs. Ewart and Son, of Euston-road. The staircase is of easy rise, and is of iron and concrete with stone treads. The centre space where the lift works is inclosed with an elegant ornamental wrought-iron railing and gates. Iron is used largely in the construction. The general contractor is Mr. Shepherd, and the work has been carried out from the designs of and by the late Mr. T. S. Edmeston, up to the date of his untimely decease, and since then it has been continued and conducted to the conclusion under the superintendence of Mr. E. Gabriel, Mr. W. Tookey has acted as clerk of works.

## MODEL VILLAGE, AINTREE.

LAST week we published the first premiated plans, by Messrs. Sugden and Son, for Mr. Hartley's new model village houses, to be built on the "Reynolds Farm" estate, next his works at Aintree, near Liverpool. We to-day give a sheet of drawings illustrating the houses planned by Mr. Frank W. Mee, architect, of Manchester, and for which the second premium was awarded. The plans show the arrangements embodied in these designs, which are so clearly delineated as to easily explain themselves, and our readers can thus readily compare the relative merits of the two premiated architects' work in this competition.

## CHAMBERS MEMORIAL STATUE.

IN the month of March the Town Council of Edinburgh invited a number of the sculptors resident in Scotland to send in competitive models for a bronze statue 10ft. 6in. high, which is to be erected in Chambers-street, Edinburgh, in memory of the late Dr. Chambers, the well-known publisher, at one time Lord Provost of that city, and through whose munificence the interior of the old Cathedral of St. Giles was restored to its original condition. Only six sketches were submitted, and Mr. Thos. Brock, A.R.A., who was appointed assessor, in his report said: "I am sorry there was not a more general response by Scottish sculptors to your invitation for designs, but nevertheless can heartily congratulate you on having three such excellent sketches to select from. I have no hesitation in recommending for adoption the one bearing the motto 'Nothing Hazard Nothing Have' as being the most appropriate in general conception, and most effective in the views in which it will be seen when approached from either end of the street—a most important consideration. The design 'St. Columba' (which runs the first-named very closely in some respects) I place second, and 'Fiat Justitia' third in order of merit." On opening the envelopes it was found Mr. John Rhind, Cambridge-street, Edinburgh, was the author of the successful design, while his two sons, Mr. Wm. Birnie Rhind and Mr. J. Massey Rhind were the authors of the second and third placed designs, and receive the premiums of £50 and £25.

## A PRIEST'S STOLE (FROM ST. MICHAEL'S CHURCH, FOLKESTONE).

THIS stole was executed in the East Grinstead Sisters' School of Ecclesiastical Embroidery at St. Katherine's, 32, Queen-square, W.C. It was embroidered on cloth of gold in gold thread and silks of various colours, every part being finished up like miniature painting. The drawings are by Mr. Oswald Fleuss.

## CHIPS.

Two busts, which have just been added to the collection of memorials of distinguished Scotsmen in the hall of the Wallace Monument at Stirling, were publicly placed in position on Tuesday. They represent James Watt and Hugh Miller, and have been executed by Mr. D. W. Stevenson, R.S.A., of Edinburgh.

The Peterborough Co-operative Society on Friday entertained the workmen on the new buildings in Park-road, in that city, to a supper at a restaurant. About 70 sat down, and amongst those present were Mr. Hind, of Leicester, and Messrs. Wenlock and Co., the architect and builders.

The county justices of Lancashire have adopted plans by Mr. E. H. Dawson, of Lancaster, for workshops and other buildings about to be added to the county lunatic asylum near that town.

## WAYSIDE NOTES.

THE British Association meetings have been the topic of the past week, even for architects, as, although the *savants*, whose more or less interesting discourses attracted such vast crowds to pretty Bath, did not touch upon the art of architecture, pure and simple, they occasionally commented upon its more practical aspect. At times, however, it would seem that the existence of the science of archaeology was remembered. Last Monday, for instance, there was a considerable assemblage round the oval Roman bath, and a running lecture given on Romans and their baths generally. More than this, on the day following the inauguration of the meetings, Lieut.-General Pitt-Rivers spoke on the subject of the working of the Act for the Preservation of Ancient Monuments, with the carrying out of which he has been intrusted for the last five years. It appears that only one owner of ancient monuments scheduled under the Act of 1882 has voluntarily offered to make use of it. The list of monuments at present under the Act numbers thirty-six, all told, and includes the Pictish Tower at Moussa; Edin's Hall, the Black and White Catherthuns, the inscribed stones at Laggangairn, the circle on Eyam Moor, the "Nine Ladies" on Stanton Moor, the Pillars of Kirkmadrine, St. Ninian's Cave, Uleybury, in Gloucestershire; Kit's Coty House, near Maidstone; the stone circle at Stanton Drew, the tremulous chamber at Stoney Littleton, and the Pentze Evan, in Wales. If the reader can say that he has examined all the above, he may consider himself a small authority on the rude stone monuments of Great Britain. Excepting any visits to works and buildings near Bath, this lecture of General Pitt-Rivers must be considered to be the most architectural thing done at the British Association Congress of 1888.

Sir Frederick Bramwell's opening address was as brilliant and interesting as one naturally expected it would be, even if the subject matter was not altogether new. Any architect listening to the eulogy of the civil engineer must have felt "out of it," to employ a vulgar idiom. To still further murder the Queen's English, I would say that it is time to take a "back seat" when Sir Frederick dilates on the poetical side of the engineer's calling. "Might there not," asked the President, "be true poetry in the feelings of the engineer who solved a problem such as this? This rock, never visible above the surface of the tide, has been the cause of destruction to many a noble vessel which had completed, in safety, its thousands of leagues of journey, and was within a few score mile of port. On it build a lighthouse. Lay the foundations through the water, in the midst of the turmoil of the sea; appear to be attaining success, and find that the whole of the preliminary works are ruined or destroyed in one night. Again commence, and go on until the work rises above ordinary tide level; then upon these sure foundations erect a fair shaft, graceful as a palm and sturdy as an oak; surmount it with a light, itself the product of the highest application of science; direct that light by the built-up lens, again involving the highest application of science; apply mechanism, so arranged that the lighthouse shall from minute to minute reveal to the anxious mariner its exact name and its position on the coast. Is there no feeling of a poetical nature excited in the breast of the engineer who had successfully grappled with a problem such as this?" So spake Sir Frederick; and one would think that every C.E. in the land must, upon reading the address in his morning paper, have felt a warm glow of pride in his bosom; while the humble designer of churches and chapels may well have been quite overcome with mortification.

Joking apart, there is poetry in such an idea; but it would perhaps have been better if the President of the late British Association meetings had not spoken about it. It is not for us to complain, however. In the architectural profession there is far too much gabble about the poetical side of the business. At every opening of the various societies, at every slight pretext, we are telling one another what a glorious and poetical calling is that of the architect; and every youngster becomes blown out with the gas, till his master's office won't

hold him. (This is aside, however.) As regards the poetry of engineering, it is only a very small minority who ever appreciate the difficulties conquered; the many look upon every new achievement with passive indifference. Indeed, we have all of us ceased to wonder when we hear that vast undertakings are to be attempted or have been accomplished—that a lengthy canal is to be cut through every obstacle; that a tunnel is to be driven under a channel of the sea; or that a bridge of enormous span is to be thrown across an estuary. Who expressed wonder that M. Eiffel was about to erect a tower 300 metres in height? The news was received as a matter of course. Long familiarity has bred contempt, and the public mind is dulled to all sense of the credit due to those who have triumphed over immeasurable difficulties of construction.

The new Thames subway, I conclude, was the undertaking referred to by Sir Frederick Bramwell, as likely to be worked by electricity. At any rate, I trust it is so, as it is irritating to know that clumsy wire-rope traction was proposed to be employed for rolling stock in the latter days of the 19th century; an impression, moreover, being thus created in one's mind that the success of the Subway Company was to be subordinated to the success of the providers of the arrangements for the wire-rope traction.

The report of the Inspector-General in Bankruptcy, as affecting the building trades, is very disheartening—or may it be taken to be encouraging? "It is evident," says the report, "that there has been a large amount of speculative building, conducted chiefly upon borrowed money, and characterised in some cases by extreme recklessness. Buildings (chiefly dwelling-houses) have been erected without any real demand, and have either been realised at a loss or held in the face of a constant depreciation in value. Failure has been the inevitable result." All this we knew before. The report might well have stated that speculative building by impecunious "builders" was characterised, in the majority of cases, by extreme recklessness. Mr. Buggins's brazen-faced impudence is astonishing. Failures in the speculative building trade are not on the half-measure scale. Indeed, the whole system may be described as based upon the "neck or nothing" principle—bloated success or ruination. Under these circumstances one is not surprised to learn, from the above report, that in the case of one London builder, the liabilities were £56,000, and the assets *nil*; that in another case the liabilities amounted to no less than £657,000, and assets only £9,000; while yet in a third case the bankrupt was liable for nearly a quarter of a million, with, nominally, £7,000 assets, though, practically, as it turned out, only amounting to £617! It is a very great pity (to put it mildly) that the credit system should exist, in the building trade, to such a tremendous extent. The cash down principle would stop jerry-buildings to-morrow.

Mr. Waterhouse recently addressed a letter to the Right Hon. Lord Balfour of Burleigh on the subject of "jerry-building," suggesting that in the framing of the new Local Government Bill clauses should be inserted compelling rural district surveyors to pass the examination of either one of the three institutes—Architectural, Engineering, or Surveying. Lord Burleigh's reply to Mr. Waterhouse's letter was to the effect that the subject did not come within the scope of the Bill. In the last R.I.B.A. *Journal* there is, I believe, a note saying that the council consider that were such examinations to be made compulsory, jerry-buildings would cease to exist. Then why, in the name of Sir Christopher Wren, did the Institute throw in its weight against the late Architects' Registration Bill, which provided that building surveyors should, before appointment, have passed their own examination, or any other that might be selected?

I fear that I must have British Association on the brain; so the reader will pardon another reference to the Bath meetings. If Professor Oliver Lodge is correct in his surmises, we shall have to pull down all old copper lightning conductors, and reinstate with new of a different description. According to opinions

expressed in his paper read at Bath on the 11th inst., the best method of constructing a lightning conductor is by employing several stout wires of iron, and not of copper. Any shape should be given to the rod other than a bar of circular section; it should be flattened out as much as possible, if not in the form of separate, detached wires. It is some consolation to those to whom the re-modelling of their lightning rods would be a great expense, to know that so great an authority as Mr. W. H. Preece is not impressed with Professor Lodge's researches, but still clings to copper as the most suitable material for their construction. GOTH.

## CHIPS.

A parochial hall at Barton, Herefordshire, was opened on Thursday in last week. Elizabethan in style, it is built of local stone, and roofed with Broseley tiles. Mr. Shepherd, of Worcester, was the architect, and Mr. Hope, of Kingstone, the builder, and the total cost was £400.

The family and friends of the late W. L. Palmes, of Naburn Hall, near York, are about to place a memorial organ in Naburn Church. The chamber is now being prepared, and the contract is to be completed by the 1st of November. Mr. Hodgson Fowler, Durham, is the architect, and Messrs. Forster and Andrews, Hull, are the organ builders. The estimated cost is £400.

Mr. Thornhill Harrison, one of the Local Government Board inspectors, held an inquiry at Beckenham, Kent, on the 6th inst, into an application of the Beckenham local board to borrow the sum of £11,444 in respect of sewer depôts and street improvements in the board's district.

A new church is about to be built at Kenfig Hill, near Bridgend, from plans by Messrs. Halliday and Anderson, of Cardiff.

M. Delebecque, chief engineer of the Northern of France Railway, died on Friday from injuries sustained in a tramway accident.

A subscription portrait of the ex-Mayor of Chip-ping Norton (Alderman Wilkins, who served the office eight years) was publicly unveiled at the Town-hall on Friday evening. The portrait is by E. S. Harper, of Birmingham, and is full length, life-size. It will remain in the Council Chamber, together with a memorial brass by Messrs. Jones and Willis, also of Birmingham.

The quinquennial festival and the opening of the new recreation hall at the Royal Albert Asylum for Idiots and Imbeciles, Lancaster, will take place on Monday next, under the presidency of Lord Herschell. The new building, which has been erected from the designs of Messrs. Paley and Austin, combines a hall for the entertainments and a playroom for the use of girls and junior boys. It is to be called the "Wimmarleigh Recreation Hall."

The town council of Margate has adopted the centre of the Marine-parade as the site of the Jubilee clock tower, and the work of erection will be commenced on the 15th prox. Mr. Pearce is the contractor.

The opening services of Rehoboth Strict Baptist Chapel, Bishop-street, St. Paul's, Bristol, took place on Thursday, the 6th inst. The chapel has been erected at a cost of £400. The building is of red brick with Bath stone dressings, and covered with Bridgwater angular tiles. It will accommodate about 150 persons. The builders were Messrs. J. Curnook and Sons, of Clifton.

A memorial cross 8ft. in height, of Runcorn stone, decorated with floral ornament, has been placed in the Brooke burial-ground at Halton Cemetery, near Warrington, to the late Sir Richard Brooke, and an enriched cross, with ornamented border, has also been built in the wall of the Brooke Chantry of Halton Church. Depending from a sculptured architectural tree are the arms, properly emblazoned, and the label with family name. Below the latter are the Brooke motto and inscriptions. The works have been carried out by Messrs. Williams and Clay, of Warrington, from the designs of Messrs. Douglas and Fordham, of Chester.

Considerable alterations have recently been carried out at No. 4, Moira-place, Above Bar, Southampton, for the Birmingham and Coventry Cycle Company, consequent on their shop at Marsland-place having become unsafe, owing to the subsidence of the foundations. The new premises have a frontage of 55ft. The alterations have been carried out by Messrs. John Crook and Sons, of Southampton, from the plans, and under the supervision of, Mr. E. W. Evans, M.S.A., of 16, Port land-street, Southampton.

A new Roman Catholic church is about to be built in Guildhall-street, Folkestone, from plans prepared by Mr. Leonard Stokes, of London.

Carried to summary ...

STRAINS.—VI.\*

By G. A. T. MIDDLETON,

FLANGE STRAINS (continued).

WHEN, as often happens, a beam has to carry several loads at different points, the strains due to each have to be ascertained separately, and then combined at all points before a girder can be designed to resist them. To do this arithmetically, by ascertaining the strains at several given points from each load in succession, and adding these strains together to ascertain the total strain at each of these points, is tedious in the extreme. Geometrically considered, the problem is an easy one.

In Fig. 31, an outline of short dashes (*rc t*) represents the strain outline due to one fixed load, the dot-and-stroke outline *rit* represents the strain outline due to another fixed load, and the dotted outline *rn t* represents the strain outline due to a distributed load, such as the weight of the girder itself. Of the triangles

*ret* and *rit*, the portion *rst* is common to both—which means that the strains which it represents occur twice over, and that the figure *rcsit* plus the figure *rst* represents the strains

Fig. 31.

due to the two fixed loads. The triangle *rst* has therefore to be combined with the figure *rcsit* to represent these strains in one figure. This can be done by making *cd* equal to *ab*, *ik* equal to *fg*, and by joining *rdkt*. The figure *rdktisr* can now be readily proved by the theory of triangles on equal bases, and with equal altitudes, to be equal to the triangle *rst*. In other words, the figure *rdkt* represents the total strains due to the two loads.

The strain outline *rbnht*, due to the distributed load, can similarly be added to this combined diagram by making *de* equal to *ab*, *op* equal to *mn*, and *kl* equal to *fh*, and by joining *replt* in the firm curved outline shown, which outline represents the total strains at all points due to the two fixed loads and the distributed load.

In all cases yet investigated, it has been assumed that the girders merely rest upon the supports without being fixed in any way. When the ends of girders are fixed, they are placed under an entirely new set of conditions; but it is so difficult to absolutely fix them over single spans that they are almost invariably assumed to be supported only even when held in position by bolts or by a superincumbent weight. When, however, girders are so built as to form one continuous structure over several spans, the portion over each central span becomes absolutely fixed at its ends.

In Fig. 32 an example is given of a girder

Fig. 32.

which is continuous over three spans, *a*, *b*, and *c*. Of these spans the portions *xx* are girders with the top flange in compression and the bottom in tension; while the portions *yyy* are cantilevers with the top flange in tension and the bottom in compression. The strains on *x* are found as usual for girders, with a span equal to *x*. One of the abutments of *x* is the end of *y*, which carries its proportion of the load on *x* as an end load besides any load to which it may itself be subject, the strains being ascertained in the usual manner for cantilevers. The greatest strain will, under almost all conditions, be found to be over the intermediate supports, while there will be no strain at the points where the ends of *x* rest on the end of *y* (which points are called "points of contraflexure").

It has been by the careful adoption of this principle of continuous girders that such immense bridges as that over the Forth at Inchgarvie have been rendered possible.

It is possible to arrive at the strains in the flanges of supported (i.e., not fixed) girders at all points in an exceedingly simple manner by

means of a reciprocal polar diagram, somewhat similar in principle to that shown in Fig. 6. Taking the simplest case—that of a cantilever with an end load—and assuming this load *W* to be equal to 8 tons, acting vertically downwards, set this 8 tons to a scale of weights vertically downwards from a point *a*. (See Fig. 33.) From *a* set off *ao* horizontally, equal

Fig. 33.

to *d*, the depth of the cantilever, and join *ob*. From *r*, a point in the bottom flange of the cantilever under the load, draw *rx* parallel to *ob* on the diagram. Ordinates from *qr* to *rx* will give the value of the strains in the flanges at any point.

The proof of this is simple, for the triangles *xqr*, *ba o* are similar to one another, and, therefore—

$$\begin{aligned} & xq : qr :: ba : ao \\ \text{or—} & xq \times ao = ba \times qr \\ \text{or—} & xq = \frac{ba \times qr}{ao} = \frac{Wl}{d} \end{aligned}$$

proving that *xq* = *S* according to the recognised formula. Moreover, the triangle *xqr* thus obtained is identical with the triangle *xqr* as ascertained in Fig. 16.

In a simple case like the foregoing the advantages of this method are not very conspicuous; but more complicated cases are much simplified by its adoption. Suppose, for example, that the cantilever carries two fixed loads of 3 and 7 tons respectively at different points (see Fig. 34), acting vertically down-

Fig. 34.

wards. According to a scale of weights set vertically down from a point *a*, the distance *ab* equal to 3 tons, and from *b* set down *bc*, equal to 7 tons. From *a* set off *ao* horizontally equal to *d*, the depth of the cantilever. Join *ob* and *oc*.

From the point *r*, vertically under the load of three tons, and in the bottom flange of the cantilever, draw *rp* parallel to *ob*, until a vertical line through the centre of gravity of the load of seven tons is reached in the point *p*; and from *p* draw *p2* parallel to *oc*. Ordinates drawn from *qr* to the outline *xpr* will give, to the scale of weights employed in the

\* All rights reserved.

diagram, the value of the strains in the flanges at all points; and a little consideration will show that the figure  $xqrp$  merely contains the sum of the triangles which would have been obtained had each of the weights been considered separately. Cases in which three or four, or any greater number of loads have to be considered, can be treated in a precisely similar manner, until, by considering a distributed load to be an aggregate of an infinite number of infinitesimal loads, an outline similar to that shown in Fig. 20, can be arrived at. In order to obtain an accurate result, however, in this, as in all other systems in which diagrams are employed, the most absolutely perfect draughtsmanship is essential. In important calculations it is, therefore, desirable to employ a large scale and a fine line, so as to reduce the risk of errors to a minimum.

A simple application of this system to a supported girder can now be taken, in which a weight of eight tons acts vertically downwards

Fig. 35.

at some fixed point. (See Fig. 35.) From a point  $a$  set  $ab$  vertically downwards equal to eight tons to any scale of weights. From  $b$  set  $bc$  vertically upwards, equal to the same scale,  $R_1$ , the reaction of the right-hand abutment. Then  $ca$  will be equal to  $R_2$ , the reaction of the other abutment; these reactions being ascertained by the dotted polar diagrams, as explained in connection with Fig. 6. From  $c$  set  $co$  horizontally equal to  $d$ , the depth of the girder. Join  $oa$  and  $ob$ . From  $r$ , the point in which the bottom flange of the girder meets the left-hand abutment, draw  $rm$  parallel to  $oa$ , and from  $n$  draw  $nm$  parallel to  $ob$ . If accurately drawn,  $rm$  and  $nm$  will meet in  $m$ ,

Fig. 36.

vertically over the centre of gravity of the weight  $W$ ; and ordinates drawn from  $rn$  to the outline  $rmn$  will give the value of the strains in either flange at any point to the same scale of weights as that employed in setting down the diagram. Very little consideration will show that the triangle  $rmn$  thus obtained is

identical with the triangle  $rmn$  obtained in Fig. 25. The proof is obvious and need not be repeated.

The advantages of this method of computing strains are, in the girder as in the cantilever, more considerable in complicated than in simple cases. Suppose that the girder carry two loads of 3 and 7 tons respectively at different points. (See Fig. 36.) From a point  $a$  set vertically downwards  $ab$  to any scale of weight equal to 3 tons, from  $b$  set down  $bc$  equal to 7 tons, and from  $c$  set upwards  $ce$  equal to  $R_1$ , the reaction from the right-hand abutment;  $ea$  will then be equal to the reaction from the other abutment. These reactions, as before, are ascertained by the dotted polar diagram. From  $e$  set off horizontally  $eo$  equal to  $d$ , the depth of the girder, and join  $oa$ ,  $ob$ , and  $oc$ . From  $r$  draw  $rm$  parallel to  $oa$  until a vertical line through the centre of gravity of the load of 3 tons is reached at  $m$ . From  $m$  draw  $ml$  parallel to  $ob$ , till a vertical line through the centre of gravity of the load of 7 tons is reached at  $l$ . From  $l$  draw  $ln$  parallel to  $oc$ . If the drawing be accurate, the point  $n$  should correspond with the corner of the right-hand abutment. Ordinates from  $rn$  to the outline  $rmn$  will give the values of the strains in either flange at any point to the scale of weights employed. It would be found on trial that the polygon  $rmn$  corresponded with that obtained by summing the triangles arrived at by considering each of the loads separately, as explained in connection with Fig. 31. The system is applicable to any number of loads, until, by considering a distributed load as an aggregate of many small loads, an outline similar to that shown in Fig. 29 would be arrived at.

#### TECHNICAL DICTIONARY OF ARCHITECTURAL DESIGN AND BUILDING.\*

THE idea of publishing a dictionary of technical terms relating to architectural design and construction, with derivations and French and German equivalents, is an excellent one, if accuracy and research were combined. There are many technical dictionaries, but few of which the student of architecture can avail himself. For example, the terms "hexastyle" and "decastyle" should have the Greek prefixes *hex*, six, and *stylas*, a column, or *deka*, ten, and *stylas*, a column, affixed, by which attention being called to the derivation of those terms, the student is more likely to remember the meaning of the terms, especially if he have not had the advantage of a classical education. In these days of intercourse with foreign countries, France and Germany more particularly, the value of equivalents in the French and German languages cannot be overestimated. Messrs. Ward and Lock's new technical dictionary, compiled by the Editor of the *Technical Journal*, furnishes these equivalents, or synonyms.

Taking a few terms at random, we have aspe for example, syn.. French *chevet*, German *baseliken*. The pronunciation is also given, "shay-vay." Bow window is in French *fenêtre circulaire*, and in German *bogenfenster* (*bogen* an arch and *fenster* a window), pronounced "bogen-fenn-sterr," or *zirkelrunde fenster*, from *zirkel*, a circle, and *rund* round. Bridge is fully described—French *Pont*, German *Brücke*. In French a stone bridge is termed *Pont de pierre*, in German *Brücke von stein*. A wooden bridge in French is *Pont de charpente*, in German *Holzbrücke*. An iron bridge in French is *Pont en fer*, in German *Eiserne brücke*, &c. Gable is derived from the German *Gabel*, a fork; the French for the word is *Pignon*, pronounced "ping-yong." In German it is *Giebel*. Sash in French is *Fenêtre croisée*, in German it is *Fenstergerühme*. *Fenêtre à coulisse* is the French synonym for a sliding sash window. A lifting or vertical sash window is called *Fenêtre à guillotine*; a casement, or French window, is termed *croisée*. The French for sash-panes is *panneau de fenêtre*. Looking over the dictionary, we find that the technical building terms referring to workmanship and materials are pretty fully described, and their equivalents in French and German given; and if the accuracy of those we have referred to may be taken as a fair sample of the work throughout, we can congratulate the editor on the usefulness

\* Ward and Lock's Technical Dictionary of Architectural Design and Building Construction.

of his labours. The definitions are brief, and concisely stated. The definitions of building construction indicate generally a practical knowledge of the subject. As the French now the language of the civilised part of the Continent, and as the German methods of technical instruction are beginning to be adopted in our schools, Messrs. Ward and Lock's "Technical Dictionary" will be found of service to thousands of our artists and art workmen.

#### IMPERFECT ROOF-GUTTERS.

A LARGE yearly expense to owners of houses property arises from the repairs that become necessary to ceilings and roofs by the entrance of rain. If there is a gutter in front behind the parapet—a very usual form of construction—the front wall of the house becomes saturated, should there be any leakage. The wall papers of the upper rooms become disfigured by large spots of damp, which turn into mildew, or the paper peels off. The ceiling is also spoiled. The cause of the mischief will generally be found to be either bad masonry, or inferior workmanship—often both combined. The gutter is laid with zinc instead of lead, or the flashings are badly put in or turned into the joints of brickwork. Directly a hard driving rain sets in, the wet is driven behind the upturned lead or zinc and the gutters, and penetrates the brickwork or floods the ceiling. Patching is resorted to, but the remedy has to be repeated, and with worse results every time. The constant expense of these repairs becomes a serious reduction from the rental; yet we see hundreds of houses erected in the same manner, and long-suffering tenants enduring the discomfort and unsightliness of dampness above their windows. It is no one's duty to look after the gutters and roofs of houses "run up to let or sell. The edge of the lead gutter ought to be turned up, and the flashing made to cover it. The common mistake is in not giving a proper lead apron or flashing which hangs over the gutter; sometimes these are narrow pieces of zinc or lead insecurely inserted in the brickwork. Instead of being tucked into the joints quite 1½ in. or 2 in., well wedged in and cemented, they are roughly turned into the joint filled with common mortar, the lime of which destroys the lead and allows the water to enter. Cement is rarely used. Another equally common plan of preventing damp penetrating into chimney stacks on roofs is to form a cement filleting round the stacks. The cement cracks in a short time by the shrinking of the roof timbers or settlement, and the rain finds its way through the brickwork. Then there are bad samples of plumber's work: lead is not inserted as it should be round the brick chimney in the form of step-flashing, but slate flashings and other inferior kinds of checks are formed in cement. We have seen, too, lead on gutters and zinc flashings in defiance of the well-known fact that the two metals set up a galvanic action which soon destroys the latter. It is a pity that asphalt is not more frequently used for forming inside gutters; but it is useless to suggest new and better materials to builders so long as the under-bidding system prevails.

The church of St. Giles, Cripplegate, is now undergoing alterations and improvements. The chancel is being raised 9 in., brought further west towards the second column, and will be inclosed with a short light iron screen. The choir stalls are being brought more into the body of the edifice while the pulpit is moved in the same direction. The floors have been relaid. The work is being done under the supervision of Mr. Churchwarden Leonard Cubitt, by Messrs. Dove Brothers of Lothbury. The church will be reopened on Thursday, October 11th.

The village church of North Stoke, on the western slope of Lansdown, was reopened on Friday after restoration, carried out at a cost of £480. Besides the general repairs to the building the restoration includes new pews and pulpit, new east window, heating apparatus, new windows in nave, plastering internal roof of nave, new tower door, churchyard rails and gate, and new church furniture. Major Davis, F.S.A., of Bath, acted as honorary architect, and the contractors were Messrs. W. Cowlin and Son, of Bristol.

Gustave Gaut, the Viennese decorative painter died on Friday, aged 52 years.

## Building Intelligence.

**KIERLEY HILL.**—The new schools at Mount Pleasant, Quarry Bank, for the Kingswinford Local Board were opened on Monday last. They have been erected from the designs of Messrs. G. B. Nichols and Son, architects, Coleridge-row, Birmingham, by Messrs. H. Dorset and Son, builders, Cradley Heath. The buildings are planned for the accommodation of 360 children. The materials used are red brick, covered with moulded and other bricks. The walls of the rooms are partly open, the ceilings are painted, stained, and varnished, and are well lighted by large windows, the upper parts of which are fitted with Leggott's casement adaptors. The floors are laid with wood block paving. Boyle's inlet ventilators are used, and there are also outlet and ventilating turrets in the roofs. The schools are heated throughout by hot-water apparatus, supplied by Mr. J. Stoddard, engineer, of Stourbridge. The lavatory fittings are of Macfarlane's manufacture.

**HARROGATE.**—The Bishop of Ripon laid on Friday the memorial stone of a new Church of St. Andrew at Harrogate. It is situated in St. Andrew's-place, and is being built from designs by Messrs. H. E. and A. Bown. The ground contains vestibule and entrance-hall (14ft. by 20ft., by 15ft.), and reading-room (40ft. by 15ft. 6in.). On the first floor is a conversation-room, with cloak-room. The lecture-room, on this floor, measures 40ft. by 25ft. 6in. (17ft. high, with open-timbered roof. These rooms can be thrown together, thus affording accommodation for 250 people. The basement is devoted to the use of the caretaker. The style adopted is Late Gothic.

**KILMAURS, N.B.**—The old parish church, built in 1403, has lately been demolished, and a new structure raised in its stead was opened on Sunday. During the demolition of the old building numerous hewn and carved stones, apparently taken from other buildings, were found in the walls. The old walls were taken down to the ground level and new ones erected on the old foundations. A tower rising to the height of 90ft. has been added, and in it will be a belfry and belfry. The seats are about the same in number as in the old church. For the benefit of former days a platform has been substituted, and a choir seat in front. The object of the rebuilding and improvements will be about £1,500. Mr. Ingram, Kilmarnock, was the architect.

**STOCKPORT.**—The new Technical School, the foundation stone of which was laid with much ceremony on Saturday, is being built from plans by Mr. George Sedger, of London, selected in competition, and is estimated to cost £11,000. The portion of the basement devoted to students is to be taken up by a lumber shop and classroom. On the ground floor, in the front there will be the secretary's office, the council chamber, a reference library, and a lecture-room. The bulk of the space on this floor, however, will be appropriated to the teaching of chemistry and dyeing. The upper floor will be an art school. One room in the front is to be used for machine drawing, another for modelling, and a third for painting. A long room at the side will be the elementary room, and in it space will be provided for students engaged in drawing from life. The style of the building is English Renaissance, carried out in stone and brick work. The site is in Wellington-road South, on land belonging to the Governors of the Stockport Grammar School.

**SUNDERLAND.**—The Hylton-road Board schools, Sunderland, were formally opened on the 6th inst. They have been built at a cost of about £8,000, and are planned to accommodate 1,300 children in four departments. The buildings are executed in brick with moulded dressings. The roofs are covered with Penhryn slates. The work has been carried out by Messrs. D. and J. Ranken, Stockton-on-Tees, Sunderland. Mr. R. Carter has been the clerk of works for the schools, which were designed by Messrs. Oliver and Leeson, of Newcastle.

An organ, built by Messrs. Vowles, of Bristol, was opened last week at Winford parish church.

## Engineering Notes.

**CAPUTH, N.B.**—The new bridge over the Tay, now being built to supersede the ferry at Caputh, will be finished and opened for traffic in about three weeks time. The bridge consists of three spans, each of the landward ones being 137ft., and the centre 140ft. long; the roadway has a breadth of 20ft.; and from the summer level of the water up to the bottom boom of the girders is a space of 15ft. The girders are of lattice type, and made of mild steel. The piers up to the water level are hollow cylinders filled with concrete, resting on a bed of coarse gravel 10ft. beneath the channel of the river, and thence up to the girders they are solid masonry. The floor is also steel of the ridge and furrow pattern, placed longitudinally, and supported by crossed girders. The steel floor is covered with asphalt, with a topping of gravel. The abutments on the banks of the river are of solid masonry, with stone pilasters. The structure was contracted for by Mr. William Arrol, and its progress has been under the personal supervision of Mr. Thomas Arrol. The cost has been £5,000.

**OSSETT.**—The Great Northern Railway Company is at the present time engaged in building a new town passenger station at Ossett, to replace the old one, which has long been inadequate; and, by the co-operation of the Ossett Local Board, new approaches are being formed. There will be a new and direct road from the Market-place, carried over the new station by a bridge, and continued towards Horbury. The new station is to be upon the island principle, with a platform 160 yards long and 31ft. wide. About half the length will be covered with a glazed roof, supported on cast-iron columns. The buildings will be in the centre of the platform, of wood and glass, and will be in three blocks, separated by wide passages. The surface of the platform is to be of concrete, with stone edges, and will be approached by means of a covered passage, 6ft. wide, leading on an incline direct from the new thoroughfare already mentioned. The fabric of the roadway bridge over the station is being built by the company. It will be 250ft. long and 30ft. wide. It is divided into four spans, including two of nearly 70ft. each, carried on iron girders, with corrugated trough flooring. The abutments and piers are in brickwork. There will also be twelve lines of rails under the bridge, besides cartways. The road, which the Local Board will provide, is about 1,000 yards long and 36ft. wide. The company's works are being carried out, under the direction of the district engineer, Mr. W. Kell, of Leeds, by Messrs. W. Nicholson and Son, builders, Leeds, and Messrs. J. Butler and Co., Stanningley—the latter firm executing the ironwork. The contractors employed by the Local Board are Messrs. Aliffe and Mr. E. Ellis, under the direction of Mr. Hirst, the board's surveyor.

A start has been made with the restoration of the well-known Mayor's Chapel on College-green, Bristol. The city council voted £2,000 towards the work, but in order to carry out all that the committee deem necessary, about £3,500 will be required, and the balance will have to be met by private donations. The contract has been let to Mr. W. H. Cowlin, and the work will be carried out under the superintendence of Mr. J. L. Pearson, R.A. It is expected to occupy about nine months.

On Tuesday week a park, the gift of the Duke of Devonshire to the town of Keighley, Yorkshire, was opened by Lady Edward Cavendish. The site was formerly known as the Devonshire Park Estate, occupying an area of 9½ acres. The work of laying out the land has been proceeded with under the direction of Mr. Kershaw, of Brighouse, and the cost so far has been between £1,000 and £1,200.

Mr. Charles C. Jones, M.S.A., of Charles-street, Cardiff, and Mr. H. W. Donnelly, of Dublin, have been appointed joint architects for new paper stores and envelope factory for Messrs. Cowan and Co., of Dublin, Ireland.

Mr. W. Oldham Chambers, F.R.I.B.A., has been nominated on the supreme jury of the Brussels Exhibition, and also as president of the pisciculture jury at the same exhibition.

## COMPETITIONS.

**COPENHAGEN.**—The corporation of this city invite designs for a new town-hall, the cost not to exceed £140,000. The design is to provide for an entrance-hall, a covered carriage approach and courtyard, assembly hall, magisterial offices, library, police-station, accommodation for resident officials, and a restaurant. The building is to be lighted throughout with the electric light. Designs are to be sent in by March 1, 1889, and for the three best premiums of £300, £250, and £200 each will be given. The corporation will then invite final drawings and plans with estimates of cost from the competitors selected. The successful competitor in the second competition will receive a sum of £500, and the others one of £160 each.

**FRIARS' SCHOOL, BANGOR.**—There were 124 competitors for this work, and the referee, Mr. Herbert Carpenter, is reported to have chosen 17, out of which recommended number of plans the governors selected six for the second competition, ultimately over-ruling the decision of the assessor by a majority vote of four in favour of including Mr. R. Grierson, an architect of Bangor, whose design, if we are correctly informed, was not among the series favourably mentioned by Mr. Carpenter. A correspondent hands us the following list of candidates as those selected by the referee for a final choice of six to be asked to prepare designs for the schools, each of which six competitors is to receive £20:—Mr. E. Burgess,\* Mr. R. Blomfield, Mr. C. Bell,\* Mr. R. Curwen, Mr. D. Colley, Messrs. Crickmay and Son,\* Messrs. Douglas and Fordham,\* Mr. Richard Davies,\* Mr. J. Fowler,\* Messrs. Giles and Gough,\* Mr. James, Messrs. Oliver and Leeson,\* Mr. G. D. Oliver,\* Mr. W. Barrett Smith, Mr. J. Slater, Messrs. Smith, Woodhouse, and Willoughby, Messrs. Weatherly and Jones.\* The candidates marked (\*) are specially commended.

**ROTHERHAM.**—The town council have selected and adopted from the twenty-three plans sent in by competitors for the market that under motto "Fireproof," which is by Mr. Archibald Neal, 19, East Parade, Leeds. The estimated cost of execution is £3,703.

## CHIPS.

The tower of Lym parish church is about to be rebuilt at a cost of £3,000 from the plans by Mr. J. S. Crowther, of Manchester. A tender was accepted on Friday last for the execution of this work.

Mr. E. H. Shorland, of Manchester and London, has just supplied his patent Manchester grates to the Cheshire Lines Railway Committee for their new station at Heaton Mersey, near Stockport.

The Grand Prix de Rome has been awarded by the Paris authorities to M. J. Tournaise, and prizes of the second category have been given to M. H. Sortais and M. E. J. F. Huguet. The first prize for sculpture goes to M. L. J. Conyers, and that for engraving to M. H. Leriche.

The Theatre Royal at Glasgow was reopened on Monday by Mr. Henry Irving, after having been redecorated and refurbished, works carried out by Messrs. Laurie and Son, St. Vincent-street, Glasgow.

The directors of the Exeter Theatre Company have formally adopted the plans by Mr. Darbyshire, of Manchester, for rebuilding their ill-fated theatre on the old site, the estimated cost being £6,000, inclusive of provision for furnishing and lighting by electricity. The old walls will be retained wherever possible, but the plan has been remodelled.

The tower of Berkeley parish church is being restored from designs by Mr. B. H. Ransford. Messrs. Gregory and Sons, of Berkeley, are the contractors.

The Sheffield school board have adopted plans by Messrs. Wightman and Wightman, of that town, for the new Manor school.

The memorial stone of a new school, which is being built by the Manchester School Board, in Waterloo-road, Cheetham, was laid on Monday. The new premises will accommodate over 1,000, at a cost of about £13,500. Mr. H. Lord is the architect, and Messrs. R. Neill and Sons are the contractors.

Healing Manor, North Lincolnshire, is now being remodelled, from the designs and under the superintendence of Mr. E. W. Farebrother, F.R.I.B.A., architect, of Grimsby.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (via Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

## NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLII., XLVI., XLIX., L., LI., LIII., LIV., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print. Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

ERRATUM.—In the article on "Carpentry and Joinery" last week, in the 3rd column, p. 299, where reference is made to Figures 2 and 3, it should be Figures 3 and 4 instead.

RECEIVED.—G. J. and Son.—S. A.—W. McF. and Co.—E. B.—W. P. Co.

A. G. (Watson and Co. or Stanley. Leave pawnbrokers' shops alone.)—A. T. (Measures Bros., Southwark-street, or Homan and Rodgers, Gracechurch-street; the other people you name are not up to much.)—R. AND SON. (Write the Falkirk Iron Company. You cannot do better.)—FIBROUS PLASTER. (George Jackson and Son, 49, Rathbone-place; their work is excellent always.)—BUILDER. (Have you tried Willing's copper letters? They are good and cheap. The things you mention stand no time.)—J. BARNES. (Sold up long ago; we had an execution in his place ourselves, and there were "no goods." If not a swindler, he was next door to it.)

## Correspondence.

## WORKMEN AND ANCIENT BUILDINGS.

To the Editor of the BUILDING NEWS.

SIR,—Our autumn recess has been enlivened by two interesting documents transmitted from No. 9, Conduit-street. One is headed "Hints to Workmen engaged on the Repairs and Restoration of Ancient Buildings"; the other, "Conservation of Ancient Monuments and Remains—General Advice to Promoters of the Restoration of Ancient Buildings." Both are endorsed with the impress of the Corporate Seal of the Royal Institute of British Architects, and both are signed by J. Macvicar Anderson, hon. sec., and William H. White, secretary.

I propose this week to deal with the first of the two documents, and invite the particular attention of my readers to the heading "Hints to Workmen"—not hints to architects, not hints to the foreman or clerk of works, not hints for the specification. The hints are subdivided into trades, and I will take the trades in the order in which they are printed, although that order is disorder, so far as custom extends.

I think that my daily experience of the British workman is as much as that of most architects, and much more than that of many, and I say at once, that the writer of these "hints" either does not know his business or the ways of the workmen, or he has ignored practice for maudlin precept. I entertain too high an opinion of Mr. Anderson and Mr. White to believe that they have any more to do with the "hints" than to subscribe their names; as a matter of fact, I do not know who wrote them, and I do not care.

The first trade is "Excavator," and amongst other hints he is told: "If you find old foundations, bases of pillars, ancient tombs, stone coffins, pavements, or other work which appear to be in their original place, do not remove, but carefully expose them to view." Is the excavator the man to know whether a base of a pillar or a stone coffin is in its original place? Is he to leave his digging to enter on an archaeological study as to whether the pavement is in its "original place"? And how he is to know—given his historical knowledge—that the old foundation is in its original place before he "exposes it to view"? I cannot imagine! He is, however, cautioned to expose them to view only when they appear to be in their original place. I should have thought the "hint" would run: Carefully expose all to view, and leave the distinguished architect and archaeologist to determine whether the stone coffin is or is not in its original place.

Again: "Do not permanently expose to view or to the air work which clearly was not intended to be so exposed." This is really ludicrous. The excavator is to dig, but he is not to permanently expose to the air; he is to determine the chemical properties of material, and to enter into the minds of his eight or nine century old father to know whether he meant this or that to be so exposed. I should like to see the foreman's face when he discovers the excavator at this little game.

The "hints" to the excavator are terminated by a piece of advice which, coming from a practical as well as artistic body of men, is simply appalling. "See that your drains are so managed as to draw the water from the foundations and not towards them." (The italics are those of the writer of the "Hints.")

Now, has the gentleman ever heard of the numerous examples of subsidence of foundations from this sole drawing off water from the foundations? Is he so hopelessly ignorant of his profession as not to be aware that the alteration of moisture in soils, such as would be caused by the draining he tells the poor excavator to perform, would be almost certain to lead to collapse of the structure? Fortunately, the excavator would not be the man to "manage" the drains at all, and the sooner a reprint of these "Hints" is issued, eliminating the last mentioned and perhaps the whole of those addressed to the "Excavator," the better for the profession, the better for the builder.

The next trade is the "Mason," and it would appear that he is the particular tradesman who is in the habit of "cleaning off whitewash." In doing this, however, he is to avoid the use of the tool, and study the best way of removing whitewash. Yes! I suppose the mason is the man (not the architect) to study how to clean off whitewash—at all events, the man who wrote the "Hints" as to this "cleaning off" does not know, and his hopelessly unintelligible two paragraphs distinctly prove it. "In removing broken or decayed work, do not take out any but such as is so far gone as to have lost all its original form; better have broken or half-decayed original work than the smartest and most perfect new work." Better have a broken and decayed three-legged chair which will in a few months bring to the ground its occupant than the smartest and most perfect chair of to-day, which will give pleasure to our posterity as the old one has to us. "Never remove or clean the old mossed surfaces." No! Let it accumulate moisture, so that the structure may be irretrievably damaged by wet rather than remove moss, notwithstanding that it will, in a few years, again appear in all its beauty of colour and effect.

"Ancient monumental remains are never to give way to new encaustic tile flooring, but are in every case to retain their old position." Can any "hint" be more ridiculous than this? The

rotten stone is to go to powder before our eyes, and trip up the congregation, rather than "encaustic" tile paving be laid down; but, however, tiles that are not "encaustic" be laid down.

After the "Carver" comes the "Plasterer," and in order not to weary my readers, I quote only one paragraph from it:—"It is absolutely necessary to take down the wall covered with old painting, it might be preserved in the following manner: the base of the wall might be carefully taken leaving only a thin piece behind the paint; this might then be backed up with cement pieces of large size inclosed in wooden frame. The painting might then be removed and deposited in a museum." Let us suppose a piece of painting, say 5ft. by 10ft. in area, been discovered under some plastering on the surface of a wall 3ft. thick.

The plasterer, not the mason, is to take down the whole of this wall till he gets to a thin piece behind the painting. What becomes of the original masonry which these "hints" have been so careful to preserve? Do the gentleman who wrote this learned paper care of a little matter called *bond*? Does he think that the plasterer can approach within a piece (whatever that may mean) of the real surface without the risk of destroying the whole of the painting and perhaps the structure too? This "hint" is absolutely irritating from the grossness of the ignorance which displays.

The "Carpenter" follows the "Plasterer," and after some sentimental bosh addressed to the architect who does what his foreman tells him to do, is told: "Do not as a general rule take a roof off to repair it, but rather repair it in place bay by bay, and only in the spring and summer months." This "hint" is, to a builder, really invaluable, and the writer of it here eternal thanks. It is this kind of advice which gives our Royal Institute its *raison d'être* to this practical education, combined with a glimpse it affords into the higher branches of our art, which makes me rejoice greatly to have paid my last subscription, and so been possessed of a "hint" which is simply priceless.

The Joiner is to adopt the same general line as are laid down for the Carpenter, and is told, in addition, to "preserve ancient seating in its proper place, if possible." Yes! the joiner the man to determine that ancient seating is in its proper place; but suppose that he should think that it is not in its proper place, and the architect or churchwardens should think it is? I suppose the architect and churchwardens would have their way; and then it becomes of the "hint"? This should be carefully considered in the second edition.

The hints to the Glazier, Painter, and Stonemason are to the point, and will not do harm. This is because the directions are general, and do not involve much knowledge of work and the way in which it is done; and after an address to contractors and workmen in general, in language with which we are now all familiar, which may or may not be the outcome of special knowledge, these "Hints to Workmen" close.

Now, Sir, I am a member of the Royal Institute of British Architects, and a desirous as any that it should be in every way worthy of its position. I have frequently been reminded that we are, in the eyes of the public, a body of practical men with educated notions, possessed of great constructive ideas, and thoroughly able to direct workmen, men, and builders. I can only trust that for the sake of this reputation, these "Hints to Workmen" as coming from the R.I.B.A. never get into the hands of the public. I have only hastily skimmed over the paper; I have not the least hesitation in saying that the literary production of an educated body almost beneath criticism, and that as addressed to workmen it is contemptible.—I am, &c.,

WM. WOODWARD.

7, Duke-street, Adelphi, W.C.

[We think so, too. Our conviction is just as Daniel Defoe wrote "The Shortest Way with the Dissenters," so Lord Grimthorpe, some other pleasant master of sarcasm dictated or penned these "Hints," and in a mysterious way caused them to be issued under the sanction of the sages in Conduit-street, Ed. "B. N."]

STRAINS.

—Mr. Middleton, in his letter which appeared in your last issue, instead of attempting longer to prove the truth of his new theory of shearing stress, or to disprove that of Rankine and every other writer on the subject, confines himself to two statements, both of which are equally incorrect.

1. He says that the fact of a beam built up of segments, with elastic joints, naturally gives the form of a string supporting equal weights at equal horizontal distances apart, if it does not prove his case, at least exposes the weakness of mine. How or why he does not care to suggest. Perhaps he fancies there is a tendency to shear between the two central points on the string, which might be quoted in favour of his theory; but, unfortunately, there is no such tendency.

2. Failing to read aright the very simple shearing stress diagrams in my previous letter, he says—"At each abutment, according to Colonel Seddon's reason, there would be no shear."

Now, my diagram purposely showed no abutments, but simply dealt with three upward and three downward vertical forces acting on a beam. (there should have been arrow-heads on the force lines to indicate their directions).

I thought to have been perfectly clear to Mr. Middleton that, in applying it to the case of a beam supported at three points and carrying three loads, the ends of the beam beyond the loads must represent the portions resting on the abutments, where there could not be any shearing stress; whilst the extreme forces, *a*, to *A* and *B* would represent the reactions, and the diagram areas adjoining them showing the shear from each abutment to the next. It is equal to the reaction at that abutment.

Closing this correspondence, I think it right to state that my only object in starting this was to save those who look to your columns for instruction from being misled into adopting a theory which no examiner would accept, and ever firmly Mr. Middleton may choose to stick to his own ideas.—I am, &c.,  
H. C. SEDDON.

—Under the above heading correspondence has appeared in your pages for several weeks, originating in a certain statement made by Mr. Middleton in his article of July 20th. It was an important statement on shearing stress, at variance with generally accepted theories, and put forth without any proof whatever. The following weeks naturally brought replies commenting on this, and on August 3rd another appears from Col. Seddon ridiculing the idea. On the 17th Mr. Middleton replies in a very impertinent manner, still adhering to his theory, without a particle of proof, and at the same time attempts to teach Col. Seddon shearing stress. On August 31st, therefore, Col. Seddon goes carefully through the whole with diagrams, and absolutely proves the recognised theory of shearing stress which Mr. Middleton attempts to upset. What was my surprise, therefore, to find in your issue of today a letter from Mr. Middleton, still adhering to his new theory. As before, he does not put forth a particle of proof of his first statement; but attacks Col. Seddon's letter, and fully misunderstands certain parts of it, and proves that there is a shearing stress in beams, at their abutments, a fact of which no one ever doubted. It will perhaps be remembered that Mr. Middleton proved to his own satisfaction that in a uniformly loaded beam, supported at the ends, there is a shearing stress  $\frac{W}{4}$  at the centre, whereas Col. Seddon proved it to be nil. This is the point now under discussion. Mr. Middleton does not seem to know that there are other ways of proving the same fact, and on totally different grounds.—I am, &c.,  
FRED. G. EDWARDS.  
20, Leighton-road, Kentish Town,  
N.W., Sept. 7.

—I am not in the least inclined to pin my faith to Mr. Middleton's views, with which I don't agree; but though Col. Seddon's position almost gives him the right to speak *ex cathedra*, it is no refutation of Mr. Middleton's story to snub him for "attempting to fly in the face of the whole engineering world." The usual theory is summed up in two rules

on page 18 of "Wray." The first, relating to beams fixed at one end, is not under dispute. The second is as follows: "In the case of beams supported at each end, the shearing stress at any section is the difference between the reaction at either point of support, and the total weight lying between that point of support and the section in question."

This is, I think, proved by the following considerations:

"Shear" is caused by two forces, the load on each abutment and the reaction at that abutment opposing, but not meeting each other. If they met, the result would be simply compression, but the reaction tends to pass the load (like the blades of a pair of scissors, to use the oft-quoted simile) either to the right or to the left. Therefore, there are two kinds of shear; and may I be permitted to save diagrams by calling the shear caused by reaction passing to right of load *R* shear, and to left of load *L* shear. These differences are indicated by arrows in "Wray."

Consider the case of a beam with a single load, *W*, in the centre. On the right of the load we have *R* shear =  $\frac{W}{2}$ ; on the left, *L* shear =  $\frac{W}{2}$ ; and where these two meet—i.e., under the load—they neutralise each other, and there is no shear at all. This has been overlooked by Mr. Middleton.

In the case of a beam with distributed load. Beginning at the left-hand abutment, we have *L* shear =  $\frac{W}{2}$ , diminishing uniformly to nil at the opposite abutment; but we must compound with this the *R* shear, which is =  $\frac{W}{2}$  at the right abutment, and nil at left, and this evidently contradicts Mr. Middleton's theory, for the result is as given in "Wray."

To illustrate the case of a beam with various loads, the following example is taken from an examination paper.

A beam *A B* 20ft. long, supported at both ends, is loaded as follows: (*a*) 8cwt. at 4ft. from end *A*; (*b*) 12cwt. at 8ft. from *A*; (*c*) 14cwt. in centre; and (*d*) 16cwt. at 15ft. from *A*. Determine the shearing at a point 6ft. from *A*.

The reactions are—

	At <i>A</i> .	At <i>B</i> .
Due to load <i>a</i>	= 6½	1½
" <i>b</i>	= 7½	4½
" <i>c</i>	= 7	7
" <i>d</i>	= 4	12
	24½	25½

Therefore, at the given point we have—

Shear due to <i>a</i>	= <i>R</i> 1½	
" <i>b</i>	= <i>L</i> 7½	
" <i>c</i>	= <i>L</i> 7	
" <i>d</i>	= <i>L</i> 4	
Total	<i>R</i> 1½	<i>L</i> 18½

—i.e., *L* 16½

By "Wray's" rule we have—

$$24\frac{1}{2} - 8 = 16\frac{1}{2}$$

Similarly we have—

Shear between <i>A</i> and <i>a</i>	= <i>L</i> 24½
" " <i>a</i> " <i>b</i>	= <i>L</i> 16½
" " <i>b</i> " <i>c</i>	= <i>L</i> 4½
" " <i>c</i> " <i>d</i>	= <i>R</i> 9½
" " <i>d</i> " <i>B</i>	= <i>R</i> 25½

This is beautifully shown by the graphic method, not mentioned by Mr. Middleton.

But suppose we are asked the shear directly under load *a*.

As before—

Shear due to <i>a</i>	= nil
" <i>b</i>	= <i>L</i> 7½
" <i>c</i>	= <i>L</i> 7
" <i>d</i>	= <i>L</i> 4
	<i>L</i> 18½

This case is not provided for by the rule. The result above evidently = reaction — proportion of load *a* borne by abutment. So under *b* the shear will be found to be *L* 9½ under *c* *R* 6½, under *d* *R* 13½. Criticism on this last paragraph is earnestly desired.—I am, &c.,  
C. A. B.

LYDFORD CHURCH.

SIR,—A paragraph in your current issue announces that the chancel of this interesting church, on the borders of Dartmoor, is to be re-

roofed and restored from plans prepared by W. S. Hooper, of Hatherleigh. Some years ago the late Sir Gilbert G. Scott, R.A., by request, made plans for the renovation of this church; and sometime afterwards the late Mr. G. E. Street, R.A., also did the same thing. I believe it is no secret that the two sets of plans, although not carried out, were detained, but never paid for! More latterly, a Midland architect prepared fresh plans for the long-talked-of work of renovation; but so recently as June last these proposals were thrown overboard "for want of funds."

Can the paragraph in question be quite correct, therefore? More folks than the writer on this point feel somewhat CURIOUS.

ARCHITECTURAL PLAGIARISM.

SIR,—I notice by your Correspondence column that there is yet life in the above topic. I am glad that this should be so. For when the foundations of one's faith are being ruthlessly dug away, and that undermining operation elicits no active opposition, no powerful measures are taken to resist, then in such a case we may rest assured that faith does not exist—has long since been dead.

When "Evolution" enters the field with sharp-witted arguments as the opponent of Christianity, if the latter in its somnolence should remain inactive, and is at no pains to defend its principles, then is Christianity dead. And if when "idea" springing forth from the furnace of thought known unto man as "originality," sheds a light upon the crooked ways of plagiarists, the latter are found standing in arms to defend their principles, their ancient ways, then "plagiarism" is not dead.

Mr. Percival thought there was something—much, in fact—to be considered in my letter. Mr. Calvert does not. There are thinkers, and there are thinkers. The lower powers, I presume, are subject unto the higher. The "Culvert," the lower power, is subject unto the "invert," the higher. The one endures physical drudgery and, I presume, is happy, the other soars aloft, and metaphorises the vault of Heaven. So the plagiarist enjoys mental slavery, and his compeer towers above, seeks individuality of expression, and embodies in his composition self-sentiment. After this labour of genius the position becomes reversed, the higher powers have performed the drudgery and the lower step in to "copy"—merely to copy, to reproduce, to, if possible, reflect that which has been by colossal energy—they themselves know not even how—done.

How to obtain individuality? To be original or not to be original—that is the question. But the professional amateur has it—he is original without an effort. Lord Grimthorpe has impressed upon St. Alban's Abbey marks of individuality; there is to be seen the ponderous or legal style, and any style is better than none. And why copy? Mr. Waterhouse has a beautiful and well-proportioned tower subtending the National Liberal Club; displays geometrical conception, and is the expression of an elevated mind. This is built. Another tower, but not built, was designed by Mr. Statham and Mr. Slater, and appeared in the *Builder*, and exhibits poetical treatment, unconventional, untrammelled—it is essentially beautiful. It should have been built for the sake of the design. Here are three examples of individuality, and one is not—not professional. But why in the next competition should the first mentioned tower be constantly startling us with its reappearance, as if it had no owner? Why not let it rest undisturbed the sentinel of Northumberland-avenue? There is a wise, most wise, rule in vogue at the South Kensington Museum, and at all other art galleries—"The works of living artists are not, without their permission, to be copied."—I am, &c.,

CHARLES GUY HALL, A.R.I.B.A.  
12, Lower Phillimore-place, Kensington.

HADDON HALL PANELLING.

SIR,—As one of those described as "Vandals" who took part in the discussion recently at Haddon Hall, concerning the removal of the paint on the panelling in the ballroom or long gallery, before the "shocking treatment" which led to the "Hartshorne v. Oil" controversy, I am rather interested in the question,

taking Dr. Furnival's view of the matter, and thinking Mr. Hartshorne entirely in the wrong. No better evidence of his mistake could be mentioned than that afforded by the beautiful oak fittings in the chapel at Haddon, and also the woodwork in the apartment under the drawing-room, now known as the "dining-room," where the panelling and its carved enrichments have never been bedaubed with colour like the so-called "staining" on the wainscoting in the long gallery or ballroom,\* the hue of which the anti-scrapists seem to so greatly admire. The delicate moulded parts of the chapel fittings† were gilt; but no other colouring was used, and in the "dining-room," where the oak has grown grey with age, its surface remains as the craftsman left it. To my mind, this original treatment is so infinitely more interesting than the besmeared effect of the ballroom colouring, that I can hardly understand any one seriously objecting to the careful removal of the paint, especially as at best it only perpetuates the ignorant blundering of some workman employed to "do the place up" about the middle of the seventeenth century. The long gallery was built nearly a hundred years previous.—I am, &c.,

Sept. 12.

MAURICE B. ADAMS.

## SCOTTISH MASONS' MARKS.

SIR,—In your issue of to-day reference is made to a paper on this subject by Professor T. Hayter Lewis, F.S.A., in which he says:—"Many, if not most, of those strange marks had a definite meaning," and further on he alludes to "the great mind that was their pioneer."

Now, I don't think there is anything mysterious about these masons' marks. In his "History of Freemasonry in Scotland," Mr. D. Murray Lyon illustrates a number of these marks, and says: "There is no ground for believing that in the choice of their marks the 16th century masons were guided by any consideration of their symbolical quality, or of their relation to the propositions of Euclid. . . . A large proportion of them represent the initials of their owners' names, and they are nearly all of a sufficiently simple character to permit of their being cut upon the tools of operative masons and the productions of their handicraft, or used as signatures by such as had not been taught to write."—I am, &c.,

Sept. 7.

W. P. BUCHAN.

## SHORTNESS OF THE EXPECTATION OF LIFE IN THE FIFTEENTH CENTURY.

SIR,—The following is a copy of an inscription taken from a brass in the village church of Sprotborough, near Doncaster:—

"Hic jacet Wills Fitzwilliam dñs de Sprotborough armiger et Elizabeth uxor ejus filia Thome Chalkorth, militis qui quidem Willms obiit apud Hathillan primo die mensis decembris a<sup>n</sup>i dñi millmo ccc<sup>o</sup> lxx. quarto et predicta Elizabeth . . . die mensis . . . anno dñi millmo ccc<sup>o</sup>."

The brass consists of two effigies, a knight and his lady, and below them the inscription in Latin, as I have given it. The fact that the date of the death of the knight is recorded on the inscription, while that of his wife is omitted, leads one to suppose, and no doubt correctly, that the effigies were erected by the latter to the memory of her deceased husband. The curious part about it is that although the knight died but one-and-twenty years before the close of the 15th century, the belief in longevity must have been so slight that it was calculated impossible for his wife to live into the succeeding century. Hence, although the day and month of her decease are entirely omitted, the blank spaces intended for them never having been filled in, still the cutting of the four c's, followed by the conspicuously-placed stop, was, no doubt, in the mind of the person who erected the brass the limit of her age.

Never having heard of a parallel case, and thinking that this may be of interest to antiquarians and others connected with monumental brasses, I venture to send you a copy of the inscription.—I am, &c.,

HENRY GILBERT GAMBLE.

Gainsborough, Sept. 10.

## QUESTIONS.

[9746.]—**Ownership of Drawings.**—I shall be glad if any of your readers would kindly give me information or quote any case or cases settled legally as to right of ownership of plans and specifications, more especially if estimates have been obtained; but through circumstances best known to the client the carrying out of the work has been abandoned or, at all events, postponed. I may say that my client has paid the usual half commission on the lowest tender received in settlement of my charges for work done; but the plans and specifications, which are in my client's possession, have not been returned, and the question arises whether I can legally demand the return of the plans in the event of his refusing to do so. It appears to me that my late client could employ another architect and carry out the work from my plans and specifications if disposed, who would probably be paid the other half of commission. This would seem unfair, as all architects are aware that by far the greater half of the work has been done, as also artistic and brain-power expended when the plans, &c., are made.—SUUM CUIQUE.

[9747.]—**Groining.**—Will anyone kindly tell me of any good book on groining, especially dealing with 16th-century woodwork and fan tracery, showing how the ribs are struck out and panels let in.—D. M.

[9748.]—**Ruins near St. Alban's.**—Will some of your readers give information about the ruined buildings in the neighbourhood of St. Alban's, particularly Goresmanbury, which I am told was formerly the residence of Sir Francis Bacon. There is a curious piece of work, apparently detached from the building, containing an statue of a man in armour. Any information will oblige.—ENQUIRER.

[9749.]—**Half-Timber Work.**—What is the correct way in which to describe the curves of radiating timbers in gable tops? Should they be concentric, or are the different pieces segments of the same circle?—M.

[9750.]—**Bargeboard.**—Perhaps some of your readers would kindly give a sketch of section through bargeboard and gable-end at A B on sketch, showing manner

in which bargeboard is fixed to purlin, and also showing the way in which these purlins are carried through timber work of gable.—M.

[9751.]—**Italian and French Renaissance.**—What is the best work on Italian or French Renaissance illustrating details of old buildings?—M.

[9752.]—**Highest Spires in South London.**—Can any reader give me heights of loftiest towers and spires in the metropolis, south of the Thames?—E.

## REPLIES.

[9700.]—**Quality of Woodwork.**—Mr. Stevenson seems to dispute my statements entirely respecting timber and deals, but does not give sufficient reasons for so doing. Does he mean to say there is no Memel timber in the market now? I know that I have purchased logs some years ago that were distinguished in the way I before stated, and although Mr. S. says there is no sorting now, he admits there are three qualities. He also disputes my statement that Petersburg deals are now the best for joinery and small scantlings. I still contend that in this I am correct, both in regard to durability, strength, and colour, especially where a varnished surface is required. His remarks on Archangel deals show that he can never have seen the old importations (which, unless far advanced in years, is very likely). They very nearly resembled pitch pine in colour and grain, being full of resinous matter, while the present samples are nearly white, and I am quite willing to admit that they are unfit for the purposes named, because, as I before stated, they are a spurious article brought in under a name belonging to a superior deal not now in the market. With regard to dryrot, I have known a good many floors that have suffered from this cause, and on investigation have found them invariably to have been from Swedish deals and foreign-sawn boards—in one case the boards had only been put down about a year. In similar situations Petersburg deal has not suffered at all. Many of the floor-boards imported will be found on examination to have a large amount of sap upon them, and are evidently outside slabs from logs cut up for other purposes, and will frequently twist after laying down. Then with regard to Swedish timber used for carpentry, I have seen many instances where, when used as joists, the ends have decayed in the walls within five years. Mr. S. says nothing about the inferior strength of Swedish wood. As he has undoubtedly good opportunities of testing it, let him do so, that we may compare with the experiments made by Tredgold and others in better qualities of timber. The old London architects were practical men, and would have all scantlings for carpentry cut out of Memel logs. I happened to be in the South of England about 48 years ago and saw a beautiful log of Memel being cut up into scantlings 3in. by 2in. I asked why they did not cut them out of 1lin. deals; the reply was "that it was to be used in works to be carried out under a London architect, and

both he and London architects generally insisted upon being out of logs of the best quality." Mr. S. continues makes admissions confirming what I have before stated where he speaks of Gronoff's St. Petersburg deals as Omega goods of first-class shippers. The first has always been held in high estimation ever since I can remember. Omega is also good, but I defy him to produce a receipt for importation of Archangel at all like that of 50 years ago.—DURABILITY.

[9740.]—**Headstones and Monuments.**—The query was put and has been replied to before, and our "Constant Reader" has seen it? By far the best modern work upon the above subject is "Ancient Sepulchral Monuments" (1887), by Messrs. Brindley and Weather, Its price is £3 3s., and it gives nearly 700 examples, drawn to scale. Cutt's "Sepulchral Slabs and Crosses," published by Parker (1849) is another reliable and useful, though not nearly so exhaustive, a book.—HARVEY HEMS, Exeter.

[9741.]—**Drainage of Country House.**—Leading the waste-pipe from a sink and that from a bath into the same trap that serves for the water-closet is not good sanitary work. It would be better to put up a blow-off ventilating pipe from the outer end of the disconnect trap to ventilate the 60ft. of drain between the cover tank and the house. If "Stack-pipe" sends me I address I will forward him some illustrated circular which will give him information on the subject.—W. BUCHAN, Glasgow.

[9744.]—**Surveyors' Institute Examination.**—I have received letters from several gentlemen who propose to sit at the above examination, evidently thinking that I do nothing but "coach" pupils for technical exams, generally. I hope these candidates will not consider me discourteous in not answering them, as my time is much occupied at present. I would refer "H. J. G." and others to the recognised tutors, Mr. Adams, City of London College, and Mr. Middleton, St. James's Hall. I find the Government competitive exams are quite enough for me to cope with.—JOHN R. SMITH.

[9744.]—**Surveyors' Institute Exam.**—"H. J. G." can obtain full particulars upon application to the secretary, 13, Great George-street. The course of study depends in a measure upon the sub-division of the candidate. If in the Building Section, a class in Quantity Surveying at the Birkbeck Institution, commencing October 2nd, would suit "H. J. G."; and if he cares to communicate with me, I may be able to give suggestions as to the other requisite subjects.—H. BUSHELL, 1, Finsbury-circ., E.C.

[9744.]—**Surveyors' Institute Exam.**—As far as I know, no regular classes are held for the above, and should advise "H. J. G." to trust to his own perseverance to master the various subjects. I presume it is his intention to enter for the Professional Associates' exam, next year; but the choice of a subdivision must depend entirely upon his past experience and the class of work he is at present engaged in. The Land Agency subdivision requires the most book-reading, and the Building the most practical experience. "H. J. G.'s" best course now, if he has not already done so, will be to obtain copies of the Rules and Syllabus (price 1s.), and if he will communicate with me again I shall be pleased to give him any hints, hoping to have qualified myself for doing so by my own course in April last.—RICHD. WATSON, Plymouth-road, Totnes.

[9745.]—**Varicose Veins.**—Having suffered for the last two years from this complaint, my experience may possibly be of some use to "Draughtsman." I was advised by a well-known medical man to use unbleached calico bandaging. This I tried for some time; but it did not prove satisfactory, there being practically no elasticity in the calico, and this caused great pain by indenting the flesh when the legs became swollen, as was always the case after quick walking or mounting. I then tried the bandaging which is to be obtained of all vendors of surgical appliances (a kind of stockinette material). This has a certain amount of elasticity, and the price is moderate. I, however, experienced inconvenience by the bandages slipping, brought about by the variation in the size of the leg, consequent upon alternately exercising and resting. I next thought I would try silastic stockings, although the doctor had advised me not to do so. I found the satisfactory for a short time, but they very soon showed signs of wear, and also contracted about the heels, caused by perspiration, I think. The result was much pain, and before two months had expired I determined to abandon them. I have now returned to the stockinette bandaging, and I am quite sure, if properly put on (which, of course, can only be done after much practice), more support and comfort will be derived from this than from any other plan which can be adopted. When efficiently bandaged, one can stand about all day with but slight fatigue; whereas without this aid I could not venture out for an hour with any degree of comfort, and should return done up, as I have done on one or two occasions when I fancied I was in good condition and could do without the bandages.—VARICOSE.

The excavations made on Saturday in the ruins at Bow Castle, near Gals Water, Berwickshire, have revealed the fact that it is built over a most ancient broch, having walls of dry stones 18ft. 6in. in thickness, and inclosing an open space 82ft. in diameter.

The foundation-stone of the new church of St. Dyfrig, in Temperance-town, Cardiff, was laid on Tuesday. The building will be of simple Gothic character, and will have gabled aisles. At present only the first section will be built, and for this the tender of Mr. F. S. Lock, of Cardiff, has been accepted at £3,500. The architect is Mr. John D. Sedding, of London.

The parish church of Hamilton was reopened for worship on Sunday, after undergoing considerable internal alterations and redecoration. The work has been carried out under the direction of Mr. J. L. Murray, of Heavyside, architect.

## LEGAL INTELLIGENCE.

**RE J. P. FLEW.**—At the London Bankruptcy Court, on the 5th inst., the first meeting held of the creditors of John Pearce Flew, of 10, Edith-road, West Kensington. The debtor in business about sixteen years since in partnership with H. Gibbs, as Gibbs and Flew, and in the business was turned into a limited company under the title of Gibbs and Flew (Limited), Mr. Gibbs retired. The debtor returned liabilities at about £190,000, the bulk of which were secured; and there are also said to be mortgages to the amount of £500,000 outstanding in favour of the late firm of Gibbs and Flew. The debtor went into bankruptcy.

**SURVEYORS' VALUATIONS OF LAND.**—The agencies of the surveyors' figures in the compensation case of Bradshaw v. Cheshunt Local Board are somewhat remarkable. Mr. Bradshaw, it be remembered, brought a claim against the Local Board for injury caused to his freehold land at 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000.

## WATER SUPPLY AND SANITARY MATTERS.

**EDINBURGH AND LEITH.**—A joint meeting of the committees of the Corporations of Edinburgh and Leith, on the question of the drainage of the Leith district was held on Monday. The meeting considered a report prepared jointly by the engineers of Edinburgh and Leith, and Messrs. D. and T. Stevenson, C.E., containing proposals for the drainage of the Water of Leith, from the bridge to the sea, at an estimated cost, exclusive of wayleaves, &c., of about £65,000. It was unanimously resolved to recommend the Corporations to approve of the scheme, and to authorise the committees to have the necessary plans and parliamentary notices prepared.

**SALTASH WATER SUPPLY.**—The town council of Saltash, at a meeting held on the 4th inst., unanimously resolved to adopt the scheme submitted by Mr. H. Bertram Nichols, A.M.I.C.E., of Grosvenor Chambers, Corporation-street, Birmingham, which was selected from an open competition advertised for some months previously, and Mr. Nichols has now been instructed to prepare the necessary plans, &c., to lay before the Local Government Board, so as to facilitate the immediate construction of the works. It is a gravitation scheme, the sources of supply being perennial springs at Trematon, situated about three miles from the borough of Saltash. The water has been analysed and found to be of exceptionally good quality for domestic purposes. Two storage reservoirs are proposed to be constructed at Trematon, and a line main conduit will convey the water to a covered service reservoir near the borough boundary, at the high part of the town, from which point distribution mains with the necessary appendages will be laid throughout the town. Arrangements have been made for the purchase of the necessary land, easements, and water-rights, the town council having appointed Mr. Nichols to represent them as arbitrator in the matter.

The town council of Colchester received at their last meeting a letter from the Mayor, Mr. J. N. Axman, offering to present to the town a bas-relief in marble, representing the opening ceremony of the International Exhibition of 1881, and executed by Count Odsfredi, of Milan. The bas-relief was exhibited at the recent Anglo-Danish Exhibition. The town council accepted the gift with thanks, and the bas-relief will be placed in the quadrangle of the Museum, under a glazed front, and, eventually, should the Town Hall be enlarged as proposed, it will be removed to that building.

Alterations have been made at the Grand Hotel, underland, embracing the ventilation, which is now carried out on the Boyle system, the latest approved form of the self-acting air pump ventilator being adopted for the extraction of the vitiated air.

## Our Office Table.

ACCORDING to Mr. John Brett, A.R.A., Sir J. C. Robinson is very late in announcing to the world that water-colours are often injured because the paper on which they are executed contains traces of the chlorine employed for bleaching the material. The discovery was made about 1854 by the late Joseph D. Harding, the landscape painter, who introduced a new sort of drawing paper known by his name and stamped with his initials. It was made of pure unbleached linen, finished with a slightly twilled surface, and containing very little size.

We note with pleasure a new drawing-pen, manufactured by Mr. H. C. Miles, of Clarence-road, Clapton, whose patented invention, like most other really useful adjustments, is exceedingly simple, and consists in a small arrangement which prevents the instrument becoming disabled through loss of the adjusting screw, at the same time allowing the free use of the pen in the ordinary way. It likewise permits the lifting up of the blade of the jointed pen for cleaning without the removal of the screw, and every draughtsman knows from experience how often loss of time results from the necessary hunt on the floor for the screw of his pen should it chance to roll off the board, or be knocked down, as not unfrequently happens. There is another advantage, too, to be noted in this pen, and it is that no spring is necessary, because the nut serves to regulate the nibs either way, and with the utmost nicety. The addition to the cost is merely nominal, and any drawing-pen can be fitted with the new screw.

## MEETINGS FOR THE ENSUING WEEK.

**TUESDAY.**—Glasgow Architectural Association. "Recollections and Reflections," by T. Gildard, hon. president.

## STATUES, MEMORIALS, &amp;c.

**BRISTOL.**—The statuary for the High Cross at Bristol, recently re-erected in the centre of College Green, is being executed, under the direction of the joint architects, Messrs. Hirst and Paul, of Bristol, by Mr. Harry Hems, of Exeter. The material used is well-seasoned Box-Ground Bath stone, and the Bath Stone Firms (Limited), from whose quarries the seven blocks were raised, have given especial attention to the selection of the material. The seated statues of King Henry VI., which will be placed in the niche facing eastward, and that of Queen Elizabeth, who will face west, are now all but complete. Carefully-studied drawings, by the architects and sculptor, have been prepared at Stourhead from the original statuary, and the *motif* of these is being very closely followed by the sculptor. Both figures wear crowns, and the Virgin Queen has about her neck a ruff of the period. Besides these two statues there are to be seated figures of King James I. and Charles I., and erect ones of Henry III. and Edwards III. and IV.

The dean and chapter are about to restore the chapter-house of Lincoln Cathedral, at a cost of at least £7,000. An excellent likeness of the Bishop of Lincoln, in his mitre, has been placed as a corbel near the north-east entrance of the cathedral. The committee for the erection of the Bishop Wordsworth memorial, executed by Messrs. Farmer and Brindley from designs by Messrs. G. F. Bodley, A.R.A., and T. Garner, have just published their report, showing that the total was £2,150. The memorial was illustrated in our issue of May 18 last.

The town council of Selkirk have received the gift from Mr. Craig Brown, of the old prison, for use as a free library. All the necessary alterations to fit the building for its new purpose have been made by the donor, who will also pay the cost of maintenance for two years.

At a meeting of the Clew-with-Weelsby School Board, held on Wednesday, Sept. 5, plans for new schools for 1,000 children, arranged on the central-hall system, were approved by the Board. Mr. E. W. Farebrother, F.R.I.B.A., of Grimsby, is the architect.

The first sod in connection with the Belfast Main Drainage Scheme was cut on Wednesday by the chairman of the Town Improvement Committee of Belfast. The work will be the most costly undertaking ever entered upon in Ireland, the outlay being nearly £300,000.

## Trade News.

## WAGES MOVEMENTS.

**LEEDS.**—The carpenters and joiners' strike which has been in existence for ten weeks, ended on Friday night, the men accepting the terms offered them by the Leeds Master Builder's Association—viz., that carpenters' and joiners' wages be at the rate of 7½d. per hour for skilled workmen, time and a quarter to be paid for the first two hours' overtime, and time and a half for every subsequent hour.

## CHIPS.

A new Episcopal church was formally opened at Lochearnhead, on Sunday. The chapel is built of the grey whinstone of the district, with red sandstone dressings from Dumfriesshire, while the roofs are covered with dark blue slates from Lord Breadalbane's quarries, and are finished with red tile ridge cresting. The little narrow mullioned and cusp-headed windows are filled with quarry glass, having coloured borders. The work has been carried out from designs and under the superintendence of Mr. George T. Ewing, of Crieff.

Mr. Donald Robertson, formerly master of Smith-street Branch School of Art, Birmingham, has been appointed head master of the Walsall School of Art.

Some Roman remains—which appear to be those of a palace of a prætor—have just been excavated in a field a mile north of Llantwit Major, under the direction of Mr. John Storr, the curator of the Cardiff Museum. The fragments found include the base of a column, considerable portions of tessellated pavement laid in wheel patterns, pieces of Samian ware, human and equine skeletons, and Roman coins of Victorinus, Constantius Chlorus, and other emperors.

The foundation stone of All Saints Church, Rockwell Green, near Wellington, Somerset, was laid on Monday. The building will be Early Decorated in style, and will be seated for 450 persons. Mr. J. Spencer Houghton, of Taunton, is the architect, and a contract has been accepted for erecting the building, with the exception of the tower, for £2,765.

A new organ, built by Messrs. Willis, was opened last week in the parish church of Quedgeley, near Gloucester. It has been given by Colonel Curtis Hayward, and an organ-chamber has been provided by the parish.

At Gosforth, near Newcastle, new Board schools, erected from plans by Mr. W. Bedington, of that town, were opened on Monday. They are Queen Anne in style, are faced with red brick and stone dressings, and accommodate 200 children.

Stirling-road Wesleyan Chapel, Birmingham, was reopened on Sunday, after being decorated by Mr. Teall, of Nechells, and renovated from designs by Mr. E. Harper, Colmore-row, Birmingham.

Corner-stones of a Masonic hall, which is being erected at Kirkburton, near Leeds, at a cost of £1,200, were laid on Saturday with full ceremonial. Brother J. W. Cocking, the W.M. of the lodge, is the architect.

**Holloway's Ointment** is not only fitted for healing sores, wounds, and relieving external ailments, but, rubbed upon the abdomen, it acts as a derivative, and thus displays the utmost salutary influence over stomachic disorders, derangements of the liver, irregularities of the bowels, and other intestinal inconveniences which mar man's comfort.

## DOULTING FREESTONE.

**THE CHELYNCH STONE.**—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

**THE BRAMBLEDITCH STONE** is of the same crystalline nature as the Chelynych Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agents:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

## HAM HILL STONE.

Greater facilities have been provided for working these Quarries and the Stone can be supplied in large quantities at short notice. Prices and every information given on application to

**THE HAM HILL STONE CO.,**  
NORTON, STOKE UNDER-HAM, SOMERSET.  
London Agents:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

**HYATT'S LENS and "SEMI-PRISM"**  
LIGHTS for PAVEMENTS, STALLBOARDS, ROOFS, &c.  
TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

**WM. OLIVER & SONS,**  
**MAHOGANY, WAINSCOT, WALNUT,**  
**TEAK, VENEER, and FANCYWOOD**  
**MERCHANTS,**  
 120, BUNHILL ROW, LONDON, E.C.  
 The most extensive Stock of every kind of  
 Wood in Planks and Boards, dry and fit for  
 immediate use.

### TENDERS.

\*.\* Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

**ARNOLD.**—For making, metalling, and channelling Portland-street, Arnold, near Nottingham, for the Arnold Local Board of Health. Mr. F. Jackson, C.E., 18, Low-pavement, Nottingham. Quantities by the engineer:—

Messom, F. ... ..	£287	0	0
Frost, W. ... ..	259	12	2
Greaves, J. ... ..	217	12	0
Cope, E. ... ..	211	3	0
Raynor, A. ... ..	210	3	2
Holmes, R. and G. ... ..	200	0	0
Hawley, J., and Son ... ..	195	0	0
Cordon, W., Burton Joyce, near Nottingham (accepted) ... ..	179	6	0

Engineer's estimate, £211.

**BECKENHALL.**—For the erection of cottages, for the Right Hon. Viscount Portman. Mr. G. B. Jewell, M.S.A., Yeovil, architect:—

Poole, A., Ilminster (accepted).

**BERMONDSEY.**—For providing and fixing new hot-water tanks at the Tanner-street Workhouse, for the Guardians of the St. Olave's Union. Messrs. Newman and Newman, 31, Tooley-street, London Bridge, architects:—

Bullers, J. ... ..	£55	0	0

## To Municipal Authorities, Engineers, and Surveyors.

# JENNINGS' PATENT URINALS

FOR PUBLIC THOROUGHFARES AND RAILWAY STATIONS,

Have been adopted in all the principal European Cities. They are particularly adapted for public use, being simple in construction, strong, and most economical as regards the water supply.

## JENNINGS' STONEWARE DRAIN-PIPES

Have been specially selected and adopted, after severe tests, by the South Australian Government for the drainage of Adelaide. The Sockets and Pipes are made in one piece under great pressure by Steam Machinery from the finest selected Poole Clay taken from Beds on the works, and, by hydraulic testing, have been proved superior to any other pipes in the market.

Prices and particulars can be obtained from

**GEORGE JENNINGS, STANGATE, LAMBETH, LONDON,**  
 And the Manager, South-Western Pottery, Parkstone, Poole, Dorset.

# SHORT-TIME CONTRACT

CAN BE CARRIED OUT EASILY BY USING OUR LAMPS.

YOU CAN

## WORK ALL NIGHT

At much Less Cost than by Gas. No Steam or Air-Pumps required.  
 Entirely Self-Contained. Very Cheap.

# THE BUILDING NEWS AND ENGINEERING JOURNAL.

VOL. LV.—No. 1759.

FRIDAY, SEPTEMBER 21, 1888.

## SEASIDE RESORTS AND THEIR ARCHITECTURE.

THE projectors of new watering-places have scarcely entertained any other idea than drawing a number of holiday-making people to the seaside by amusements of a varied but very ephemeral nature. They imagine that a new pier, a pavilion for music, a few hotels, and a switchback railway are all that are necessary to equip an embryo seaside resort. A company is started with capital sufficient to set the place afloat. One or two hotels are erected facing the sea, and a plan is prepared and largely advertised by perspective views highly coloured, showing rows of neat villas, single and semi-detached; a church, of course with a lofty spire; a marine parade, tennis-grounds, and pavilions interspersed with ample gardens and foliage, and surrounded by a landscape of unequalled attractiveness. We can point to a very admirable and naturally favoured place not far from Southsea, in which all these attractions were shown by the early promoters, but which to this day is still half-finished, if it is ever destined to attain the popularity its salubrity deserves. On the Kentish coast more success has attended the starters of at least one new resort. We may name Westgate-on-Sea as a select suburb of Margate. A capital being subscribed, it has not been difficult to make a beginning by an enterprising company by the aid and patronage of a great landowner. Eastbourne, we know, has thriven from the local and moneyed interests which one great landlord has thrown into the scale. Other places do not appear—although possessing like natural advantages—to have gained the same popularity. It is from no lack of energy that they are comparatively little resorted to by the general public. They have been pushed, well advertised, and a fair stock of attractions have been provided. Why is it we find one resort declining and another not far distant rising in public estimation? The natural advantages and facilities of both are about equal as regards their distance from great commercial centres, and the means of communication to each are good. The answer must be looked for in the manner the new town has been laid out—in the general scheme of building, engineering, and architectural treatment. In several new watering-places we know the natural peculiarities have been entirely neglected; the physical features have scarcely been considered in the general laying out of the roads, terraces, and esplanades; they have been allowed to break out here and there with abruptness, and natural scenery and building have been brought into strange and violent contrasts. Skegness, on the coast of Lincolnshire, is one of those places where the modern builder has unmistakably set his stamp on the locality. Flatness is the prevailing character of Lincolnshire scenery, as all know who have visited the Fens. Nature has divested the country of all the features most favourable to a resort, save the fine seaboard that skirts the land to the eastward. The straight rows of houses which form the lines of the streets and terraces only partially erected add to the monotony and intensify the flatness and level lines. It did not occur to the designers that there was one way to produce a little diversity to the scene by avoiding straight lines on plan, and building the houses in curved lines and in crescents. The curves would have broken the straightness by varying the ground and

sky lines. Yet, not only in the plan of the streets has the straight line been introduced, but in the level roof-lines and continuous ridges, and so the evil has been rendered still more objectionable and disagreeable to the eye of the visitor. Nowhere do we observe the gabled or broken roof, which is the construction best suited to flat, plain-like localities. The parallel span roof abruptly terminates with gable ends. Then, in Skegness, all the buildings are of red brick, and of a hackneyed kind of architecture. There are very few houses in which any attempt is seen to give variety to the windows or the dressings. The balcony and bay window are inadequately treated. All is of the most commonplace character. The abrupt rows of houses leave unsightly gaps in the streets, rendering it impossible to follow out any plan of arrangement. The sea-front is thus patchy and disjointed; but there are some compensations for the dullness of the town, with its flat lands behind, where there are neither hedgerows nor trees, chimneys nor smoke, to break the horizon. There is the splendid pier constructed by a company in 1881, with its fine pavilion on the spacious head, rivalling in length even that of Brighton, and there is a magnificent sandy beach extending for miles along the sea. To the visitor these advantages do not altogether make up for the want of good planning and lack of rural surroundings which are so conspicuously noticed here. The building has spoiled the town irretrievably. The conclusion to be drawn is that the plan and conditions of building in new seaside towns have much to do with their success. Architectural conditions ought to have far more consideration than they usually have. We do not mean that it is necessary to have high class or even good architecture, that the houses should be either in this or that style; but only that the physical features and conformation of the locality should be studied with reference to the plan of the streets, and that in the design of the rows and terraces such features as roofs, and the materials to be used in the building, ought to be decided with special relation to the natural surroundings. Skegness might have been made more pleasing if the builders had been required to gable and hip their roofs, and if there had been a regulation that long, straight-eaved roofs of slate would not be tolerated, and that red brick must be varied by stone, white brickwork, or half timbering and stucco. Other towns take their example from what has been already done near them. Thus it is to be feared that the neighbouring watering-places of Sutton-on-Sea and Mablethorpe will be sacrificed to the intolerable cheap speculative builder style of straight-slatted roofs and red brick, if some one does not show that even a flat and uninteresting country can be made agreeable by its buildings.

Bournemouth has been spoiled by the red brick craze; but its undulations have happily prevented anything like uniformity in the buildings. Brighton has been marred in the newer western parts; but its undulating downs have compelled the builder to follow them. So with Clevedon. Westgate-on-Sea and Birchington indicate what can be done by tasteful villa building, and the avoidance of the straight, continuous line of buildings, a tendency which has spoiled nearly half our new seaside places, except where nature has made it impossible to be followed.

## LAND SURVEYING.—VIII.

### THEODOLITE SURVEYING.

HAVING explained the method of taking angles with the theodolite, it may be of service to the student if we show him the method of conducting the survey of a large district by means of that instrument and the chain. The preliminary proceeding is to

pole out the angles of the estate, those of the boundaries and roads, taking care that the poles can be seen from one station to the other. If there be any prominent feature in the centre of the land—such as a tree—reference to this object may be made in fixing upon any of the stations. We commence (plan 10) by chaining line 1 from the station A in the road, some distant object or tree being our guide. Before we proceed, the theodolite is planted on the station and put in adjustment, and an observation is taken to show the bearing of this line with the magnetic meridian. To do this the zero of the vernier and the 360° are set, and the upper part clamped, the needle is brought to 360° in box, the lower limb is clamped and the upper released, and the telescope is gently turned in the direction of the object, and the bearing recorded—say 25° west of north. Before proceeding with the chaining, it is useful to take another angle to any distant object. A large tree, which forms a centre object of the estate, is taken in this example, and the reading from line 1 to this object is 63°. From the same station turn the telescope to the flag or pole at end of line 14, and take another angle 58° with the last line. Having measured the angle at A, we may proceed with the chaining of lines 1 and 2. At the end of line 2 a good sight is obtained of the tree, and the theodolite is set up and the angle measured 91°. Angles may be measured also to line 8 and to line 3 before proceeding further. Lines 3, 4, and 5 are next chained. At the end of line 5 on the road a convenient point is obtained for taking two important angles. First, the angle between poles 5 and 6 may be measured (88°). Turning the telescope on pole at end of line 12 take the angle between it and the further tree, which reads 93°. Lines 6, 7, and 8 are next measured, taking up the fences, the boundaries of the land, and the winding of the river as we proceed. Between 7 and 8 in centre of road, the angle between these lines may be taken, also between them and the central tree, the angles measuring 92° and 74° respectively. This portion of the survey being so far completed, we return to station A, and proceed to chain lines 9, 10, and 11, chiefly along the roadway. Offsets taken at the ends of each chain line to the lines ranged to the tree, which pass on either side of the road, will enable its curvature to be plotted. The boundaries 12, 13, and 14 complete the outline, angles being taken to the tree at all convenient points, and between 13 and 14. The other lines to be chained will be observed by an attentive study of the plan. It will be noticed that there are four main triangles made by the radial lines to the centre tree, and that as the bases of these are measured and form the boundary lines, and two angles are taken to each, the other angle and sides can be plotted or calculated. At the upper corners of the plan, which is bounded by the brook, two other triangles can be formed by chaining lines, joining the extremities of the three upper radial lines, and by making one straight line instead of lines 1 and 2, a figure of an irregular hexagon will be formed which can be easily plotted and calculated. Taking the large triangle, of which one side is line 13, the angles taken at the ends 33° and 49° enable the position of the tree to be accurately determined; three things being known about the triangle, it can be solved in the way we have shown. But without calculation, the position of the tree can be found, for the intersection of the two sides will fix the point. The work can be proved easily by remembering that the sum of the two angles at the extremities of a chain line, subtracted from 180° will give the third or apex of triangle. By plotting the two angles accurately by a protractor, the third one should measure the reading in the field-book; if it does not do so one of the other angles must be wrong. In commencing to plot

the survey, lines 1, 2, 3, 14, and 13 should be laid off by the scale and protractor, taking care that the magnetic meridian is first drawn on the paper, and its angle correctly plotted with lines 1 and 14. The protractor used should be a large one; as we have said, 12in. diameter is not too large, as the angles can be more accurately pricked off.

Another method of surveying and plotting may be noticed. The boundary lines may be all taken in reference to the meridian, and the angles marked on the plan or field-book when chaining. For example, line 1 is  $25^\circ$  west of north, or  $335^\circ$ , line 14 is, say,  $95^\circ 30'$ , line 2 is  $10^\circ$  west, or  $350^\circ$ , line 3 is  $38^\circ$ , and so on. These angles are entered as we proceed. In plotting the survey circles can be described, as we explained in our last article, at each corner of the paper, and the chain lines can then be set out on them to the proper angles drawn through the centre of circle, and each line can then be drawn in parallel to its particular angle. For convenience parallel meridian lines can be drawn over the paper, and the chain lines are then more readily laid down. The smaller lines in the survey can be filled up by the aid of the sextant. In our plans we have avoided drawing too many tie lines which might be taken, those we have shown by the finer dotted lines being necessary in taking up the fences. Good tie lines would be the thick radial lines along the road, numbered 9 and 11, and line 16. The thick dotted lines on the plan show the radials to the centre object to which we have referred. It should be noticed that the main object of theodolite measuring is to avoid measuring chain lines through the ground; these are supposed to be difficult on account of obstructions. With a central object upon which angles can be measured from the boundaries, such through lines are not necessary. To prove the work the triangles can be calculated, or the sum of the interior angles taken. For this purpose all the chain lines and radials are first plotted from the field-book, the number, respective length, and angles being entered upon each, and if these are found to be correct, the fences, roads, and filling in can be drawn. The details of the survey ought not to be plotted till the main lines and boundaries are put in.

At the risk of tiring the student with the preliminary steps of taking angular measurements, we may refer again in a little more detail to the method of measuring the angles

station 3, and if the readings agree with the former, the angle between 1 and 3 may be assumed to be correct. To station 3 the instrument is then moved and put into adjustment. We here add  $180^\circ$  to the last bearing 2 to 3. Let us suppose this was  $30^\circ$ , then  $30^\circ + 180^\circ = 210^\circ$ . This addition is according to the rule, "If the original bearing is less than  $180^\circ$ , add  $180^\circ$  to it; but if more than  $180^\circ$ , subtract that sum from it for the back setting." Set the plates of instrument to  $210^\circ$ , and proceed as at station 2. In the same manner we proceed with the other stations of the traverse. Another method, though less expeditious, may be found by taking each angle separately. Placing the instrument on station 2, clamp the plates upon zero, and turn round telescope upon station 3, when the interior angle will measure  $114^\circ$ . Remove instrument to 3, clamp the plates upon zero, and read the interior angle, say,  $75^\circ$  to station 4. Proceed to station 4, and take the interior angle to 5, and so on. Thus it will be noticed the true bearing of any line will be found by adding to the original bearing the interior angle when a line bears to the left, and deducting the same when the line bears to the right. But this plan is open to the objection of being troublesome; besides which, the rule just stated may lead to inaccuracies in surveying a long traverse.

We have been reminded by a correspondent, with reference to our remarks on chain surveying of triangles, that no means are suggested for proving the accuracy of the lines of a triangle by taking tie-lines. Our readers will see by the observations we have made how essential it is to take as many tie or proof-lines as possible, and we therefore are glad to avail ourselves of our correspondent's remark that the field-book may record the length of the three sides of a

triangle, and yet, from a mistake in chaining one side, the plotting may be wrong. A mistake of one chain may be made, and there would be nothing to check it unless an angle were taken. But if a chain line be run across the triangle joining two sides at certain distances, and carefully noted, or from one angle to the opposite side, any discrepancy in the scaling discovered in the plotting of the tie-line will show an error has been made in measuring the sides. Therefore, the importance of taking a tie-line to every large triangle is obvious.

#### PRACTICAL ARCHITECTURE WITH DETAILED ESTIMATES.—XI.

By HENRY LOVEGROVE, F.S.I., Surveyor.

REMAINDER OF CARPENTER.

(Sheet omitted by accident.)

53. **TIMBER.**—All timber to be Dantzic, Riga, or Memel yellow fir of the best description and free from all defects—sap, shakes, large or loose knots, and sawn die square. The deals to be yellow Christiania of best quality and well seasoned.
54. **Generally.**—Provide all necessary timbers for stays, struts, ties, shores, &c., that may be required, centring for arches, turning pieces, rules, templates, and moulds.
55. **Plates.**—All plates to be  $4\frac{1}{2}$ in. by 3in., in as long lengths as possible, and to be lapped and carefully spiked at angles.
56. **Lintels.**—All internal openings to have lintels 1in. in depth for every foot of opening, none being less than 3in. in depth and not less than 12in. longer than the opening, and as wide as practicable.
57. **Distances.**—No timber to be nearer than 3in. to any flue, and no rafters, joists, or other timbers to be more than 12in. apart.

PLAN 10

of such a boundary as we have shown. Referring to Fig. 15, let the bearing 2—1 be  $276^\circ$  with the true north be supposed to be given, we have to find the angle between it and line 2, 3. Clamping the upper and lower plates of the instrument—using the tangent screw—make the vernier read the bearing. Turning the instrument gently round till the telescope points to station 1, make sure of the observation by clamping the lower plate and bringing the cross hairs to the foot of pole by the tangent screw. Then, unclamping the upper plate, turn the telescope gently round to station 3, and adjust the hairs in the same manner, after clamping the upper plate. Repeat again the operation by directing the instrument to station 1 and then to

76. *Staircase into Garden*.—To be framed in deal as shown, put together in white-lead and pinned with oak pins. The arched boards to be 3in. thick, and the floor to be formed with 4½in. by 1½in. laths to form lattice floor, wrought all round and nailed with galvanised iron nails. The outside laths to be 8in. by 1½in. The steps to be 1½in. thick and 10in. wide, wrought all round and rounded on front edges, housed into 10in. by 2in., wrought all round string. The balusters to be 2in. square, framed at both ends and turned. Sills 6in. by 4in., posts 4½in. by 4½in., with ornamental termination. Upper sill of oak 4 by 2½, wrought all round, sunk, and chamfered both edges, 4 by 3 oak wrought, framed, and moulded handrail framed into posts, the posts to be terminated by oak balls 4½in. diameter.

77. *Conservatory*.—The floor of the conservatory is to be paved with 6in. red tiles, laid and jointed in cement on concrete 7in. thick, filled in between joists. Case in the bressummer with 1½in. deals, and form a ceiling over part with 1½in. deals, wrought, tongued, matched and V-jointed, boarding with 4 by 3 moulded cornice. The sill to be 8 by 4 oak, stop sunk, weathered and throated with 1½ by 1-16 galvanised iron tongue, fitted in grooves in the stone sill. The posts at ends to be 6in. by 6in. fir, wrought all round rebated and beaded, with 7 by 7 do. at angles, and 6 by 6, the remainder 6in. by 4in., transom, 12in. by 6in. head, 12in. by 3in. deal moulding planted on, and 8in. by 4in. moulding do. The side-lights to be 2½in. with extra wide bars, hung on 4in. butts, and fitted with Elsley's patent rack fastening. The top of conservatory to be framed as shown, the spandrel to be filled in with 2½in. deal fixed lights. The door from drawing-room to be 2in. deal, the lower part in one panel moulded both sides, the upper part sashed for glass with extra wide bars in small squares, the top rail segmental. The door to be hung with 4in. butts and fitted with 6in. lock and two 9in. brass barrel bolts, 5in. by 4in. frame for door, 4in. grounds, and 4in. architrave. The door to garden to be similar to last, with 2in. fixed fan-light over, and 4in. by 3in. transom.

78. *Staircases*.—The stairs from basement to ground-floor to have 1½in. treads, with rounded nosings, 1in. risers, tongued glued blocks, and bracketed on strong fir bearers. The windows to be cross-tongued, the bottom step nailed. Framed 1½in. wall, and outer strings ramped and tongued at joints 4in. by 4in., plain newel with ornamental tops. Mahogany handrail as shown, 1½in. by 1½in. turned balusters, ¾in. beaded apron lining, and rounded nosing to landing to match treads. The stairs from ground floor to second floor to have treads as last, but with moulded nosing tongued on under the bottom tread, and riser rounded and veneered 1½in. cross-tongued quarter spaces on strong fir bearers; 1½in. framed and moulded wall strings with skirtings on landings to match, the outer string to be 1½in. rebated and moulded, capping and moulding planted on face, as detail; ¾in. apron lining with moulding planted on to match string; 1½in. moulded nosing and moulding under to match treads. Mahogany handrail as detail, 2in. by 2in. turned balusters; 4in. by 4in. newels, with ornamental top and pendants as shown. The spandrel framing to be 2in. moulded and square.

79. *Servery*.—The framing to servery to be 2in. moulded both sides two panels high with 2in. spandrel sash over. The door to be 2in. with diminished stiles, the lower part in two panels moulded both sides, the upper part sashed with stout bars in small squares hung with 4in. butts and fitted with 6in. brass mortise lock, black and brass furniture and finger-plates. The light over to be 2in. moulded, the framing to be formed with posts (see detail) properly framed and

studded to floor with transom moulding planted on (see drawing).

## FOUNDER AND SMITH.

80. *Eaves Gutters*.—All the roofs to have 5in. moulded heavy cast-iron eaves gutter, with red-lead joints on brackets and screwed to fascia. To have all necessary stopped ends, outlets, and angles.
81. *Down-pipes*.—All rainwater pipes to be 3½in. by 2½in. rectangular, with collars cast on and jointed with red-lead and tow, and securely fixed to brickwork. To have all necessary shoes, plinth, and other beads, and swan-necks.
82. *Grates*.—In the kitchen provide a kitchener with oven and high-pressure boiler £15 p.c., in the scullery a range £5 p.c., in the three reception-rooms to average £5 p.c., in two other rooms £1 each p.c., and the remainder 10s. each p.c.
83. *Chimney Bars*.—All chimney openings to have 2 by ½ wrought-iron chimney bars 18in. longer than the openings, the ends split and turned up and down.
84. *Handrail, &c.*—The steps to side entrance to have wrought-iron framed handrail and balusters.
85. *Girder*.—The girder to carry wall over dining-room to be of two rolled joists weighing 57lb. per foot run each.
86. *Bolts*.—Provide 2cwt. of straps and bolts to be used by the carpenter as will be directed.
87. *Coal-shoot*.—Provide and fix a frame and hopper for coal-shoot 1ft. 9in. by 3ft. 3in.
88. *Bells*.—Provide the sum of £15 for electric bells and fixing, including presses and indicators.
89. *Gas*.—Provide the sum of £20 for gas-pipes and fittings.

## FOUNDER AND SMITH.

The iron to be the best Staffordshire or equal thereto, and all castings to be smooth and perfect:—  
CAST IRON AND FIXING.

- 127ft. Run, 5in. moulded heavy eaves gutter, with proper lead joints on brackets, and screwing to fascia ..... £ s. d.  
No. 12 extra to stopped ends to do. ....  
5 " outlets do. ....  
2 " external angles do. ....  
1 " internal do. do. ....  
6 " obtuse do. do. ....  
158 " 3½in. by 2½in. rectangular rainwater pipe, with collars cast on, jointed watertight with red-lead and tow, and securely nailing to brickwork .....  
No. 5 moulded heads .....  
2 Extra to plinth bend in do. ....  
5 " to swan-neck do. ....  
5 shoes (purpose made about 30in. long) .....  
No. 4 register grates p.c. 10s. each and allow for profit and carriage .....  
No. 2 do. p.c. 20s. each and do. do. ....  
No. 3 do. with fire-brick backs and sides and tiles in front, p.c. £5 each and do. do. ....  
No. 1 range p.c. £5 and do. do. ....  
No. 1 kitchener with oven and high-pressure boiler, p.c. £15, and do. do. ....

## WROUGHT IRON AND FIXING.

- Cwt. qr. lb.  
1 1 7 In chimney bars with ends split and turned up and down and building in by bricklayer .....  
5 2 7 In framed balusters and newels .....  
15 3 Do. rolled iron joists and hoisting and fixing at about 12ft. from ground level .....  
2 Do. straps and bolts and fixing by carpenter to be used as directed (provisional) .....  
No. 1 frame and hopper for coal shoot 1ft. 9in. by 3ft. 3in. and building into wall .....  
Provide the sum of £15 for electric bells .....  
do do. £20 for gas-pipes and fittings .....  
Allow for attendance on bellhanger and gasfitter .....

## BELLHANGER AND GASFITTER.

Carried to summary ...

## PLASTERER.

90. *Materials*.—The whole of the plastering to be executed with the best flare-burnt chalk lime, clean, sharp sand, clean, long cowhair free from grease, and Baltic heart-of-fir laths of the quality known as lath and half, the ends to be butted, not lapped.
91. *Limewhite*.—Twice limewhite the whole of the basement walls which are not plastered; also soffits of arches and stone steps.
92. *Walls*.—Render, float, and set the walls of the breakfast-room, passage in base-

ment, and the whole of the walls and brick partitions on upper floors.

93. *Partitions*.—Lath, plaster, float, and set the partitions throughout.
94. *Ceilings*.—Lath, plaster, float, set, and twice whiten ceilings throughout; also soffits of internal staircases.
95. *Cornices*.—Run plaster-moulded cornices to design, and whiten to the rooms as follows: First floor rooms, 12in. girt; dining and drawing rooms, 24in. girt; library, 18in. girt; porch, bay window, and cloaks, 9in. girt; breakfast-room, 12in. girt; entrance hall, &c., 21in. girt.
96. *Portland Cement*.—The whole of basement, except where wood skirtings are described, to have beaded skirtings 6in. high.
97. *Keene's Cement*.—The internal arches, as shown, to be finished in Keene's cement, the angles, 1½in. diameter, staff beaded, the architraves 4in. and 4½in. respectively.

## PLASTERER.

Use the best flare burnt chalk lime, clean sharp river or pit sand, clean long cowhair free from grease, and Baltic heart of fir "lath and half" laths:—  
Yds. Ft. £ s. d.

- 379 Supl. Twice distemper plastered walls a plain tint, the colour fixed ...  
122 " Extra to fair face and twice lime-white brickwork .....  
3 " Do. do. point and twice lime-white soffit of arch .....  
4 " Clean down and twice limewhite soffit of stone steps .....  
1,208 " Render, float, and set walls .....  
55 " Do. do. narrow to circular soffit .....  
218 " Lath, plaster, float, and set partitions .....  
542 " Lath, plaster, float, set, and twice white ceilings .....  
17 " As last on soffits of stairs, a small part fueling .....  
30 Run. Labour to quirk .....  
26 " Plaster moulded cornice, 6in. girt, and twice white .....  
66 " Do. 9in. girt and do. ....  
57 " Do. 12in. do. and do. ....  
272 " Do. 18in. do. and do. ....  
113 " Do. 21in. do. and do. ....

## PORTLAND CEMENT.

- 11 Supl. Plain face on lath in panel .....  
118 Run. Beaded skirting 6in. high on brick No. 24 angles to do. ....  
8 housings " .....  
2 scribbings " .....

## KEENE'S CEMENT.

- 139 Supl. Plain face to jambs in narrow widths 6in. do. circular to soffit do. ....  
147 Run. Angle and aris .....  
46 " do. circular .....  
83 " Rounded angle .....  
No. 13 stopped ends to do. ....  
7 " 1½in. staff-beaded angle and double quirks .....  
22 " Do. circular .....  
No. 3 stopped ends to do. ....  
3 played do. do. ....  
58 " Moulded architrave 4in. wide .....  
65 " do. circular .....  
No. 10 stopped ends to do. ....  
4 mitres circular to circular .....  
52 " As last 4½in. wide .....  
49 " Do. circular .....  
No. 6 stopped ends to do. ....  
2 mitres do. ....  
2 square plinth blocks 18in. high, 5in. wide, and dubbing out for same. ....

Carried to summary .....

## PLUMBER (EXTERNAL).

98. *Lead*.—The lead to be the best milled lead, with all necessary tacks, wall hooks, and lead-headed nails.
99. *Gutters*.—The gutters throughout to be laid with 6lb. milled lead.
100. *Flashings*.—The flashings to be of 5lb. lead, to average not less than 5in. width, and step flashings not less than 12in. wide.

## PLUMBER (INTERNAL).

101. *Service*.—Lay on the water from the main with ½in. lead pipe, ¾in. brass driving ferrule to the cisterns. The cisterns are to be fitted with ¾in. brass ball valve and copper ball, all necessary brass unions, and 1½in. overflow.
102. *Cisterns*.—Provide and fix on strong bearers two wrought-iron galvanised cisterns, each to contain 200 gallons, one to supply the hot-water cistern and

water for drinking purposes, the other for w.c.'s, &c.

103. *Supply*.—Lay on the water from the above cisterns with  $\frac{3}{4}$  in. pipes, and  $\frac{1}{2}$  in. branches to the water-waste preventers, and  $1\frac{1}{2}$  in. pipes from these to the w.c. pans.
104. *W.C.'s*.—The two best w.c.'s to be Doulton's patent valve closet, £5 p.c., and the servants' w.c. to be £3 p.c., with 4 in. lead pipes from pan through walls to 4 in. diameter cast-iron soil-pipe, with socket joints caulked with red-lead and tow, and securely fixed, the pipe to be carried up above roof, and finished with Boyle's foul-air extractor.
105. *Safes*.—Form safe to the w.c.'s of 4 lb. lead and to bath of 5 lb. lead, with bossed angles and brass gratings.
106. *Bath*.—The bath to be of enamelled iron £5 p.c., including brass fittings, hot, cold, and waste 2 in. lead waste.
107. *Sinks*.—The scullery sink to be 3 ft. 6 in. by 2 ft. on two half-brick bearers, and the housemaid's sink to be p.c. 34s. in Doulton's list. Both to have  $\frac{3}{4}$  in. screw-down bib cocks for cold-water supply, and 2 in. lead wastes.
108. *Hot Water*.—Provide and fix in the roof as will be directed a wrought-iron galvanised hot-water cistern to contain 70 gallons, and connect with cold cistern with a short length of  $\frac{3}{4}$  in. lead pipe. The flow and return from cistern to boiler of kitchen to be 1 in. wrought iron, with all necessary joints, bends, and elbows (and painted four coats). Carry the water from the hot cistern with  $\frac{3}{4}$  in. pipe, and  $\frac{3}{4}$  in. brass hot-water taps over both sinks, and for draw-off in kitchen. Attend upon and cut away for the hot-water engineer.

PLUMBER.

Use the best milled lead dressed smooth, and include for hooks and all labour .....

- Cwt. qr. lb.
- 17 3 14 Milled lead and labour in gutters, flashings, &c., on roofs .....
- 0 2 0 Do. do. bossing to apex of octagonal knob .....
- 5 Run. Extra labour dressing 5 lb. lead over edge of flat .....
- 25 " Close copper nailing .....
- No. 1 bossed end to roll .....
- 3 soldered dots and screws .....
- 8 lead tacks and nails .....

WATER SUPPLY, &C.

The whole of the water supply to be executed in accordance with the Waterworks Company's Regulations .....

Give notice to the Authorities and Water Company and pay all fees legally demanded .....

Allow for taking up ground in road and tapping Company's main, and make good work disturbed .....

N.B.—The price for pipes to include all soldered joints except branch joints, which are taken separately .....

Cwt. qr. lb.

1 3 7 Milled lead labour in safe .....

- Ft.
- 25 Run. Close copper nailing .....
- No. 4 bossed angles to safe .....
- 156 "  $\frac{3}{4}$  in. strong lead service pipe, including bends, hooks, joints, and fixing .....
- 21 "  $1\frac{1}{2}$  in. do. do. .....
- 30 "  $\frac{3}{4}$  in. do. do. and digging trench for same and filling in, ramming, and levelling .....
- 17 " 2 in. lead waste-pipe, all as first .....
- 52 " 4 in. diameter cast-iron soil-pipe with socket joints throughout, caulked with red lead and tow, and securely fixed with proper wall hooks .....
- No. 2 soldered stopped ends to  $\frac{3}{4}$  in. pipe .....
- 6 do. branch joints to do. .....
- 2 pieces of  $\frac{3}{4}$  in. lead pipe about 2 ft. 6 in. long to supply water-waste preventer, including soldered joint to supply from cistern .....
- 1 do. about 8 ft. long, all as last .....
- 1 piece  $\frac{3}{4}$  in. lead pipe about 18 in. long, with one soldered joint to sink .....
- 2 do.  $1\frac{1}{2}$  in. do. about 6 ft. long for overflow .....
- 3 do. 4 in. pipe out of 7 lb. lead, about 4 ft. long, one end jointed to w.c. apparatus, the other to cast-iron soil pipe .....
- 1 3 in. brass grating and soldering to lead safe .....
- 2 in. " driving ferrule joint and fixing .....
- 2 in. " screw-down bib cocks do. and do. .....
- 2 in. " high pressure ball valves and copper balls to do. .....
- 2 in. brass stop-cocks do. and do. .....
- 2 in. " fly nuts and unions do. and do. .....
- 2 in. " do. do. do. .....
- 1 Boyle's patent foul air extractor, fixed to 4 in. pipe .....
- 1 iron collar as flashing to  $\frac{3}{4}$  in. pipe .....
- 2 galvanised wrought iron cisterns to contain 200 gallons, and fixing on and including proper bearers in roof where directed .....
- 2 Drilling holes in do. for  $\frac{3}{4}$  in. pipe .....
- 3 do. do.  $1\frac{1}{2}$  in. pipe .....
- 2 Doulton's valve closet, p.c. £5 each, and fixing .....
- 1 do. plain stoneware with water-waste preventer, and deal seat, price £3, and do. ...

- 1 enamelled iron bath, p.c. £5, including brass fittings, hot, cold, and waste, and fixing ...
- 1 glazed stoneware slopsink p.c. 34s. and allow for fixing same .....
- 1 Do. do. sink 3 ft. 6 in. by 2 ft., and fixing with back edge cut and pinned into wall and two half-brick bearers .....

- Ft.
- 39 Run.  $\frac{3}{4}$  in. wrought-iron pipe, including all joints, bends, elbows, short pieces, connectors, &c., complete, and fixing .....
- 138 " 1 in. do. all as do. ....
- No. 1 galvanised wrought-iron hot water cistern to contain 70 gallons and fixing on and including proper bearers in roof where directed .....
- 1 piece of  $\frac{3}{4}$  in. lead pipe to connect hot water cistern with cold .....
- 2 holes through iron cistern for  $\frac{3}{4}$  in. pipe .....
- 2  $\frac{3}{4}$  in. brass fly nuts and unions and fixing .....
- 3  $\frac{3}{4}$  in. do. hot water taps with label "hot" and fixing .....
- 2 connecting 1 in. wrought iron pipe with iron cistern, including holes and proper connections .....
- 2 do. do. with high-pressure boiler and do. do. ....
- Allow for attending upon and cutting away for hot water engineer .....

PAINTER.

110. *Materials*.—The paint to be composed of the best old white-lead, pure linseed oil, turpentine, &c. The work to be properly prepared and rubbed down between each coat, the finishing coat being such plain tints as the architect may direct.

111. *Ironwork*.—All ironwork to be painted four coats.

112. *Woodwork*.—The whole of the joinery throughout to be properly knotted, primed, stopped, prepared, and painted three coats.

NOTE.—The decorations, such as finishing of painting, paperhanging, also the boundary walls, have not been dealt with in the preceding specification and quantities.

PAINTER.

Use the best old white lead, pure linseed oil, turpentine, &c., for compounding the paint, properly prepare the work, and rub down between each coat and finish such tints as the architect may direct.

The varnish to be the best hard-drying copal.

[NOTE.—The next subject treated will be very interesting and original.]

## CARPENTRY AND JOINERY.—II.\*

CENTRE AND CENTRING.

BEFORE the bricklayer can arch over an opening—he is for a doorway, window, or other purpose—he usually requires the aid of the carpenter to make and set up centres upon which to "turn" the arches. It is quite true that bricklayers build centres of bricks, resting upon a plank or board, supported by upright pieces. The usual course, however, is for the carpenter to make centres to the required shape, and when the bricklayer is ready, "set" them for him. Centres are usually made of rough slabs, cut from the outside of logs, cut and worked to the required shape (often just from the "band-saw"), then nailed together and sparred across. The usual forms required are—the segmental, semicircular, Gothic, and elliptic. The method of proceeding is to lay down upon a drawing-board the required curve—say a segment—and, in order to do so, there is required the radius of the circle of which it is a segment, or other means. The following

Fig. 8

rule will serve to find the length of lath required to describe any segment. Divide the square of half the chord (span) by the height of the arc (rise of arch), to the quotient add the height of the arc, and the sum will be the diameter or twice the radius. As, for example, an opening of 4 ft. is to have a segmental arch of 9 in. rise— $24 \times 24 = 576 \div 9 = 64 + 9 = 73 \div 2 = 36\frac{1}{2}$ , or 3 ft. 0  $\frac{1}{2}$  in. This length of lath would be handy to use. Having described the curve and parallel to and  $\frac{3}{4}$  in. within it, another for spars to be nailed across ribs, allow as much space from the springing (that is, from where the curve starts from the vertical line as seen in Fig. 8), as is necessary according to weight of brick or other material of which the arch is to be built; draw a horizontal line, and you are ready. Select the slabs; if the rise is not too much, a slab of sufficient breadth may be readily got; but if not, join as shown. Make

Fig. 9

two ribs to drawing (sometimes a single rib with a piece bent round and supported by angle blocks as seen in diagram 9 will suffice, say, for a half-brick arch, or with a "reveal" and internal arch), then get out two pretty strong pieces to nail across underneath ribs, as seen in diagram 8. In nailing on spars round the curve, project them, say,  $\frac{3}{4}$  in. each side beyond rib. Nail these pieces on firmly, and in such way that the two ribs will be square and parallel in plan. In making ribs, nail any pieces which may be required to keep them together on the inside. Now nail on the spars, which may be from  $1\frac{1}{2}$  in. to  $2\frac{1}{2}$  in. broad, according to the quickness of the curve, and the centre is ready for setting up. The setting up is done by placing two uprights, one on each side, with a piece nailed on the top of each at right angles, if necessary, and one or two pieces jammed between them, as shown in Fig. 10.

The centre requires to be set level, which

\* All rights reserved.

may the more readily be done by inserting wedges (one being driven from each side) between the pieces nailed across ribs below centre and those on the top of uprights supporting centre. These wedges will serve an additional purpose. When it is required to remove the centre, after the arch is completed drive out these wedges, which will not so rudely shake the building, nor disturb the bond of the not yet firmly set arch. Another

method for segments of slight rise and moderately wide span is shown in diagram 10a. The working of this is by taking a piece of board of a length equal to the width of the span, having one edge straight, breadth at least equal to the rise of arch, square a line across the centre, which gives half the width of the span, then from the straight edge at one end mark off the rise the segment is to have, saw off and plane to a straight edge, then put in three nails, one at the rise, and one at each end of width; keep the pencil at the angle, and travel the piece against the nails, tracing with the pencil one-half of the curve; reverse the piece and trace the other half by repeating the process.

Another method is shown in diagram 10b, which is by the intersection of lines; take twice the rise and connect this point with the extremities of the span, then divide these lines each into an equal number of parts, and from the extremities draw lines to each of these points; then trace the segmental curve through the intersecting points thus obtained (the auxiliary line is seen on the right-hand side, which is used to get the parts into which the two sides of the triangle are divided). Centres require to be made for "splayed jambs" which present very little extra difficulty. Take the case of a semicircular headed window or door opening when the splay is to be continued round. A plan would be required of splays and width between jambs, as shown in diagram 11, and then two ribs would be required to be got out of different sizes, as seen in the diagram, one bevelled outwards and the other bevelled inwards from the face of the ribs (bevels seen on left-hand side of plan in diagram). The radii of the semicircles are obtained from the plan (see diagram) as also bevels. When the ribs

have been prepared, nail pieces across underneath as before described, allow spars for top, a little long (the nett length being equal to breadth of splay), and cut them off to the outline and bevel when nailed on, or take exact

length and bevels from plan and cut before putting on. They should be taper, as also the space between them, as may be easily seen on account of the ribs differing in size. This class of centres (splayed jambs) is frequently required in church work. To support a "reveal" an attachment might be made to the centre as shown in diagram 9. Gothic centres present no further difficulty when the lines of the arch are laid down on the drawing-board. Two

different kinds of Gothic arches are shown in diagram 12.

The common Gothic is based upon the equilateral triangle, and the distance between the angles is taken as the radius with which to describe the arch, and the point of meeting of the two arcs is at the third angle. The lancet arch is described by dividing the span equally, and from this centre point with a distance equal to the span, mark off on the springing line continued points, and from these points describe the arch; that is, the radius is equal to the span and half span.

The elliptic arch may be set out in several ways. The span of this arch would be termed its major axis, and the rise its semi-minor axis. Take the half span, and from the extremity of the rise intersect the span line on each side; these points would be called the foci of the ellipse, and serve as points in which to drive nails, a third nail being put in at the extremity of the rise; round these three nails stretch a piece of wire or string, fastening it when it encircles

the three nails; take away the nail at the rise, and with a pencil inside, and the wire or cord stretched to its full extent, describe the curve as seen in diagram 13. Or nail a lath having a

straight-edge along the springing line, and on the side towards the arch, another down on one side of the centre line, drawn at right angles to the springing lines. Now provide a lath a little longer than half the span, with one end at the extremity of the span; put a "bradawl" through the lath at half the span. Now put the same end to the extremity of the rise, and put another bradawl through the lath at the distance of the rise; start at the springing, and with a pencil at the end of the lath and the bradawls travelling against the laths nailed down for guides, describe half the arch; change the lath which was nailed at right angles to that along the springing line, and trace the other half of the arch; this is shown in the second figure of diagram 13. In every case when the curve of the arch is drawn, draw a line  $\frac{1}{4}$  in. within and parallel to it, which is the line to which the ribs forming the centre are made, the  $\frac{1}{4}$  in. being allowed for the spars which are nailed round and upon the ribs. In

making very large centres, very strong straps or girders are required to tie the ribs together at the proper span, and from these to the ribs are stays or braces, which serve to distribute the pressure; this is shown in diagram 14.

The second portion of the Exchange Station at Liverpool of the Lancashire and Yorkshire Railway has been completed this week. Half a million of money has been expended in the works now brought to a close, the chief portion of the heavy outlay being for the ten acres of miserable property removed to make room for the enlarged station, which has ten platform faces, each 200 yards in length. Over the entrance in Tithebarn-street has been erected an hotel, Italian in style, at a cost for erection and furnishing of £140,000.

The corner-stones of an extension of and addition to the Primitive Methodist Sunday School in South-street, Huddersfield, were laid on Saturday afternoon. From plans by Messrs. Abbey and Hanson, of Huddersfield, the old school will be enlarged, and an additional building will be erected at a cost of £500.

## OUR LITHOGRAPHIC ILLUSTRATIONS.

SKETCHES IN LUDLOW TOWN AND  
NEIGHBOURHOOD.

SHROPSHIRE, like Cheshire, is justly celebrated for its rich examples of half-timber architecture, and few parts of the county are of more note in this respect than Ludlow and its neighbourhood. The week before last we printed some drawings of Stokesay Castle, which ranks as the most interesting house in the district; and to-day we are enabled to publish some admirable sketches of six other specimens of Shropshire woodwork illustrative of the same type of buildings. These drawings, from the pencil of Mr. Oliver Baker, who is a distinguished member of the Royal Society of Painter-Etchers, have been lent us by Mr. G. Woolley, of the Bull Ring, Ludlow, from the first-rate book which he has just published under the above title. Guide-books, as usually compiled, are at best but unsatisfactory aids to the architectural tourist, and the more ponderous volumes of county histories frequently furnish less reliable information about the buildings they describe, while page after page is often occupied by tedious antiquarian matter, or long genealogical accounts of no interest whatever to the general reader. The publisher of Mr. Oliver Baker's work about Ludlow has taken a new departure from the ordinary style of topographical books, and the author has very ably realised the promoter's intentions, avoiding tedious repetitions concerning historical particulars and discarding bulky reproductions of charters, deeds, and churchwardens' accounts, has more usefully occupied the space at his disposal by describing his personal examinations of existing buildings, thus furnishing the exact kind of information most necessary to those who wish to study the actual remains which can be seen now, and thus to learn how best to see them. Accompanying his descriptions are numerous plans and maps, while most of the places of importance are graphically represented in the manner of those instances which we have reproduced to-day as specimens of the remainder. Ludlow Castle is the point to which the stranger naturally first directs his attention, and probably the earliest glimpse which he will obtain of that historic ruin will be when reaching the open square where the old red market-house stands: he sees its high, outer walls and nail-studded gate among the tall elms which now fill up the moat of Roger de Lacy's stronghold. The long series of brilliant events which make up the history of the place from the obscurity of its original foundation to the days of the popular ferment which preceded the Revolution of 1688, furnish many an important record associated with great men whose names are linked with its varying fortunes. The Norman Keep, which rises on the far side

of the inner moat, forms the chief attraction to the visitor, together with the Elizabethan bridge and gables, built by Sir Henry Sydney, adjoining the ancient tower. The circular nave of the chapel is an exquisite example of 12th century art, and one of the few of that shape now remaining. The walls inside are enriched by an arcade of 14 arches, and the chancel arch of three orders is profusely elaborated with typical ornaments of the style. The group of the castle ruins supply an extremely interesting plan. The magnificent collegiate church at Ludlow is set off by the old houses which surround it, while over all soars the great belfry tower, weatherbeaten and grim, with time-worn traceries and sculptured niches. Inside this great parish church are many monuments and some rich screens and stalls with many a grotesque miserere carving and curious sculpture. The chapels, too, deserve mention, and had we the space the building would demand a more lengthy description, such as Mr. Baker has devoted to it. The monasteries, the college, the grammar school, Barnaby House—once a resting place for Mediaeval pilgrims on their way to St. Winifred's Well at Holywell, in Wales—Dinham Chapel, the town wall, Broadgate, the Butter Cross and Domestic architecture of the town, furnish the subject matter for his next chapter. The Feathers' Hotel, of which a sketch is here given, is well known as one of the best houses of its type in the country. Its exterior is not likely to be passed by without a visit to the interior, which is equally good and interesting, with some particularly beautiful plaster ceilings (R.I.B.A. "Transactions," Vol. III., new series, plate 36). In the coffee-room the ceiling is divided by moulded beams into three compartments, which are most elaborately wrought and filled with intricate ornament. The carved-oak mantelpiece is said to have come from the castle; but whether this was so or not, it harmonises admirably with the beautiful panelling and rich ceiling of its present quarters. Its most prominent feature is the royal coat of arms with the letters I. R. for Jacobus Rex, with bold arches and pilasters flanked by grotesque figures on each side. The adjoining room has good panelling, and the Foxe arms on a carved panel over the door. There is a tradition that one Jones built the house, which may account for the initials R. I. on the picturesque lock-plate of the front door. There were several similar half-timbered houses in Ludlow, though most of them are now plastered over; but in the churchyard the Reader's house deserves mention. The old Butchers' row at the top of Broad-street contains some good work still, and there are some fine old houses in Church-street with carved panelling. In High-street is a fine and elaborate ceiling of the time of Queen Anne. In the Bull Ring is a barge-board carved to represent a hunting scene, and there are one or two good houses, including a fine one in Dinham and a few at the lower end of Corve-street. At the corner of Frog-lane is a timber and plaster almshouse built by Thomas Lane in 1674, of good form and colour. The Foxe almshouse is a long, low building in stone, dated 1593. The Old Bell at Ludford, and the Porch and Oratory at Ludford House, furnish the subjects of two other of the sketches on our lithographic plate. Ludford House, which seems to have an early history, is a very large one, built round a quadrangle, and is chiefly of timber and plaster of the Tudor period; but some of it facing the churchyard is constructed on earlier walls of great thickness. The side towards the road, in which occurs the principal entrance under a pointed arch, is chiefly of rubble masonry, and rather heavy and gloomy-looking. In the older portions there is more variety, and the side overlooking the church is eminently picturesque, with several bold projections and fine groups of chimneys. In one of the former is the oratory seen in our view. The interior of the house has been, of course, modernised in parts, but it still contains some panelled rooms of good character, and much old furniture. Below the churchyard at Ludford is the ancient almshouse of St. Giles, with its long line of roof picturesquely broken by three simple stone gables and quaint chimney stacks. The Court House and Dovecote at Richard's Castle, and the Druid's Oaks in Oakley Park seem, too, worth visiting. The walk through the last-named place leads to

Bromfield, where the Priory will well repay examination. The situation of this monastery was delightful, and the gate-house still standing marks one side of the triangular inclosure in which the buildings were erected. The church remains nearly entire, with its tower of three stages in the earliest phase of Early English work. The gate-house, of which a view from the road is here given, is a building of two stories, the lower of solid Early English masonry, with a wide and heavy arch through the centre, flanked by buttresses, and the upper of timber, now restored and used as a school-room. Wigmore is another place near Ludlow to which Mr. Baker guides his readers, giving them a full account of the castle, church, and village, afterwards taking them to Wigmore Abbey, now used as a farmhouse, but comprising some highly interesting buildings. The gate-house herewith delineated (see BUILDING NEWS for September 2nd, 1881), is an extremely picturesque piece of design eminently curious and quaint in its proportions. Beyond it is the abbey barn and pigeon-house, and in a line with it to the left are the guest-house and foundations of the abbey church. The gate-house itself is a long building of two low stories, the lower half of stone, with a stone arch through the middle reaching to the upper story, which is of timber, and projects on heavy oak brackets resting on a beam supported on stone corbels. It is now used as stables. The guest-house is of stone, and has its original roof, and retains a tall, 14th-century window on the west and a large Perpendicular one in the east end. The Tudor farmhouse was burnt down a few years ago. The half-timber farmhouse at Dodmore, of which Mr. Baker gives a sketch, is typical of good Shropshire work of this class, and the building contains one room still worth seeing for its fireplace of carved oak. The house is situated near Rock Green, and could be visited when driving from Ludlow through Stoke St. Milborough to Brown Clee and Titterstone. Culmington Church, with its stump of a spire; Elsiech Manor-house; Caynham Church, where there is a curious triple arch; Whitton Court, Stokesay Castle, Tenbury, Burford, Steventon, Orleton, Ashford Carbonell, Holgate, and Whitcliff furnish other sketches and chapters of interest, and, with the section devoted to the geology of the neighbourhood, make up the volume. To the architectural student visiting Ludlow Mr. Baker's pages are indispensable; to the library of the art lover his book will be a welcome addition, and as a model guide generally, Mr. Woodley's publication is well worthy of the occasion, nicely printed, and admirably produced. We wish more drawings such as these herewith given had been included of such subjects, for instance, as Ludlow Church.

EDINBURGH UNIVERSITY UNION—INTERIOR  
OF DEBATING HALL.

We published an exterior view of the new buildings with plans in the BUILDING NEWS for June 22nd last, and we now give an interior of the great hall. Mr. Sydney Mitchell is the architect.

## BIRMINGHAM POST OFFICE.

THIS plate to-day completes our series of illustrations of this important post-office now building. Our other drawings were given in the BUILDING NEWS for June 8 and Aug. 31, 1888. Mr. Henry Tanner, A.R.I.B.A., is the architect.

CHURCH OF ST. JOHN THE EVANGELIST,  
PUTNEY.

THE original church was designed by the late Mr. Charles Lee, and the enlargement has been designed and carried out by Messrs. Lee Bros., and Pain, of 8, Adelphi-terrace, W.C. The works comprise the enlargement of the chancel with a new chancel screen, the building of a north chancel aisle, and the enlargement of the vestry of which the first and second portions have at present been carried out. An alabaster reredos is now in progress from the designs of the architects. The accommodation of the church has been very materially increased, and the acoustic properties of the building much improved by the alterations. The cost of the works already executed has been £2,372, and a further sum of £800 is now required to carry out the enlargement of the vestries and for the choir seats. The works have been carried out by

Messrs. Adamson and Sons, builders, of Putney, and the reredos is now being prepared by them. Messrs. Hart, Son, Peard and Co. have carried out the ironwork. The reredos is to have a picture of "The Last Supper," by Messrs. Simpson and Sons, of St. Martin's-lane.

#### HALL OR CHAPEL AND CREMATORIA, ST. JOHN'S, SURREY.

THIS group of buildings to be erected for the Cremation Society of England is from the design of Mr. E. F. C. Clarke, of Westminster. The section shows the crematories and the relative position of the proposed chapel, making the most complete arrangement of the kind yet erected in this country.

#### THE MASSEY-MAINWARING COLLECTION AT BETHNAL GREEN.

THERE is now on view at Bethnal Green Museum what is undoubtedly a very splendid collection, and is, we should say, the finest private accumulation of such objects (since the dispersion of the Hamilton Palace Collection) in the kingdom. They have been lent, and carefully prepared, and arranged by the owners, the Hon. W. F. B. Massey Mainwaring and Mrs. Massey Mainwaring; and even now we understand not above half this gentleman's collection is on view.

We select a few objects of interest, but where there is such an *embarras de richesses*, the difficulty is to know where to begin and where to end. The Louis XV. Secrétaire is one of the most perfect and beautiful pieces of furniture we ever recollect to have seen; it is inlaid with coloured woods and mounted in ormolu, and in splendid preservation. The small round Table is also a good example of work in the same reign, which was noted for its beautiful furniture, before the designers adopted anything so rococo as they did later on. There is shown a Vase of Mennecey porcelain, holding porcelain flowers on ormolu stems, of Louis XV. period. The Hall Lamp next is very good in design. If nowadays manufacturers would only go straight to the fountain-head and copy some good old examples in every domestic and artistic article, what a difference it would make! The two Chalcies are worth notice as genuine examples. We have drawn them large in order that they may be well examined. They are both of the 17th-century period; the cup is silver-gilt oval, repoussé, with floral rococo ornament on spiral fluting. The Salt-Cellars are English 18th-century work, and these again would form good examples to reproduce from. The whole collection of porcelain, furniture, and silversmith's work comprises in each section some of the choicest examples extant, and will be a liberal education to anyone with the inclination and intelligence to examine them.

#### SKETCHES OF DECORATIVE FURNITURE.

WE illustrate to-day a sheet of decorative furniture, sketched at M. Edmond Kahn's, at St. Andrew's-street, Holborn. The Louis XV. Commode is genuine, of dark mahogany and tulip wood, and mounted with ormolu, chased and engraved handles, and escutcheons, surmounted by a slab of Breccia marble. The little Guerdon is modern, copied from an old example with ormolu mounts. The Sheraton Bookcase is also a copy of an old one. The Chair is Italian with stamped leather back of good design. The little Clock is Dutch, with the Bell on the top, after the style of the old clocks. M. Kahn makes a specialité of good modern French furniture, and has, as well as good examples of this, some very fine antiques that would be well worth looking into.

At the Hackney town hall on Monday evening a meeting was held for the purpose of promoting a scheme for providing North London with technical and recreative institutes. It is proposed to appeal for £200,000, the Charity Commissioners promising a similar amount, provided that this sum is raised, to erect an institute in each of the divisions of Finsbury, Hackney, Islington, and St. Pancras. Resolutions were adopted approving of the scheme and appointing local committees to put it into operation.

#### WAYSIDE NOTES.

I SEE that the competition season is commencing with its usual discouraging advertisements. There is one hailing from Cardiff, in which no hope whatever is held out that the successful competitor will be retained to carry out the job. Messrs. Cory Brothers, Limited, of Cardiff and elsewhere, invite plans and designs for new offices at Bute Docks, premiums £50 and £25, and Mr. John Cory's decision to be final. The Copenhagen competition is a slight improvement on that at Cardiff, and well worth anyone's attention, if, as I understand, it be an international affair. A premium of £800, which is the amount the successful competitor will receive, is a very liberal allowance, considering, too, that nearly the same amount will be divided between the second and third competitors. Whilst on the subject of competitions, I would express a hope that your fear that things have not gone altogether squarely in connection with the Friars' School at Bangor may be groundless. Anyhow, it will be as well if we can have definite information, as it is anything but pleasant to read that the governors have over-ruled the decision of their assessor, and adopted a design not included in the list of those favourably mentioned by the assessor.

The "Architecture of London" formed the subject of an article occupying something over two columns of the *Daily News* of the 14th inst. After a dissertation on the architectonic principles embodied in the new buildings in Oxford-street, and an assertion that Messrs. Kennedy and Francis's Art Depot, Messrs. Heath's new premises, and Duveen's shop foreshadow the rise of a new style, the writer criticised the new work in Mount-street, Grosvenor-square, and subsequently dilated on the architectural magnificence of the Victoria Embankment. Whitehall Court "is believed by some professional authorities to be the style of the London of the future." Rather a bold assertion for anyone to make! Mr. Norman Shaw's Police Offices come in for some deserved praise, and a tale is told of the blocks of granite forming the plinth being worked by convict labour. A eulogy on the houses over against the Temple Station and on the City of London schools, a rather hard slap at the School Board offices, and a wholly unwarranted rhapsody over the West-end branch of the Bank of England, bring the article to a conclusion, leaving the lay reader with a rather hazy impression that the architectural style of the future will be a cross between Duveen's Art Depot and Whitehall Court.

"The chief advocates of the return to a more formal kind of gardening," said the *Standard* of Monday last in the course of an article on "The New Style of Gardens," "are architects, and it is easy to understand why it is that they are so strongly in favour of it. They naturally think that there is 'nothing like leather,' and when they have completed the house they wish to invade the garden. It is an intelligible ambition: they sigh for other worlds to conquer." One must confess that there does exist this tendency "to invade the garden," and a very commendable desire it is for an architect to wish to arrange a beautiful garden; but we are not at all sticklers at the Italian style of landscape gardening, and a few of us, perchance, consider that the garden bears a direct ratio to the house and its size and importance. At any rate, I feel sure that an architect's garden would have none of those false, deceptive additions that ruin the effect of many so-called beautiful specimens of gardening. Affectation, undue mannerism, and deception are as destructive of effect in gardening as in a building. The article in the *Standard* was ably written and was well worth perusal, being, in general, a protestation against stiff and formal gardening where nature is subordinate to art.

The Dartford Local Board require the services of a surveyor, salary £200; applications to be made before the 27th inst.

Those who have been endeavouring to bring pressure to bear upon the "restorers" of Barfreton Church, and have been unsuccessful, have now an opportunity to go at the same sort of work in another part of Kent, not this time, a piece of curious round-arched archi-

tecture as at Barfreton, but an old church which is said to contain some of the finest specimens of 14th-century handiwork to be seen—the parish church of Milton-next-Sittingbourne. I have never entered the building, but believe it is to be visible from the L.C. and D. Railway. According to all accounts, it is at present in a very dilapidated condition, and the vicar has set on foot a movement for its restoration. The woodwork in several portions of the edifice is said to be decayed, and the old-fashioned pews are rendered objectionable by pieces of the ceiling falling into them. *New-fashioned pews*, I take it, would be equally objectionable under such circumstances. As matters now stand, Mr. W. Leonard Grant, of Sittingbourne, has prepared a scheme for the partial restoration of the church, which has been adopted, at a probable cost of £1,000.

Last Monday I was past the gate of the Farnborough Mausoleum—not much past it, as when I reached the lodge I was abruptly informed that no one was admitted to the place before 1 p.m. I cannot yet therefore say I have inspected the building in detail, but have now seen it from many points of view—from the heather-covered hills above the Long Valley at Aldershot, and from the common around Farnborough, and have made a hasty sketch from the station platform of its pretty little cupola, which rises grandly above a pine-clad knoll, forming a charming piece of sky-line that must be enchanting when seen against a glowing sunset sky. The cupola reminds me in its general outline, very much of that above the tower at the crossing of the church of St. Pierre at Coutances. GOTH.

#### CHIPS.

At the Midland Institute, on Nov. 13, the prizes were distributed to the second grade students of the Birmingham Municipal School of Art by Alderman Kenrick, M.P. The work of the year was shown to have made a remarkable advance, but Mr. Kenrick passed severe strictures upon the method in which, without adequate warning, the Education Department had disqualified the Birmingham students in the drawings for the life section of the national competition. Mr. E. R. Taylor, the head master, addressed the assembly on the development of design in schools of art.

Churchmen are particularly active in the new borough of Loughborough, and we learn that a site has been purchased on the Paget estate for the erection of a new church as soon as the necessary funds can be raised. In the meantime, an iron mission room is intended to be built.

The drainage of the village of Edenbridge is almost completed. Mr. Hill is the contractor, and the work has been carried out from plans by Mr. Jennings, engineer to the Sevenoaks rural sanitary authority.

The Montrose Memorial Committee visited the studio of Mr. Rhind, Cambridge-street, Edinburgh, on Friday, and inspected and approved of the recumbent figure of the Duke of Montrose, which will be a prominent feature in the memorial at present in course of erection in St. Giles's Cathedral in that city, to his memory. The figure (life size) has been executed in marble.

The new business premises of the Devon and Cornwall Banking Company at Sidmouth have just been completed. Extensive alterations have been made from the designs of the bank's architect, Mr. E. Lyne Parsons, of Exeter. The work has been done by Mr. M. W. Critchley, of Sidmouth.

The Bishop of Manchester consecrated the church of St. Augustine, Newton Heath, on the 12th inst. It is built in the Early English style, and at present accommodation is provided for 540 persons. The internal fittings, roof timbers, &c., are of pitchpine, and the windows are glazed with lead lights. Externally the building is faced with red pressed bricks, the moulding and tracery being of Ruabon terracotta. The total cost, including boundary fences, fittings, and furniture, is about £4,000. Mr. A. W. Smith, of St. Ann-street, Manchester, prepared the plans, and the works have been carried out by Mr. G. Macfarlane, also of Manchester.

A special committee of the Manchester Association of Engineers have prepared a course of study for youths engaged in engineering workshops, with a view to enable them to become efficient workmen. A course of reading in evening classes is indicated, and for the purpose of systematic study. The syllabus has been arranged on the basis of that of the Science and Art Department.

# Building Intelligence.

**ARMAGH.**—St. Patrick's Cathedral, Armagh, reopened on the 16th inst. after restoration at a cost of £3,000. The building was founded, it is said, in 458, was twice burned, restored in the 12th and 13th centuries, and again injured by the fires of 1428 and 1641. The fifteenth century restorations destroyed almost all that remained of the Mediaeval structure, the fall of Primate Stewart's new tower crashing the walls, and in 1834 Cottingham was employed by Archbishop Beresford to rebuild the choir, to add pinnacles and buttresses to the nave and transepts, and to make good defective masonry in plaster. The congregation, under his arrangement of the interior, was crowded into the choir, the nave being used merely as a vestibule. Mr. R. Herbert Carpenter was consulted in 1886, and under the advice of Messrs. Carpenter and Howell, the first section of a restoration has now been completed, fittings and decorations being added to be added hereafter. The work now completed has included only what is absolutely necessary to utilise the whole of the cathedral, instead of, as formerly, only the choir and south transept with one bay of the nave. To effect this object the stone-faced choir-screen, erected by Cottingham, has been removed, and the whole length of the church is thus thrown open: the screen itself being re-erected in the south transept, so as to form a choir vestry behind. The once empty area of the nave is now seated for congregations partly with the old oak benches altered and adapted for the purpose, and partly with chairs. Although the choir is very small and narrow in its proportions, it has been re-seated on a dignified plan. The primate's throne is in its proper position, at the eastern end of the south side stalls. These are five in number, with a corresponding number opposite to them. In these two blocks of stalls the Chapter are arranged. Westward of these are the seats for the choirmen, with subillæ for the boys of the choir, and westwards, again, are two stalls on either side under the choir arch for the vicars choral. The whole of the choir floor, including that of tower, has been laid with a pavement of Minton's tiles, so arranged as to increase in richness towards the east. The stall work is not yet completed, nor is the canopy of the Primate's throne yet out of the carver's hands; but the framework of the new stall fronts and some of their panels are completed, and are erected, together with some of Cottingham's stall-work. The stone holy table erected by Cottingham being both too low and small, has been covered with oak, and with a richly-traced open-work front, through which the tracery work in stone is visible. The Cottingham choir-roof has been strengthened by the addition of trusses and bolts. The roof of the south transept has been rebuilt in simple pointed arch form, with moulded panels and ribs. The heating has been partially rearranged, and includes both new pipes in benches under grating in the choir as well as coils in the aisles, and new boilers. Messrs. Musgrave have carried out these works. The contractors for the general works are Messrs. Colten Brothers, of Portadown; while Messrs. W. Bowdler and Co., of Shrewsbury, have carried out the new throne, stallwork, and vestibule. The metal work is executed by Messrs. Singer and Sons, of Frome, and Mr. Gawthorpe, of London. After the resignation of the former clerk of works Mr. Smith was appointed, and has superintended the completion of the contracts.

**BRISTOL.**—The schools which have been erected by the Bristol School Board in Easton-road were opened on Friday. They are Gothic in style, pleasantly located, and have been erected at a cost of £4,500, exclusive of interior fittings. They are built of grey Pennant stone, with freestone dressings. The interior fittings and dadoes are of pitch pine. The steps and landings are also of Pennant stone. The building consists of a centre block and two wings. In the former are eight class-rooms, four on each floor, each 29ft. by 25ft. 6in., and accommodating a total of 500 children, in four divisions. The four class-rooms on each floor are divided by glazed sliding screens, which, when thrown back, convert the space into one room, 58ft. by 51ft., for combined teaching or

drilling. The rooms are lighted by windows at front and back, and fitted up with dual desks, and separate seats for each child, with galleries for infants. The staircases are 11ft. wide, with steps 5ft. long, each step being 12in. wide, with a 6in. riser. Teachers' rooms, 12ft. by 11ft., are provided in each wing. There are two playgrounds in the rear, each 60ft. by 48ft., laid with asphalt paving, one-third of which is covered with play sheds. This portion of the work has been carried out by Messrs. Sampson, engineers, of Bedminster; the ventilation is by Messrs. Robert Boyle and Son (Limited), of London; Messrs. Hansom and Bond were the architects; Mr. T. R. Lewis, of Clifton Vale, was the contractor; and Mr. Geo. Downes the clerk of works.

**COVENTRY.**—The ground has been broken for laying the foundations of a new theatre in Hales-street, Coventry, for Mr. William Bennett. The plans have been prepared by Messrs. Essex and Nicoll, Birmingham, and Mr. C. Gray Hill, builder, of Coventry, has secured the contract for the erection of the building, the cost of which is estimated at about £4,000. The area of the main body of the building will be 108ft. by 66ft., in addition to which there will be refreshment-rooms. The stage will be 73ft. wide by 27ft. deep, with a good proscenium 24ft. wide. To the ground floor there will be three entrances from Hales-street, with a side entrance and a stage door; and there will be four staircases to the upper parts of the house and galleries. The size of the pit will be 48ft. 3in. by 53ft. 9in.

**DUBLIN.**—Dr. Walsh, the Roman Catholic Archbishop of Dublin, laid, on Sunday last, the foundation-stone of a new structure intended to increase the accommodation of St. Mary Magdalen's Asylum, Lower Gloucester-street. The new building will be a continuation of the present asylum. It will face Lower Gloucester-street with a frontage of 75ft. by 30ft. wide. The structure will be three stories high, and will be built of County Dublin bricks, with dressings of red bricks to the windows and doors, and with limestone groins and strings. Mr. William H. Byrne, of 20, Suffolk-street, Dublin, is the architect, and Messrs. Meade and Sons, Great Brunswick-street, in the same city, are the contractors.

**LEEDS.**—A new Wesleyan chapel in Dewsbury-road was opened on the 12th inst. The chapel has been built of pressed bricks, with stone dressings, in the Italian style of architecture, from designs and under the superintendence of Mr. Geo. F. Danby, of Leeds, whose plans were selected in a limited competition. It is arranged to accommodate 800 adults, and is 75ft. long, 48ft. wide, and 33ft. from floor to ceiling. All the external doors open outwards. The woodwork internally, including the pulpit, is of pitch pine varnished. The ceiling is panelled and enriched in plaster, and finished with a cove next the walls. The total cost, including the land, is about £4,200.

**TOOTING.**—The new Roman Catholic College at Tooting was opened on Monday for the reception of students. The building has been erected on the Hill House Estate, immediately adjoining Tooting Bec-common. The buildings are in red brick, with Portland stone dressings, the style being the French Renaissance. The buildings have a frontage of 196ft., the central block being 130ft. in length and 52ft. in width, while the wings are 123ft. long and 33ft. wide. The chapel, on the first floor, is 80ft. long, 30ft. wide, and 35ft. high. The altar is in Caen stone, the altar table being of white veined marble, supported by four pillars of Irish marble. Mr. W. Harvey, of Whitehall-place, is the architect, and Messrs. Higgs and Hill the contractors. The mansion, which was included in the purchase, will be used as the sanatorium of the College.

**WALLINGFORD.**—A substantial and commodious church house and Sunday-school, in connection with St. Leonard's parish, has been recently opened in Wallingford by Lady Wantage. The architect was Mr. S. C. Johns, M.S.A., of Crowmarsh, and the contractors, Messrs. Brather Bros., a local firm.—On Wednesday, the cap stone of the gable of a school house at Mongewell, a pretty and sequestered spot about two miles from Wallingford, was laid by Master Bernard Fraser, youngest son of Mr. A. C. Fraser, of Mongewell House. The

building was erected in memory of her mother by Mrs. Fraser, and is in the Dutch style. Mr. S. C. Johns, M.S.A., of Crowmarsh, was the architect, and Mr. Higgs, of Goring, the contractor.

## COMPETITIONS.

**BANGOR.**—The Friars' School competition has not yet been settled, and the referee, Mr. Herbert Carpenter, informs us that no design has yet been before him.

**BIRKDALE COMMON NEW CHURCH.**—The building committee decided to obtain designs for this church, and invited several architects to send in designs. The plans were submitted to Mr. Ewan Christian, the architect to the Ecclesiastical Commissioners, as assessor. His award has been in favour of the plans designed by Mr. J. Francis Doyle, of Liverpool. The committee accepted the award, and have instructed the architect to proceed with the work forthwith. The church will accommodate 600 worshippers.

**CORSTORPHINE, N.B.**—The Free Church at Corstorphine is to be enlarged from the plans of Mr. J. Macintyre Henry, architect, Edinburgh, whose design was chosen in a limited competition held recently. He has received instructions now to procure tenders for the work, which will so enlarge the church as to secure 140 additional seats. The organ and choir will be located in an apsidal-ended building behind the pulpit, and this wing will have a groined roof and be separated after the manner of a chancel by an arch of stone from the body of the church. The ventilation of the buildings is to form an important part of the scheme.

**HEREFORD.**—It being decided to erect as the Herefordshire Jubilee memorial a much-needed hospital for diseases of the eye and ear, plans were advertised for, and referred to the council of the R.I.B.A., who appointed Mr. Henry Currey to decide upon their merits. His award was in favour of the design marked "Spes," and its author, Mr. E. H. Lingen Barker, has been commissioned to carry out the work.

## CHIPS.

A bust of the poet Gray, modelled by John Bacon, R.A., and formerly in the collection of Stoke Pogis Manor House, has been presented by Mr. Joshua Butterworth, F.S.A., to Pembroke College, Cambridge.

Last year the inhabitants of Hovingham, near Malton, Yorks, determined to erect a new bridge, connecting the churchyard with the new cemetery, as a commemoration of the Jubilee of Her Majesty's reign, and Sir William Worsley has just laid the foundation-stone of the new structure, which is to be of stone. Mr. Randolph, of Hovingham, is the architect of the bridge, and Mr. Oldfield the contractor.

Mr. E. J. Physick, sculptor, has just erected a sculptured memorial in Sicilian marble at Long Melford, Suffolk, in memory of Hyde Parker, of the 8th King's Regiment, eldest son of Sir William Parker, Bart., of Melford Hall.

The memorial stone of new buildings for the Dennistoun Evangelical Union Church, Glasgow, was laid by Principal Morison, the founder of the denomination, on Saturday afternoon. Designed by Mr. Malcolm Scott, jun., I.A., Glasgow, the buildings, which are in the 16th-century Scottish style, are being erected in Ballochmyle red stone; they are being erected at the corner of Finlay-drive and Meadowpark-street, at a cost of about £2,600. The church will accommodate about 550 sitters, and will be provided with the usual halls and classrooms.

The new public buildings at Street, Somerset, erected in memory of the Queen's Jubilee, have been completed by Mr. Huish, the contractor. They comprise a vestry room, caretaker's room, fire brigade station, retiring room, and rooms for the parish hearse and for parish business. The buildings abut on the Crispin Hall, and are built of similar stone.

Important alterations have just been effected to the buildings on Manchester Racecourse, from plans by Messrs. Magnall and Littlewood, of that city. They include new club buildings, with balcony seated for 360 persons, new horse and saddling boxes, and enlargement of the jockeys' room. Messrs. R. Neill and Sons, of Manchester, have carried out the works at a cost of £10,000. The formal inspection by the members took place on Saturday.

## Engineering Notes.

**DUNDEE.**—Messrs. Kinnear, Moodie, and Co., Glasgow, have secured the contract for the erection of a new station for the Caledonian Railway Company at West Dock-street, the present premises being too small for increasing traffic. The new building, designed in the Scottish Baronial style, will have a frontage of fifty yards to West Dock-street, and will be provided with waiting-rooms, refreshment-rooms, booking-office, parcel-office, telegraph-office, &c., on the ground floor, the flat above being reserved for the goods manager's department and a dwelling-house for the station-master. Docks are to be provided for the arrival and departure of the trains on the main and branch lines, the main platform extending a distance of 800ft. and the branch line platform 600ft. The cost will be between £30,000 and £40,000. Messrs. Kinnear, Moodie, and Co., erected the goods station for the Company at Dundee; they also enlarged the Perth station, and are at present engaged in the construction of the railway hotel at Perth.

**HULL.**—On Thursday, the 13th inst., a new bridge across the River Hull was opened at Hull. The structure leads from Clarence-street, Drypool, to Salthouse-lane, and forms a direct means of communication between the centre of the town and the main thoroughfare to the Docks. The length of the bridge is 197ft. It is built of iron, and the whole of it is movable except a small portion at the east end. The principal span is 80ft. It is built on cylinders sunk in the bed of the river, and is worked by hydraulic power. The cost, together with the approaches and the property required, has been about £30,600. The iron-work of the bridge has been done by Messrs. Butler, of Staningley, and the quays and stonework by Mr. T. Mather, of Hull, who were the contractors. The bridge was designed by Mr. J. Fox Sharp, C.E., late borough engineer, but owing to the resignation of that gentleman, the carrying out of the work was done under the supervision of Mr. A. E. White, the present borough engineer.

### ARCHÆOLOGICAL.

**DR. SCHLIEMANN'S EXCAVATIONS AT MYCENÆ.**—The excavations commenced by Dr. Schliemann at Mycenæ are still being energetically carried on, and continue every day to bring to light fresh objects of great archæological and anthropological interest. The entire terrain around the town is full of tombs belonging to an epoch antecedent to Homer. These pre-Homeric sepulchres are cut in the solid rock and carefully formed in regular compartments, with an area of from thirty-five to forty square metres. In these chambers the dead were laid without being covered with earth, nor were they cremated, as at the time of Homer. Among the numerous objects discovered at Mycenæ in the course of the latest diggings are articles of glass, crystal, and ivory, besides precious stones with engravings of animals charmingly executed, the whole treatment being Oriental in character.

The alterations now being effected at the church of St. Andrew, Canterbury, now disused for purposes of public worship, and intended to be converted into a parish-room and Sunday school, are nearly completed. The work has been carried out by Mr. J. E. Wiltshire, builder, of that city, in accordance with plans prepared by Messrs. Cowell and Bromley, of Canterbury and Folkestone. The new vestibule and classroom is treated in very fine Renaissance, Portland stone and Bracknell bricks being the materials of which it is constructed. There is a carved frieze over the entrance, and above, in a niche, is a statuette of St. Andrew carrying his cross.

A new pulpit, constructed by Mr. B. Paylor, of Leeds, was used for the first time in Pudsey parish church on Sunday. It is Early English in style, and is of Caen stone with shafts of red Dumfries and green serpentine. The church itself was restored last year at a cost of over £1,000.

The Fearon Memorial Hall and Schools at Loughborough are now rapidly approaching completion. Mr. George Hodson, C.E., is the architect, and Mr. William Needham the contractor.

### TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

### TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.). To India (via Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

### ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 6s.

### SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

### NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLII, XLVI, XLIX, L, LI, LII, LIII, and LIV may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—E. and Son.—J. W.—C. H. M.—W. and Co.—W. W.—St. P. I. Co.—W. and Co.—C. O. J.—A. A.

J. VEALE. (They are not really wrought iron, but twisted white hot. We certainly prefer English work, such as that of Stodge and Co.)—A. ATKINS. (We do not think you will readily beat those of the St. Pancras Company, either for price, quality, or firmness.)—J. PRINCE. (Yes—a good deal of "gas"—about the description, as well as the apparatus.)—R. M. (Try Clark's siphon stove; no fine is required, and we hear it well spoken of.)—L. PARDON. (Better go to a good maker like Sax; we know nothing of the provincial firm you mention, while his prices are certainly as low, and you may depend on good work; and badly-fixed electric bells are the very mischief. Read up the series on "Electric Bell-Fitting and Construction," now appearing in the *English Mechanic*.)—W. W. (Engert and Rolfe's "long lengths" will do—they are 32in. wide.)—M. L. L. (Copper, certainly—Holden and Co., or Ewart and Co.)—J. B. B. (Won't the Bostwick folding steel gates do? See advertisement pages.)—F. D. (We don't think you'll beat West and Collier, of Hambledon, for cheapness, and they are really wonderfully strong at the price, and comfortable to sit on. Don't try the iron abominations—they may do for an Italian restaurant, but are dreadfully out of place in a church.)—ENQUIRER. (Hawley's have stood the test of time, and they feel and look comfortable, and are so easily replaced in parts.)—TEAK. (Try at Shewin's, Back-hill, Hatton-garden. He makes a speciality of hard woods, and you may reasonably depend on the stuff being well seasoned.) 2. Yes, it will go like that, and nothing seems to stop it; it's a pity, as you say, for it looks well, and otherwise wears well.)—BEACON. (Impossible to answer such questions without a personal examination of adjoining rights. This is a matter for your architect, and if he is unable to decide, for a solicitor.)—ARCHITECT, Omaha. (On the whole, we think the Hoffmann Kiln is superior.)

## Correspondence.

### ARCHITECTS' MISDEEDS.

To the Editor of the BUILDING NEWS.

SIR,—Lord Grimthorpe is always a safe "draw" in an architectural paper (see "B.N." of Friday, p. 359), though others than architects can give him credit for good works—e.g., the *Church Times* of this week in its first leader; but I never see the misdeeds of architects shown up in professional papers. Your correspondent

with the A.A. excursion last month, for instance, praises young Scott's reredos in Bakewell Church, but he quite omits to censure the treatment of the ancient sedilia which he has left useless by his alteration of levels. The eastern one is too high, the western too low, and the middle one blocked by his new altar rail; he has, moreover, removed the foot plate.

Did any architectural paper condemn the elder Scott's treatment of the choir of Ripon or Street's of the pavement of Hedon Church or his burying the Norman font at Garton? Kirkburn to make way for an alabaster one of his own, or his roofing the "strong room" of Dublin Cathedral with lath and plaster? Could quote scores of such bungles committed by professional men great and small. Did the "B.N." ever mention them? I trow not. Wonder, then, if Lord G.'s opinion of the profession and its organs is spreading among people who care to think for themselves.

W. H. M. ELLIS, M.A. Cantab.  
University Club, Dublin, Sept. 17.

### THE LONDON SCHOOL BOARD REPORT.

SIR,—One of your contemporaries, in commenting on the references to the late architect's department, takes rather a one-sided view of the case.

It was, I think, a fact that when Mr. Robson was appointed he was to give the whole of his time to the duties of the office—a condition which prevented many eminent architects from offering themselves for the appointment. For a short time this condition was relaxed, and we find Mr. Robson engaged in competition, &c., and making a good private practice. If Mr. Robson found that he could not properly perform the heavy duties of his office and his private practice, surely it was his duty to lay the matter before the Board.

I may add that Mr. Robson is a stranger to me; but, as a ratepayer, I cannot help thinking that somebody should have seen that the work was carried out according to the drawings and specification.—I am, &c., RATEPAYER.

### ARCHITECTURAL PLAGIARISM.

SIR,—Perhaps I should apologise to Mr. Hall for having so moved him; but really I had no idea that the few words in mine of the 7th inst. would have had such a disturbing effect!

I confess my inability to enter into the maze of evolution which he indulges in. I do not see the connection with the point at issue. When I used the word "plagiarism," it was in its broadest sense, and I had not Mr. Hall's examples before me.

I may not have been quite explicit; but in taking up and using Mr. Hall's own words, meant to infer that if a man did not possess "ideas" and "individuality" of his own in architecture, he was safer to borrow (or steal) from some recognised master than trust to his own abortive attempts; for verily a thing of beauty (though stolen) may be a joy for ever, whereas an abortion, however much bearing the mark of individuality, can never be so, but an eyesore for ever.

I love originality, but I like it to be good. I cannot agree with the dogma that any style is better than none simply because a man is individualised by it. I cannot accept originality at any cost.

I still maintain that the best and most original men of the day are those who by patient study and heartfelt work have succeeded in collating and moulding into concrete form the abstract ideas of master minds that have gone before.

I would remind Mr. Hall that originality may be strained and become absurd; instance his fearful joke on my innocent name! What is the "soaring" flight of ideas here? What an awful descent he had to make, and what a drain upon his imagination, when he had to descend to that "Culvert"! I am afraid your readers will require a surgical operation performed upon them ere they can see to the depth of this joke!

I must apologise for again intruding upon your valuable space.—I am, &c., EDWARD CALVERT.

### WORKMEN'S DWELLINGS AT AINTREE.

SIR,—I see that you state last week that Mr. J. W. Mee, Manchester, was awarded the second prize; this is, unfortunately, incorrect

use the designs of Messrs. Sugden and Mr. were considered of equal merit, though being in excellence in various points, and each awarded 50 guineas, which was the amount of the first prize advertised, so really there was no second premium awarded, but the first prize was awarded in the usual way.—I am, &c.,  
WM. P. HARTLEY.  
Intree, Liverpool, Sept. 18.

## STRAINS.

RE,—In a letter which appeared in your issue "C. A. B." very clearly explained the matter under discussion, and has shown me where and how the difference has arisen, it being one of definition only. Under the term "near" I have included cross compressional strains caused by compounding what he calls R. and L. shears. To do so was possibly an error of judgment; but these strains are so easily considered, and are so readily taken and signed for concurrently with the shears, that I consider myself to have been justified in using one diagram.—I am, &c.,  
G. A. T. MIDDLETON.

## COMPULSORY EXAMINATIONS FOR SURVEYORS TO SANITARY AUTHORITIES.

SIR,—"Goth," in his Wayside Notes, calls attention to the above subject, and informs our readers of a note in the R.I.B.A. Journal to the effect that if surveyors to sanitary authorities were compelled to pass a qualifying examination, "jerry building" would cease to exist.

Having been an assistant in local board offices in different parts of the country, I have had many opportunities of peeping behind the scenes, and I am strongly led to think that the establishment of a compulsory examination would be the first nail, and a very tenacious one, in the coffin of jerry building.

Many of your readers would be astonished were they to see some of the plans that are submitted to local authorities for approval. I have seen plans that had been "passed" which showed rooms, but had no means of getting light or lighting them. Can this sort of thing be wondered at if they have to be submitted to surveyors who know so little of plan drawing as not to be able to detect the error?

If plans are passed so easily and such slipshod drawing accepted, there is no wonder "jerry-buildings" are also passed, and slipshod work outside accepted.

Many of these wonderful specimens of draughtsmanship are submitted without the name of the architect, or, more correctly, I hope, the person who makes the drawing. The model by-laws issued by the Local Government Board contain no clause to compel this, which I, I think, an important omission.

If surveyors were compelled to pass an examination, it would bring about some degree of uniformity in their requirements—a desideratum the benefit of which would be strikingly felt in the suburbs of London and other large towns where houses are built irrespective of the parish boundaries.

An instance occurs to me which illustrates the inconvenience of this difference of opinion. In a road in the northern suburbs of London the houses have been nearly all erected by one builder; but half are in one parish and half in another. One surveyor insists upon an "interceptor" being inserted in the drain; the other not only does not insist, but will not allow, an "interceptor" to be put in. Verbum sat.

Some surveyors will say that the powers given them by the by-laws are very limited in regard to the prevention of "jerry building." With this I agree; but if the ranks are purged of the incompetent ones, there would not be that necessity to curb their powers at present so desirable.—I am, &c.,  
AN ASSISTANT SURVEYOR.

## DISCREPANCIES IN SURVEYORS' VALUATIONS AT PONDER'S END.

SIR,—Referring to the report in your last issue, I may explain that the question under consideration was the damage done to two acres of land suitable for building by its being crossed (partly in a diagonal direction) by an effluent sewer.

Your readers can form their own ideas as to

the effect on the value of land, especially when it is considered that the drain discharges into a brook which fills rapidly, and frequently stops the outfall altogether.—I am, &c.,  
HENRY LOVEGROVE.

## LYDFORD CHURCH.

SIR,—As one amongst many who take a deep interest in Lydford Church, allow me to make a few remarks. I was astonished to read the letter of "Curious," and of the way in which the parson had played fast and loose with the plans of three previous architects. I believe Mr. W. S. Hooper is an architect; and, if so, I suppose the church is in safe hands, and that the first account I heard—namely, that a country mason or builder was about to be let loose in the church—is incorrect.

The church is of considerable interest, and is dedicated to St. Petrock. It consists of chancel and nave, with south aisle, south porch, and west tower. It is mainly Perpendicular in style. The font is Early Norman, and the roof Perpendicular, of the usual cradle type, with moulded ribs and bosses. The nave is separated from the aisle by an arcade of four bays. There are two piscines. The S.W. angle of the chancel is pierced by the rood-stairs, two of the steps of which are pierced to form a squint, a very quaint combination. Chairs have taken the place of the "deal tanks."—I am, &c.,  
STILL MORE CURIOUS.

## CHIPS.

Mr. David Patrick, of Ward, Dalry, died on Friday night in his seventy-third year. Mr. Patrick was very widely known throughout Ayrshire, having acted as district road surveyor for the long term of fifty years. In Mr. Patrick, says the *Scotsman*, the Road Trust have lost a shrewd and painstaking surveyor, who knew his business in every detail.

The tower of the parish church of Burnham, Somerset, has been restored, a work carried out by Messrs. Harding Brothers, of that town, and the bells have been rehung by Mr. Stokes, of Woodbury, Exeter.

The wills of the great railway engineers of North Wales, Benjamin Piercy and Henry Robertson, M.P., who were closely associated in all projects affecting the northern portion of the Principality, and who died within two days of each other in March last, have just been proved. The personal estate of Mr. Piercy has been declared at £324,574, and that of Mr. Robertson at £185,528.

The disused grammar school at Stroud, Gloucestershire, has been altered and refitted at a cost of over £700 to serve as a free library, and was reopened with a nucleus of 3,300 books on Saturday last.

The new Queen's Theatre at Longton, Staffs., was opened on Monday week. The principal or Commerce-street front of the theatre is of red stone, the design being Free Renaissance. The stage is 68ft. wide by 48ft. deep, the proscenium being 27ft. wide and 34ft. 6in. high. The architect of the theatre has been Mr. J. Taylor, of Longton, and the builder Mr. T. S. Bromage, also of Longton.

A new Baptist chapel in Oxford-road, Moseley, built from plans by Mr. J. P. Osborne, of Colmore-row, Birmingham, which were chosen in competition, was opened on Friday. The style is Decorated Gothic, the plan is cruciform, and the chapel is seated for 600 persons, with lecture-hall adjoining accommodating 250. A spire is built at the north-west angle, that next the road. The contractor was Mr. William Bloore, and the cost has been £7,500.

A marble memorial has been erected on the grave, in Woolston Cemetery, Southampton, of the late Professor de Chaumont, F.R.S., the well-known Professor of Military Hygiene at Netley. It consists of a massive headstone, resting on a base, enriched with carved crockets in low relief around the edges. The grave is inclosed with a marble kerbing, with broadly chamfered edges. The memorial is the work of Messrs. Garrett and Haycom, of East-street, Southampton.

The Edinburgh water trust received at their last meeting a report from their engineers, Messrs. Leslie and Reid, stating that additional sources of supply would have to be sought ere long, as the trust is scarcely able to meet the demands upon it. A description of five different schemes were given, the Manor Water and St. Mary's Loch being indicated as not likely to yield good results. On the motion of Sir James Gowan, Dean of Guild, the engineers were instructed to bring up a detailed report on the various sources of supply available.

## Intercommunication.

## QUESTIONS.

[9753].—**Water Tables.**—A subscriber would be glad to know of a book of tables or ready reckoner that will give the number of gallons of water per minute over a gauge 6in. in width by the depth.—T. R., Dilworth, Newcastle, Staffordshire.

[9754].—**Professional Charges.**—Will some kind reader oblige me by informing me what professional fees I am entitled to for the preparation of preliminary sketches, working drawings, and specification, and procuring offers for a range of artisans' dwellings which my client is not to erect? Are the charges laid down in Hurst's such as would stand the test of a Court of Justice? An answer in detail from some experienced member of the profession would relieve the difficulty of—FRAGEN.

[9755].—**Baywood.**—What is the difference between baywood and mahogany? I have consulted several people, some of whom say that baywood is a mahogany of a softer, lighter, and cheaper quality, whilst others say that it is a different species of wood, and not mahogany at all. An explanation will be esteemed a favour.—AJAX.

[9756].—**Salt Glazed Tubes.**—I shall be glad to learn the reason why salt-glazed fireclay flue linings and chimney-pots are liable to crack when subjected to great heat, and whether there is a remedy in mixing the clay, &c.—ONE IN A FIX.

[9757].—**Overhanging Trees.**—Where the land belonging to one person is overshadowed and covered by the overhanging branches and foliage of trees belonging to neighbouring property, has the one aggrieved a right to lop off the offending branches, or what other remedy is there to rid himself of the intrusion?—FAIRATION.

[9758].—**Wet in Cellar.**—A house built on a slope has a cellar which in wet seasons gets filled with several inches of water that rises through a brick flat floor with grouted mortar joints. The cellar is sunk in a shaley kind of rock, and when house was building sky-water was disposed of by sinking a pit (3ft. each way) and filling in same with rubbish. Would the wet come into cellar if this pit was filled in with cement concrete? But if this were done and the floor brick joints pointed with cement, might not the water force its way through the mortar joints of the 18in. stone cellar walls, which at present is not the case?—C. E.

[9759].—**Pantiles.**—What is the reason that pantiles are not more largely used? Can they not be relied upon to keep out a driving rain at a pitch of 45 degrees?—C. F. M.

[9760].—**House Drains.**—Where only a very slack fall can be obtained (say, 1 in 300), would not a 6in. drain be preferable to a 9in., and clear better?—SANITARY.

[9761].—**Red Building Stones.**—Will some readers kindly give their experience of the various red building stones used in London, and relative cost, &c.?—ENQUIRER.

[9762].—**Pressure on Dam.**—What will be the pressure per square foot on a vertical dam at 12ft. below surface of fresh-water reservoir? Please show method of walling.—CONSTANT SUBSCRIBER.

## REPLIES.

[9700].—**Quality of Woodwork.**—I am obliged by the trouble taken to answer my inquiry; but could some practical reader state the best wood to specify for some practical reader state the best wood to specify for a carpenter and joiner's work, separately if necessary, and a method to tell, if possible, when the right wood is being used for ordinary purposes, so as to have clean, sound, and stable work? I should also be glad by a closer attention to the latter part of my inquiry as to carpenter and joiner's work being kept entirely free from sapwood, and shakes, and large knots, and all other defects. Is there such a thing for building purposes as wood entirely free, or should the clause be understood in carrying out work to be very or fairly free, and how is one to get over the difficulty when clients are quibbling as to paying for work on some slight defect natural to the wood revealing itself at completion of contract?—FAIRATION.

[9752].—**Highest Spires in South London.**—The three highest spires within the metropolis south of the Thames, are: (1) Christ Church (Rev. Newman Hall's), Westminster Bridge-road and Kennington-road, built 1875-6, from the designs of Messrs. Paull and Bickerdike; height of "Lincoln" memorial tower and spire attached to the church 220ft., square at base 29ft.; an illustration of the church and tower appeared in the BUILDING NEWS for Jan. 1, 1875, and details of entrance on Feb. 5, of same year. The central fleche of same church is 140ft. in height. (2) St. Giles's Parish Church, Camberwell; rebuilt 1841-4 from designs by the late Sir Gilbert Scott and T. Moffatt; central tower and spire, 207ft. high, 30ft. square at base. (3) St. John the Divine, Vassall-road, Brixton, the late Mr. G. E. Street, R.A., architect; the tower and spire are now being added under Mr. A. E. Street's superintendence; the former, of red brick, is 108ft. high, and 25ft. square at base; the spire of stone, just commenced, will rise 104ft. higher, making total altitude from ground 212ft.—EAST ANGLIAN.

Surveyors have been busy this week going over the route of a proposed new railway which will run from the Midland system between Ingrow and Cullingworth, and the railway near Preston on the southern side of the Ribble. The new line will connect the district of Colne, Sadding, Whalley, and Walton-le-Dale, and will be known as the North-West Central Railway. The engineers are Messrs. Henry James Fraser and Mr. Beswick Myers, Leeds and Westminster, and Mr. Samuel Utley, Halifax. The total length will be between 30 and 40 miles.

### WATER SUPPLY AND SANITARY MATTERS.

**CARDIFF.**—The mayor and corporation proceeded on Friday to the Taff Fawr Valley in order to make the annual inspection of the new waterworks now being erected in that district. The party, under the guidance of Mr. J. A. B. Williams, the waterworks engineer, inspected the whole of the workings, noting the progress that had been made since the last visit, fifteen months ago. This, it is stated, was thought somewhat slow, especially as the time stipulated in the contract expires next January. The advance made since the former visit is that the discharge tunnel has been completed, and the river has been so diverted as to run through the tunnel. This was all finished in September last. The main trench across the valley has been proceeded with, the excavations in this case being very formidable, from the fact that a great amount of cutting has to be done before getting at water-tight material. This trench has been completed on the western side of the tunnel, and attention for the most part is now being directed to the eastern side. In addition to the trench on the east side, a bye-wash and an overflow weir will have to be made. These, with the embankment, are the most important items in the work remaining to be done.

**SOUTH AFRICA.**—The De Beers Consolidated Mines (Limited) obtained a Bill during the recent sitting of the Cape Parliament for the construction of a scheme for the supply of water to the Township of Beaconsfield (adjoining Kimberley) and the adjoining mines of the locality. The supply will be about one million gallons per day, which will be pumped from the Vaal River, a distance of 14 miles, to a service reservoir near the town, which will contain ten days' supply. The total rise from the river to the reservoir will be 500ft., and a head of water of about 100ft. will then be afforded to the distribution for mines and municipal purposes. Mr. Sydney Stent, M.Inst.C.E., is the engineer of the scheme, and his estimate of cost is about £140,000, which will include a perfect scheme of filtering for the municipal supply. The opposition of the Kimberley Waterworks Company to the Bill was most persistent all through its several stages in both Houses, and its final passing was only accomplished a few hours before the proroguing of Parliament.

**WOLVERHAMPTON.**—The chairman of the Corporation Sewerage Committee laid on Thursday, the 13th inst., a memorial stone at the Barnhurst Sewage Farm in connection with the precipitation works which are being executed there for the purpose of purifying the sewage of the borough, and thereby avoiding the claims made upon the corporation for compensation for injury done to land and crops adjoining the Pendeford Brook, into which the effluent from the sewage farm falls. The most serious difficulty which the committee have had to contend with has been the spent acid and other waste refuse which have been sent down the sewers from various works in the town, and in order to neutralise the injurious effects of the acid the sewage will be mixed with milk of lime before being passed into the precipitation tanks, where it will be dealt with on the quiescent and continuous system. The works are being carried out from plans by Mr. R. E. W. Berrington, the borough engineer, at a cost of £5,600, Mr. Herbert Holloway being the contractor.

A serious slip has occurred in the north wall at the deeper water dock now constructing at Southampton. The wall, which is of concrete, is 850ft. long and 30ft. thick at the base, and about 300ft. run of this has been pushed bodily forward by lateral pressure, the wall itself remaining upright and virtually intact. Mr. Alfred Giles, M.P., engineer to the Dock Company, was telegraphed for, and under his instructions the contractors, Messrs. Pearson, are relieving the pressure on the damaged wall by the removal of the backing so as to prevent the mishap extending.

On the 9th inst. the R.C. Archbishop of Glasgow opened a new Catholic school situated on the west side of Sandfaylls-street. The building was designed by Messrs. Pugin and Pugin, of Westminster. Red sandstone, with rock facing, is used for the front of the building, and vitrified bricks are the material put into the gables and back portion. The school is 116ft. long and 34ft and 76ft. in height. The contract price for the building, which accommodates 1,300 children, was £5,000.

At a meeting of the Crediton School Board, held on Tuesday, Sept. 11th, it was proposed to erect new schools at Hookway, Crediton, and Mr. Charles Cole, M.S.A., of Exeter, the architect of the school recently opened at Coplestone, was instructed to prepare plans for the approval of the Board.

The parish offices, Dudley, are warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester and London.

### STATUES, MEMORIALS, &c.

**DUNDEE.**—On Saturday afternoon the Primus dedicated a new marble credence table, piscina, and aumbrey, which has been erected on the south wall of the sanctuary of St. Paul's Episcopal Church, Dundee, in memory of the late Sister Margaret Mary of St. Mary's Sisterhood, King-street. The memorial has been executed by Messrs. Farmer and Brindley, sculptors, London. It consists of a shelf of red Irish marble, which is divided into two recesses, the eastern forming the credence table and the western the piscina with an aumbrey attached. It is inclosed with slabs of alabaster, and an oak door having ornamental hinges of wrought iron. The canopies are formed of polished alabaster, beautifully veined and carved with foliage and marguerites, under which is an inscription.

**EDINBURGH.**—THE HARRISON MEMORIAL.—The Earl of Rosebery formally inaugurated, on Friday, at the east entrance to Blackford Hill, the arch erected as a memorial of the late Sir George Harrison, M.P., LL.D. The gateway, which was designed by Mr. Sydney Mitchell, architect, is Classic in style. In the centre is an archway for carriage traffic, 13ft. wide and 17ft. high to the crown. This is flanked on each side by two Ionic columns standing on pedestals, and between these columns two small archways, 4ft. wide and 9ft. high, are pierced for foot passengers. At the level of the spring of the large centre arch the gateway is divided horizontally by a moulded string, and the gateway is finished at the top with an architrave, frieze, and cornice. The cornice is broken above the capitals of the columns, and over the central pair of these rises a triangular pediment. In the space contained in this pediment is a moulded circular panel, in which is a bronze medallion of Sir George Harrison, by Mr. M'Bride, sculptor—the face being a replica of the bust in the Council Chambers, Edinburgh. The whole gateway measures 36ft. in length, and 30ft. high. On the frieze over the central archway, and just underneath the medallion, is carved the inscription.

### CHIPS.

Messrs. Hayward Tyler and Co., of 84, Whitecross-street, London, E.C., now undertake the complete fitting-up of private houses, public buildings, factories, &c., with the electric light. The department is under the charge of Mr. C. P. Hammond, an experienced electrician, and they will be glad to receive inquiries from parties requiring such work done.

Mr. Sydney Stent, F.R.I.B.A., of Kimberley, S.A., has been commissioned to design a new cathedral for Pretoria, the capital of the Transvaal Republic. The total cost will be about £20,000, but it is probable that only a portion of the complete design will be carried out at present, and such portion will be adapted for use in connection with the present pro-cathedral.

On Monday last Mr. J. Edwards was elected curator of the Royal Architectural Museum, in the place of Mr. Edgar Varley, deceased. Mr. Edwards was for 25 years an assistant in the offices of Messrs. Slater and Carpenter. There were several candidates for the post.

A large clock, striking hours, chiming the Westminster quarters, and showing time on two large dials, has just been erected at Willey Park, Shropshire, to the order of Lord Forester, by John Smith and Sons, Midland Clock Works, Derby. It is fitted with all the latest improvements, and is expected to go with extreme accuracy.

All the French national museums—viz., the Louvre, the Luxembourg, Versailles, and St. Germain—together with all objects of art in State buildings throughout France, have just been placed under the charge of a single director, whose headquarters will be at the Louvre.

The gifts of Sir John Savile to the National Gallery are now on view. They consist of No. 1255, "Still Life," by Jan Van de Velde; 1256, "Still Life," by H. Steenwyck; 1257, "The Birth of the Virgin," a sketch by Murillo; and 1258, by Jean B. S. Chardin. The copies of Velazquez's works are hung in the basement at Trafalgar-square.

Among the adjudications in bankruptcy announced in Tuesday's *Gazette* the name occurs of Sydney Birbeck, Nottingham, architect and surveyor.

The foundation-stone has been laid at Tralee of a new church of St. James. The building will be Early English in character, and will consist of nave with aisles, transepts, and chancel, and a future day a tower and spire, rising to a height of 150ft., will be added. Accommodation is to be provided for 1,600 persons at a cost of £7,000. Mr. R. Devlin, M.A., of Dublin, is the architect.

The partnership between Sage and Oxley, of Gray's Inn-road, builders, has been dissolved.

### Our Office Table.

THE picturesque 12th-century ruins of the Clunian Abbey of Kirkstall, now within suburban Leeds, have been in the market for some time, and fears have been entertained lest some wealthy and ignorant cloth manufacturer should purchase the remains and vigorously restore or possibly demolish them. The present owner, the Countess of Cardigan, has thrown out the hint that some man of means should buy them and convert them into a cathedral for Leeds; happily, however, the well-to-do and shrewd Churchmen of the district have not jumped at the suggestion. A paragraph went the round of the papers a few weeks since stating that Sir John Lubbock had acquired them; but this proved unfounded. We are glad to hear that the ruins will probably be obtained for the town—a syndicate of local gentlemen having formed themselves into a committee with the object of purchasing the estate, with the view of its being subsequently acquired by the town, or settled under some other disinterested trust, under provision that would secure the necessary steps being taken to stop the further destruction of the abbey, to provide for its protection and maintenance in future, and to insure the dedication of the abbey and grounds to the use and enjoyment of the public for ever. The committee has opened negotiations for the purchase of the estate, and one of its members has engaged to advance the necessary money if terms of purchase can be agreed upon.

The first annual exhibition of the South Wales Art Society, established some eight months since mainly through the energy and zeal of Mr. Edwin Seward, R.C.A., was opened at Cardiff on Saturday. The collection, which is hung in the Queen-street Public Hall, is an excellent one for an initial effort, and numbers several hundred oil-paintings, water-colour drawings, and pencil sketches. The place of honour is occupied by H. Stacey Marks's portrait of Sir Morgan Morgan, the ex-Mayor of Cardiff, and below it is hung a water-colour scene from the Highlands, by Walter Severn, a vice-president of the society. H. Clarence Whaithe, P.C.A., sends two Snowdonian landscapes. The oils include works by G. F. Watts, James Sant, and Seymour Lucas; Welsh landscapes by B. Williams Leader; some figure subjects by J. D. Watson; Jackson Curnock's strongly coloured sketches; and those by T. H. Thomas, Alfred de Breanski and Albert Stears are worthy of notice. Architectural sketches and drawings are contributed by E. Seward, S. W. Williams, E. H. Bruton, C. C. Jones, and Habershon and Fawcner. The chief exhibitors of sculpture are Milo Griffith, H. Hampton, and W. Gascombe John.

THE death is announced at the comparatively early age of 38 years of Mr. James Stafford Murchie, the active secretary of the Amalgamated Society of Carpenters and Joiners. Mr. Murchie, who died at his residence in Brunswick-street, Manchester, on Wednesday in last week, was born in Carlisle, and at an early age removed to Manchester, where he was put to the trade of a carpenter and joiner. Being of a studious habit, he soon made a considerable acquaintance with literature, and gave special attention to all questions affecting the working classes. At an early age he was firmly convinced of the value of organisation as a means of enabling the men of his own order to hold their own in the contest with capital. He actively engaged in the society connected with his own trade, and in 1876, although only 26 years old, he was appointed chairman of the committee which conducted the memorable strike of that year. The movement was a failure, and Mr. Murchie and other prominent actors in it suffered much in consequence. On the appointment of Mr. J. D. Prior as factory inspector in May, 1880, Mr. Murchie, who at that time held the office of chairman of the Executive Council of the Amalgamated Society of Carpenters and Joiners, was elected to the office of secretary vacated by Mr. Prior, and was subsequently re-elected each year. The great depression which has prevailed during his term of office has caused a very heavy drain upon the funds of the society, and furnished considerable reason for anxiety on the part of

responsible officers. Mr. Murchie bore his part in this work with an unflinching cheerfulness, and a brighter day seemed to be dawning at the time of his fatal illness. Last week he attended the Trade-Unions Congress at Bedford, and in moving a resolution on the players' Liability Bill spoke with his usual force and fluency; and he also spoke later in the week, when the usual severe competition took place for seats on the Parliamentary Committee, and when he was elected sixth on the list out of 24 candidates. The funeral took place at Ardwick Cemetery, Manchester, on Saturday, and was attended by the chairman and all the members of the executive council, Mr. George Shipton, president of the Trade-Unions Congress, Mr. Slatter, the treasurer, and other representative trade-unionists from parts of the country.

THE medical officer of health has within the last two months condemned as unfit for human habitation some wretched and squalid tenements in Windsor, situated in the Oxford-road; and last week some more of the demoralising type in Distil House-row, a court adjacent to Thames-street and the Curfew Tower. In the latter "slum," which is situated within 100 yards of Windsor Castle, a fatal case of diphtheria has just occurred. Events are thus at once vindicating the efforts which the Rev. Arthur Robins has been making for years past to deliver Windsor from the stigma and danger of dwellings which are tardily pronounced, officially, to be unfit for human habitation. Is it too much to hope that, for Windsor's good name and prosperity, this is the beginning of the end "of these horrible and heartrending homes"?

A PUBLIC meeting of those interested in the expediency of registering plumbers, was held in the Town Hall, Stockton-on-Tees, on Friday evening. The Mayor occupied the chair, and was supported by Professor Garnett, Principal of the Durham College of Science, and Mr. L. I. Armour, Secretary of the District Council. The Mayor, in opening the meeting, said that the proposed society was not formed in the interest of the trade, but to promote public health, and with the view of placing the plumbing craft on a higher basis, and also to provide a better class of workmen. What was required in sanitary matters, so far as plumbing was concerned, was not to have cheap work, but to have really good and efficient work. Mr. Armour stated what had already been done in Newcastle-on-Tyne. Councillor Hind, the Master of the Plumbers' Guild, explained the object of the society. Professor Garnett said that bad and defective plumbing were caused not so much from want of honesty as from the want of the knowledge required to carry out the work satisfactorily. Mr. Ald. Cragg was elected the public representative of the society for Stockton; Messrs. Jno. I'Anson and Geo. Simpson were appointed representatives on behalf of the operatives; and Mr. John Swain was appointed the masters' representative.

A GATHERING of the Fellows of the Surveyors' Institution, resident in the counties Palatine of Lancashire and Cheshire, was held in the meeting-room of the Manchester Society of Accountants on Tuesday to further the formation of a provincial committee of the Institution for the two counties on the basis of the scheme for the local organisation of members throughout the provinces, which is in course of gradual development by the council. The secretary of the Institution explained in detail the constitution of the new committees, and the objects the council have in view in their formation. Mr. J. Cross, of 77, King-street, Manchester, to whose hands the preliminary arrangements were confided by the council, was unanimously elected chairman of the committee for the ensuing year. In the exercise of the discretion vested in the meeting by the rules of procedure, it was resolved that the committee be designated the "Provincial Committee of the Surveyors' Institution for the Counties Palatine of Lancashire and Cheshire." After the completion of the formal business of the meeting, the committee proceeded to consider the arrangements for the preliminary examination for the admission of students to the Institution, to be held at Manchester under the auspices of the committee on the 22nd and 23rd of January next, Messrs. J. Holden, T. Silk Wilson, S. J. Bridgford, and T. A. Dickson being appointed moderators for the purpose.

## CHIPS.

An organ which has just been placed in Partick parish church, Glasgow, was inaugurated on Sunday. It was built by Mr. J. J. Binns, of Bramley, Leeds, and cost £700.

A sub-committee of the Edinburgh town council has recommended that body to invite models in competition for the statues of Wallace and Bruce proposed to be erected in that city on the Princess-street Esplanade. The intended outlay on the statues is £3,000, and no premiums will be given in the competition.

A mission chapel and keeper's house for the Welsh Calvinistic Methodists were commenced a few days ago at Garston. Mr. Joseph Rawlinson, of Wellington-street, is the sole contractor, and the works are being carried out under the supervision of Mr. Frederick H. Peate, of Liverpool.

New police buildings have been erected at Francis-street, Westminster, and special attention has been paid to the ventilation, Messrs. Robert Boyle and Son's latest improved patent self-acting air-pump ventilators being adopted for the extraction of the vitiated air.

The annual exhibition of architectural photographs taken by Mr. John L. Robinson, A.R.H.A., of Dublin, illustrative of the A.A. excursion, will be opened on Monday next, the 24th inst., at the Royal Architectural Museum. The series of views number between one and two hundred.

Holloway's Pills purify the blood, remove all obstacles to its free circulation through the lungs, relieve the congested air tubes, and render respiration free, without reducing the strength, irritating the nerves, or depressing the spirits; such are the ready means of escaping from suffering when afflicted with colds, coughs, bronchitis, and other chest complaints.

Garside's Noted Bedfordshire Coarse and FINE SILVER SAND.—Is perfectly free from impurity, and the best and cheapest in the market.
